Example: Configuring an additional metric for a RIP interface

Network configuration

As shown in Figure 4, run RIPv2 on all the interfaces of Switch A, Switch B, Switch C, Switch D, and Switch E.

Switch A has two links to Switch D. The link from Switch B to Switch D is more stable than that from Switch C to Switch D. Configure an additional metric for RIP routes received from VLAN-interface 200 on Switch A so Switch A prefers route 1.1.5.0/24 learned from Switch B.

Figure 4 Network diagram

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] rip 1
   [SwitchA-rip-1] network 1.0.0.0
   [SwitchA-rip-1] version 2
   [SwitchA-rip-1] undo summary
   [SwitchA-rip-1] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] rip 1
   [SwitchB-rip-1] network 1.0.0.0
   [SwitchB-rip-1] version 2
   [SwitchB-rip-1] undo summary
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchB] rip 1
   [SwitchC-rip-1] network 1.0.0.0
   [SwitchC-rip-1] version 2
   [SwitchC-rip-1] undo summary
   ```

   # Configure Switch D.

   ```
   <SwitchD> system-view
   [SwitchD] rip 1
   [SwitchD-rip-1] network 1.0.0.0
   [SwitchD-rip-1] version 2
   [SwitchD-rip-1] undo summary
   ```

Configure Switch E.

```
<SwitchE> system-view
[SwitchE] rip 1
[SwitchE-rip-1] network 1.0.0.0
[SwitchE-rip-1] version 2
[SwitchE-rip-1] undo summary
```

Display all active routes in the RIP database on Switch A.

```
[SwitchA] display rip 1 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, nexthop 1.1.2.1, RIP-interface
       1.1.3.0/24, cost 1, nexthop 1.1.1.2
       1.1.4.0/24, cost 1, nexthop 1.1.2.2
       1.1.5.0/24, cost 2, nexthop 1.1.1.2
       1.1.5.0/24, cost 2, nexthop 1.1.2.2
```

The output shows two RIP routes destined for network 1.1.5.0/24, with the next hops as Switch B (1.1.1.2) and Switch C (1.1.2.2), and with the same cost of 2.

3. Configure an additional metric for a RIP interface:

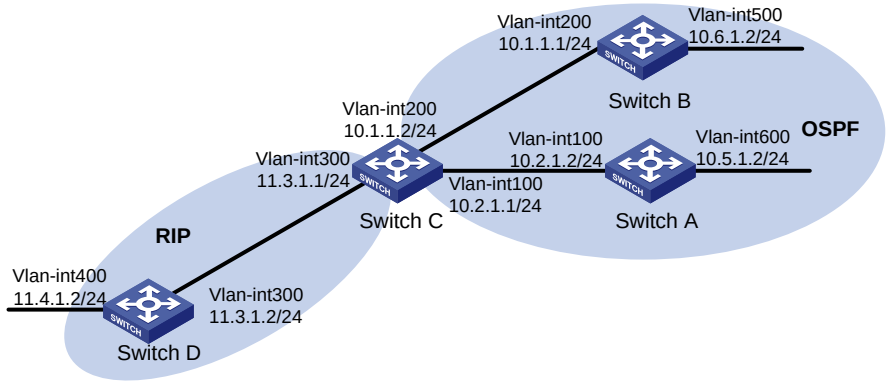
Configure an inbound additional metric of 3 for RIP-enabled interface VLAN-interface 200 on Switch A.

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] rip metricin 3
```

Display all active routes in the RIP database on Switch A.

```
[SwitchA-Vlan-interface200] display rip 1 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, nexthop 1.1.2.1, RIP-interface
       1.1.3.0/24, cost 1, nexthop 1.1.1.2
       1.1.4.0/24, cost 2, nexthop 1.1.1.2
       1.1.5.0/24, cost 2, nexthop 1.1.1.2
```

The output shows that only one RIP route reaches network 1.1.5.0/24, with the next hop as Switch B (1.1.1.2) and a cost of 2.



Example: Configuring RIP to advertise a summary route

Network configuration

As shown in Figure 5, Switch A and Switch B run OSPF, Switch D runs RIP, and Switch C runs OSPF and RIP. Configure RIP to redistribute OSPF routes on Switch C so Switch D can learn routes destined for networks 10.1.1.0/24, 10.2.1.0/24, 10.5.1.0/24, and 10.6.1.0/24.

To reduce the routing table size of Switch D, configure route summarization on Switch C to advertise only the summary route 10.0.0.0/8 to Switch D.

Figure 5 Network diagram

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic OSPF settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ospf
   [SwitchA-ospf-1] area 0
   [SwitchA-ospf-1-area-0.0.0.0] network 10.5.1.0 0.0.0.255
   [SwitchA-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
   [SwitchA-ospf-1-area-0.0.0.0] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ospf
   [SwitchB-ospf-1] area 0
   [SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] network 10.6.1.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ospf
   [SwitchC-ospf-1] area 0
   [SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] quit
   [SwitchC-ospf-1] quit
   ```

3. Configure basic RIP settings:

   # Configure Switch C.

   ```
   [SwitchC] rip 1
   [SwitchC-rip-1] network 11.3.1.0
   [SwitchC-rip-1] version 2
   [SwitchC-rip-1] undo summary
   ```

   # Configure Switch D.

   ```
   <SwitchD> system-view
   [SwitchD] rip 1
   ```

```
[SwitchD-rip-1] network 11.0.0.0
[SwitchD-rip-1] version 2
[SwitchD-rip-1] undo summary
[SwitchD-rip-1] quit
```

Configure RIP to redistribute routes from OSPF process 1 and direct routes on Switch C.

```
[SwitchC-rip-1] import-route direct
[SwitchC-rip-1] import-route ospf 1
[SwitchC-rip-1] quit
```

Display the IP routing table on Switch D.

```
[SwitchD] display ip routing-table

Destinations : 15        Routes : 15

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
0.0.0.0/32          Direct 0    0            127.0.0.1       InLoop0
10.1.1.0/24         RIP    100  1            11.3.1.1        Vlan300
10.2.1.0/24         RIP    100  1            11.3.1.1        Vlan300
10.5.1.0/24         RIP    100  1            11.3.1.1        Vlan300
10.6.1.0/24         RIP    100  1            11.3.1.1        Vlan300
11.3.1.0/24         Direct 0    0            11.3.1.2        Vlan300
11.3.1.0/32         Direct 0    0            11.3.1.2        Vlan300
11.3.1.2/32         Direct 0    0            127.0.0.1       InLoop0
11.4.1.0/24         Direct 0    0            11.4.1.2        Vlan400
11.4.1.0/32         Direct 0    0            11.4.1.2        Vlan400
11.4.1.2/32         Direct 0    0            127.0.0.1       InLoop0
127.0.0.0/8         Direct 0    0            127.0.0.1       InLoop0
127.0.0.0/32        Direct 0    0            127.0.0.1       InLoop0
127.0.0.1/32        Direct 0    0            127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0
```

4. Configure route summarization:

Configure route summarization on Switch C and advertise only the summary route 10.0.0.0/8.

```
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] rip summary-address 10.0.0.0 8
```

Display the IP routing table on Switch D.

```
[SwitchD] display ip routing-table

Destinations : 12        Routes : 12

Destination/Mask    Proto  Pre  Cost         NextHop         Interface

```

Example: Configuring RIP GR

Network configuration

As shown in Figure 6, Switch A, Switch B, and Switch C all run RIPv2.

- Enable GR on Switch A. Switch A acts as the GR restarter.
- Switch B and Switch C act as GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 6 Network diagram

Procedure

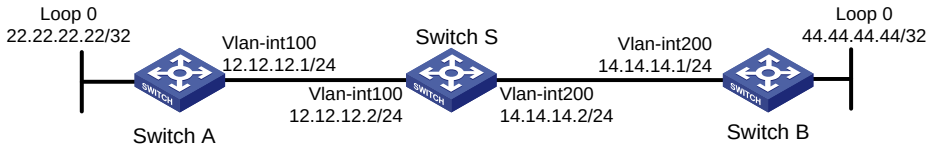
1. Configure IP addresses and subnet masks for the interfaces on the switches. (Details not shown.)
2. Configure RIPv2 on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPv2.
3. Enable RIP GR on Switch A.

```
<SwitchA> system-view
[SwitchA] rip
[SwitchA-rip-1] graceful-restart
```

Verifying the configuration

Restart RIP or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display rip graceful-restart
 RIP process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time : 0   seconds
```



Example: Configuring RIP NSR

Network configuration

As shown in Figure 7, Switch A, Switch B, and Switch S all run RIPv2.

Enable RIP NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 7 Network diagram

Procedure

1. Configure IP addresses and subnet masks for the interfaces on the switches. (Details not shown.)
2. Configure RIPv2 on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch S can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPv2.
3. Enable RIP NSR.

   # Enable RIP NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] rip 100
[SwitchS-rip-100] non-stop-routing
[SwitchS-rip-100] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

```

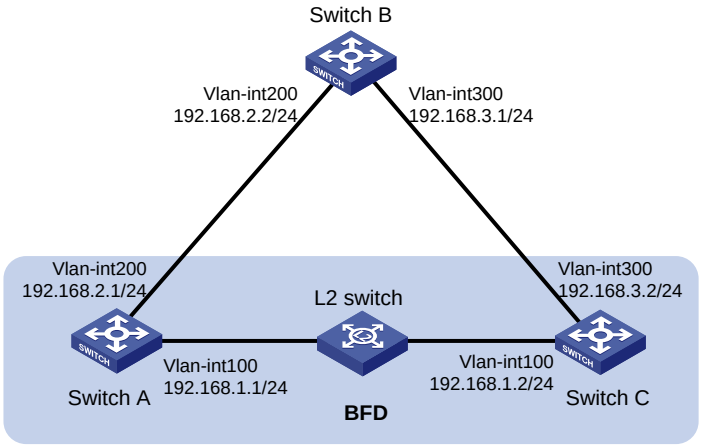
The output shows that the neighbor and route information on Switch A and Switch B keep unchanged during the active/standby switchover on Switch S. The traffic from Switch A to Switch B has not been impacted.

Example: Configuring BFD for RIP (single-hop echo detection for a directly connected neighbor)



Network configuration

As shown in Figure 8, VLAN-interface 100 of Switch A and Switch C runs RIP process 1. VLAN-interface 200 of Switch A runs RIP process 2. VLAN-interface 300 of Switch C and VLAN-interface 200 and VLAN-interface 300 of Switch B run RIP process 1.

- Configure a static route destined for 100.1.1.1/24 and enable static route redistribution into RIP on Switch C. This allows Switch A to learn two routes destined for 100.1.1.1/24 through VLAN-interface 100 and VLAN-interface 200 respectively, and uses the one through VLAN-interface 100.

- Enable BFD for RIP on VLAN-interface 100 of Switch A. When the link over VLAN-interface 100 fails, BFD can quickly detect the failure and notify RIP. RIP deletes the neighbor relationship and route information learned on VLAN-interface 100, and uses the route destined for 100.1.1.1 24 through VLAN-interface 200.

Figure 8 Network diagram

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] version 2
[SwitchA-rip-1] undo summary
[SwitchA-rip-1] network 192.168.1.0
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable
[SwitchA-Vlan-interface100] quit
[SwitchA] rip 2
[SwitchA-rip-2] version 2
[SwitchA-rip-2] undo summary
[SwitchA-rip-2] network 192.168.2.0
[SwitchA-rip-2] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] rip 1
[SwitchB-rip-1] version 2
[SwitchB-rip-1] undo summary
[SwitchB-rip-1] network 192.168.2.0
[SwitchB-rip-1] network 192.168.3.0
[SwitchB-rip-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
```

```
[SwitchC-rip-1] version 2
[SwitchC-rip-1] undo summary
[SwitchC-rip-1] network 192.168.1.0
[SwitchC-rip-1] network 192.168.3.0
[SwitchC-rip-1] import-route static
[SwitchC-rip-1] quit
```

3. Configure BFD parameters on VLAN-interface 100 of Switch A.

```
[SwitchA] bfd echo-source-ip 11.11.11.11
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-echo-receive-interval 500
[SwitchA-Vlan-interface100] bfd detect-multiplier 7
[SwitchA-Vlan-interface100] quit
```

4. Configure a static route on Switch C.

```
[SwitchC] ip route-static 120.1.1.0 24 null 0
```

Verifying the configuration

Display the BFD session information on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv4 session working in echo mode:

 LD               SourceAddr      DestAddr        State  Holdtime    Interface
 4                192.168.1.1     192.168.1.2     Up     2000ms      Vlan100
```

Display RIP routes destined for 120.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
120.1.1.0/24       RIP     100 1           192.168.1.2     Vlan-interface100
```

The output shows that Switch A communicates with Switch C through VLAN-interface 100. Then the link over VLAN-interface 100 fails.

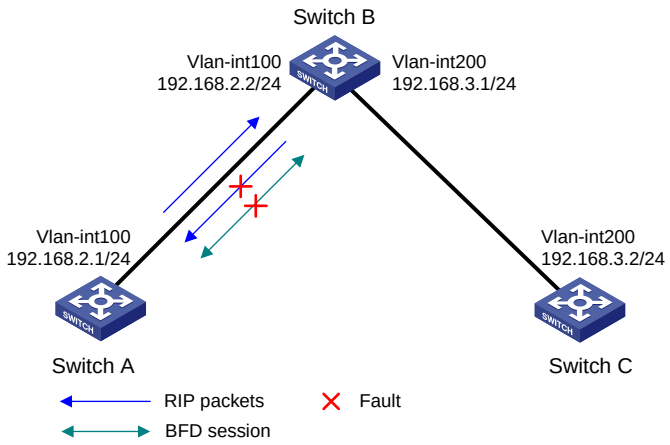
Display RIP routes destined for 120.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
120.1.1.0/24       RIP     100 1           192.168.2.2     Vlan-interface200
```

The output shows that Switch A communicates with Switch C through VLAN-interface 200.



Example: Configuring BFD for RIP (single hop echo detection for a specific destination)

Network configuration

As shown in Figure 9, VLAN-interface 100 of Switch A and Switch B runs RIP process 1. VLAN-interface 200 of Switch B and Switch C runs RIP process 1.

- Configure a static route destined for 100.1.1.0/24 and enable static route redistribution into RIP on both Switch A and Switch C. This allows Switch B to learn two routes destined for 100.1.1.0/24 through VLAN-interface 100 and VLAN-interface 200. The route redistributed from Switch A has a smaller cost than that redistributed from Switch C, so Switch B uses the route through VLAN-interface 200.
- Enable BFD for RIP on VLAN-interface 100 of Switch A, and specify VLAN-interface 100 of Switch B as the destination. When a unidirectional link occurs between Switch A and Switch B, BFD can quickly detect the link failure and notify RIP. Switch B then deletes the neighbor relationship and the route information learned on VLAN-interface 100. It does not receive or send any packets from VLAN-interface 100. When the route learned from Switch A ages out, Switch B uses the route destined for 100.1.1.1 24 through VLAN-interface 200.

Figure 9 Network diagram

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings and enable BFD on the interfaces:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] network 192.168.2.0
[SwitchA-rip-1] import-route static
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable destination 192.168.2.2
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] rip 1
[SwitchB-rip-1] network 192.168.2.0
```

```
[SwitchB-rip-1] network 192.168.3.0
[SwitchB-rip-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
[SwitchC-rip-1] network 192.168.3.0
[SwitchC-rip-1] import-route static cost 3
[SwitchC-rip-1] quit
```

3. Configure BFD parameters on VLAN-interface 100 of Switch A.

```
[SwitchA] bfd echo-source-ip 11.11.11.11
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-echo-receive-interval 500
[SwitchA-Vlan-interface100] return
```

4. Configure static routes:

Configure a static route on Switch A.

```
[SwitchA] ip route-static 100.1.1.0 24 null 0
```

Configure a static route on Switch C.

```
[SwitchA] ip route-static 100.1.1.0 24 null 0
```

Verifying the configuration

Display BFD session information on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv4 session working in echo mode:

 LD               SourceAddr      DestAddr        State  Holdtime    Interface
 3                192.168.2.1     192.168.2.2     Up     2000ms      vlan100
```

Display routes destined for 100.1.1.0/24 on Switch B.

```
<SwitchB> display ip routing-table 100.1.1.0 24 verbose

Summary Count : 1

Example: Configuring BFD for RIP (bidirectional detection in BFD control packet mode)

Network configuration

As shown in Figure 10, VLAN-interface 100 of Switch A and VLAN-interface 200 of Switch C run RIP process 1.

VLAN-interface 300 of Switch A runs RIP process 2. VLAN-interface 400 of Switch C, and VLAN-interface 300 and VLAN-interface 400 of Switch D run RIP process 1.

- Configure a static route destined for 100.1.1.0/24 on Switch A.
- Configure a static route destined for 101.1.1.0/24 on Switch C.

- Enable static route redistribution into RIP on Switch A and Switch C. This allows Switch A to learn two routes destined for 100.1.1.0/24 through VLAN-interface 100 and VLAN-interface 300. It uses the route through VLAN-interface 100.
- Enable BFD on VLAN-interface 100 of Switch A and VLAN-interface 200 of Switch C.

When the link over VLAN-interface 100 fails, BFD can quickly detect the link failure and notify RIP. RIP deletes the neighbor relationship and the route information received learned on VLAN-interface 100. It uses the route destined for 100.1.1.0/24 through VLAN-interface 300.

Figure 10 Network diagram

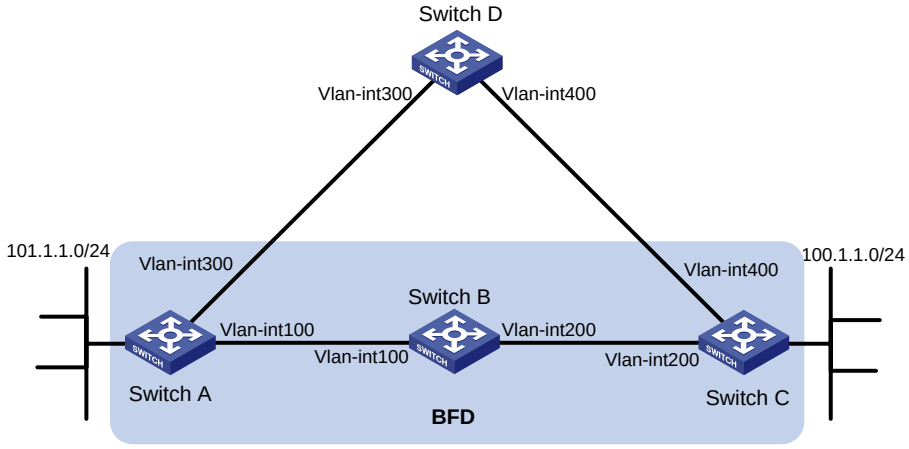

Table 1 Interface and IP address assignment

Device	Interface	IP address
Switch A	VLAN-interface 300	192.168.3.1/24
Switch A	VLAN-interface 100	192.168.1.1/24
Switch B	VLAN-interface 100	192.168.1.2/24
Switch B	VLAN-interface 200	192.168.2.1/24
Switch C	VLAN-interface 200	192.168.2.2/24
Switch C	VLAN-interface 400	192.168.4.2/24
Switch D	VLAN-interface 300	192.168.3.2/24
Switch D	VLAN-interface 400	192.168.4.1/24

Procedure

1. Configure IP addresses for the interfaces. (Details not shown.)
2. Configure basic RIP settings and enable static route redistribution into RIP so Switch A and Switch C have routes to send to each other:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] rip 1
[SwitchA-rip-1] version 2
[SwitchA-rip-1] undo summary
[SwitchA-rip-1] network 192.168.1.0
[SwitchA-rip-1] network 101.1.1.0
[SwitchA-rip-1] peer 192.168.2.2
[SwitchA-rip-1] undo validate-source-address
```

```
[SwitchA-rip-1] import-route static
[SwitchA-rip-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] rip bfd enable
[SwitchA-Vlan-interface100] quit
[SwitchA] rip 2
[SwitchA-rip-2] version 2
[SwitchA-rip-2] undo summary
[SwitchA-rip-2] network 192.168.3.0
[SwitchA-rip-2] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] rip 1
[SwitchC-rip-1] version 2
[SwitchC-rip-1] undo summary
[SwitchC-rip-1] network 192.168.2.0
[SwitchC-rip-1] network 192.168.4.0
[SwitchC-rip-1] network 100.1.1.0
[SwitchC-rip-1] peer 192.168.1.1
[SwitchC-rip-1] undo validate-source-address
[SwitchC-rip-1] import-route static
[SwitchC-rip-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] rip bfd enable
[SwitchC-Vlan-interface200] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] rip 1
[SwitchD-rip-1] version 2
[SwitchD-rip-1] undo summary
[SwitchD-rip-1] network 192.168.3.0
[SwitchD-rip-1] network 192.168.4.0
```

3. Configure BFD parameters:

Configure Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] bfd min-transmit-interval 500
[SwitchA-Vlan-interface100] bfd min-receive-interval 500
[SwitchA-Vlan-interface100] bfd detect-multiplier 7
[SwitchA-Vlan-interface100] quit
```

Configure Switch C.

```
[SwitchC] bfd session init-mode active
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] bfd min-transmit-interval 500
[SwitchC-Vlan-interface200] bfd min-receive-interval 500
[SwitchC-Vlan-interface200] bfd detect-multiplier 7
[SwitchC-Vlan-interface200] quit
```

4. Configure static routes:

Configure a static route to Switch C on Switch A.

```
[SwitchA] ip route-static 192.168.2.0 24 vlan-interface 100 192.168.1.2
```

Configure a static route to Switch A on Switch C.

```
[SwitchC] ip route-static 192.168.1.0 24 vlan-interface 200 192.168.2.1
```

Verifying the configuration

Display the BFD session information on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv4 session working in control packet mode:

 LD/RD            SourceAddr      DestAddr        State  Holdtime    Interface
 513/513          192.168.1.1     192.168.2.2     Up     1700ms      vlan100
```

Display RIP routes destined for 100.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 100.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
100.1.1.0/24       RIP     100 1           192.168.2.2     vlan-interface 100
```

The output shows that Switch A communicates with Switch C through VLAN-interface 100. Then the link over VLAN-interface 100 fails.

Display RIP routes destined for 100.1.1.0/24 on Switch A.

```
<SwitchA> display ip routing-table 100.1.1.0 24

Summary count : 1

Destination/Mask   Proto   Pre Cost        NextHop         Interface
100.1.1.0/24       RIP     100 2           192.168.3.2     vlan-interface 300
```

The output shows that Switch A communicates with Switch C through VLAN-interface 300.

Configuring OSPF

About OSPF

Open Shortest Path First (OSPF) is a link-state IGP developed by the OSPF working group of the IETF. OSPF version 2 is used for IPv4. OSPF refers to OSPFv2 throughout this chapter.

OSPF features

OSPF has the following features:

- **Wide scope**—Supports multiple network sizes and several hundred routers in an OSPF routing domain.
- **Fast convergence**—Advertises routing updates instantly upon network topology changes.
- **Loop free**—Computes routes with the SPF algorithm to avoid routing loops.
- **Area-based network partition**—Splits an AS into multiple areas to facilitate management. This feature reduces the LSDB size on routers to save memory and CPU resources, and reduces route updates transmitted between areas to save bandwidth.
- **Routing hierarchy**—Supports a 4-level routing hierarchy that prioritizes routes into intra-area, inter-area, external Type-1, and external Type-2 routes.
- **Authentication**—Supports area- and interface-based packet authentication to ensure secure packet exchange.
- **Support for multicasting**—Multicasts protocol packets on some types of links to avoid impacting other devices.

OSPF packets

OSPF messages are carried directly over IP. The protocol number is 89.

OSPF uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **Database description (DD)**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **Link state request (LSR)**—Requests needed LSAs from a neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then exchange LSR packets requesting the missing LSAs. LSR packets contain the digest of the missing LSAs.
- **Link state update (LSU)**—Transmits the requested LSAs to the neighbor.
- **Link state acknowledgment (LSAck)**—Acknowledges received LSU packets. It contains the headers of received LSAs (an LSAck packet can acknowledge multiple LSAs).

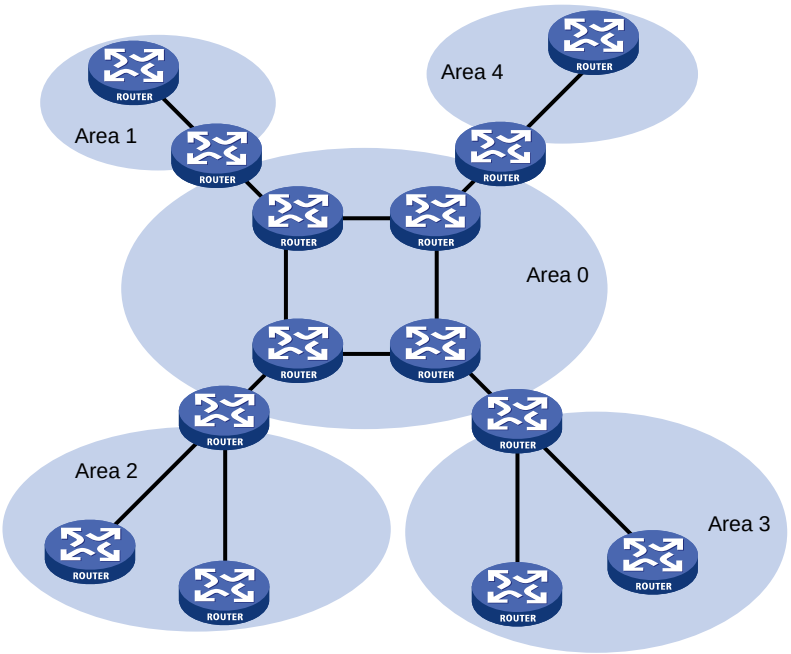
LSA types

OSPF advertises routing information in Link State Advertisements (LSAs). The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers and flooded throughout a single area only. This LSA describes the collected states of the router's interfaces to an area.

- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the designated router, and flooded throughout a single area only. This LSA contains the list of routers connected to the network.
- **Network Summary LSA**—Type-3 LSA, originated by Area Border Routers (ABRs), and flooded throughout the LSA's associated area. Each summary-LSA describes a route to a destination outside the area, yet still inside the AS (an inter-area route).
- **ASBR Summary LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Type 4 summary-LSAs describe routes to Autonomous System Boundary Router (ASBR).
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS (except stub and NSSA areas). Each AS-external-LSA describes a route to another AS.
- **NSSA LSA**—Type-7 LSA, as defined in RFC 1587, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Opaque LSA**—LSA for OSPF extensions. Its format consists of a standard LSA header and application specific information. The opaque LSA includes Type 9, Type 10, and Type 11. The Type 9 opaque LSA is flooded into the local subnet. Grace LSA, used by graceful restart, is Type 9 LSA. The Type 10 is flooded into the local area. LSA used by MPLS TE is Type 10 LSA. The Type 11 is flooded throughout the AS.

OSPF areas



Area-based OSPF network partition

In large OSPF routing domains, SPF route computations consume too many storage and CPU resources, and enormous OSPF packets generated for route synchronization occupy excessive bandwidth.

To resolve these issues, OSPF splits an AS into multiple areas. Each area is identified by an area ID. The boundaries between areas are routers rather than links. A network segment (or a link) can only reside in one area as shown in Figure 1.

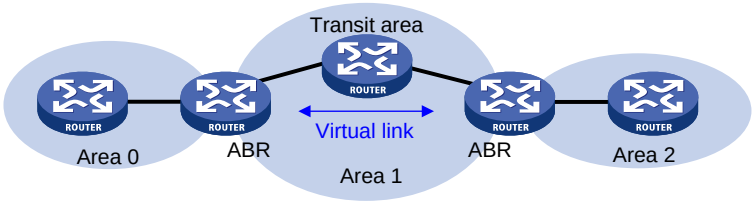
You can configure route summarization on ABRs to reduce the number of LSAs advertised to other areas and minimize the effect of topology changes.

Figure 1 Area-based OSPF network partition

Backbone area

Each AS has a backbone area that distributes routing information between non-backbone areas. Routing information between non-backbone areas must be forwarded by the backbone area. OSPF has the following requirements:

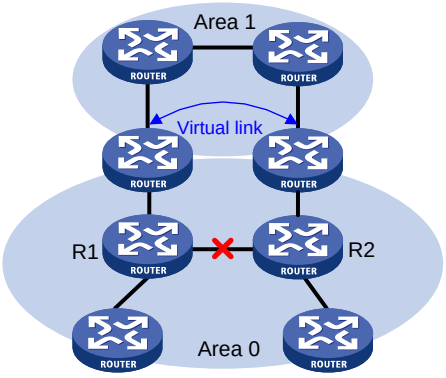
- All non-backbone areas must maintain connectivity to the backbone area.
- The backbone area must maintain connectivity within itself.



In practice, these requirements might not be met due to lack of physical links. OSPF virtual links can solve this issue.

Virtual links

A virtual link is established between two ABRs through a non-backbone area. It must be configured on both ABRs to take effect. The non-backbone area is called a transit area.



As shown in Figure 2, Area 2 has no direct physical link to the backbone Area 0. You can configure a virtual link between the two ABRs to connect Area 2 to the backbone area.

Figure 2 Virtual link application 1

Virtual links can also be used as redundant links. If a physical link failure breaks the internal connectivity of the backbone area, you can configure a virtual link to replace the failed physical link, as shown in Figure 3.

Figure 3 Virtual link application 2

The virtual link between the two ABRs acts as a point-to-point connection. You can configure interface parameters, such as hello interval, on the virtual link as they are configured on a physical interface.

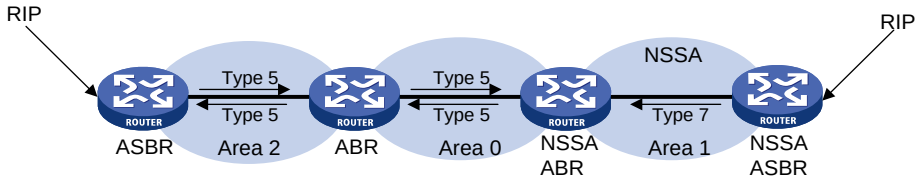
The two ABRs on the virtual link unicast OSPF packets to each other, and the OSPF routers in between convey these OSPF packets as normal IP packets.

Stub area and totally stub area

A stub area does not distribute Type-5 LSAs to reduce the routing table size and LSAs advertised within the area. The ABR of the stub area advertises a default route in a Type-3 LSA so that the routers in the area can reach external networks through the default route.

To further reduce the routing table size and advertised LSAs, you can configure the stub area as a totally stub area. The ABR of a totally stub area does not advertise inter-area routes or external

routes. It advertises a default route in a Type-3 LSA so that the routers in the area can reach external networks through the default route.



NSSA area and totally NSSA area

An NSSA area does not import AS external LSAs (Type-5 LSAs) but can import Type-7 LSAs generated by the NSSA ASBR. The NSSA ABR translates Type-7 LSAs into Type-5 LSAs and advertises the Type-5 LSAs to other areas.

As shown in Figure 4, the OSPF AS contains Area 1, Area 2, and Area 0. The other two ASs run RIP. Area 1 is an NSSA area where the ASBR redistributes RIP routes in Type-7 LSAs into Area 1. Upon receiving the Type-7 LSAs, the NSSA ABR translates them to Type-5 LSAs, and advertises the Type-5 LSAs to Area 0.

The ASBR of Area 2 redistributes RIP routes in Type-5 LSAs into the OSPF routing domain. However, Area 1 does not receive Type-5 LSAs because it is an NSSA area.

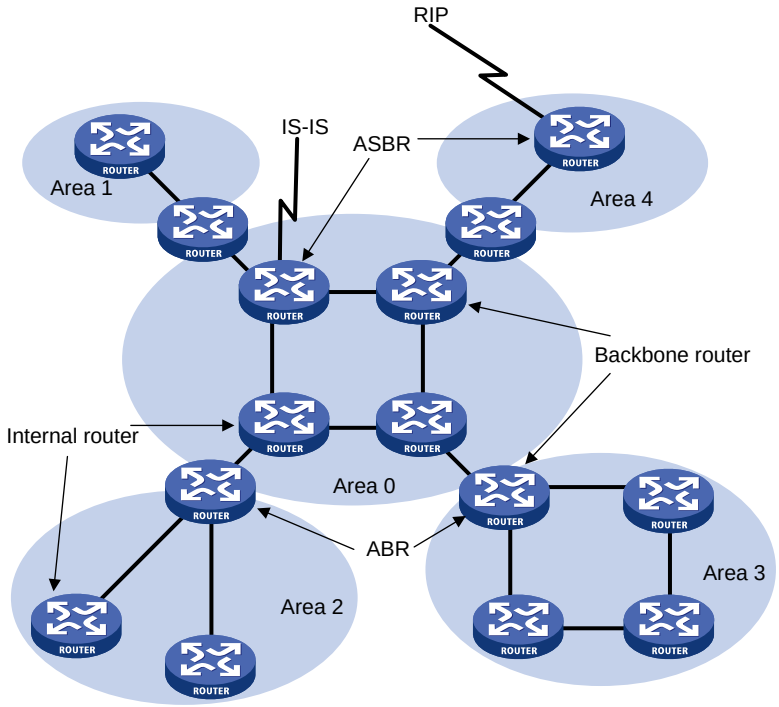


Figure 4 NSSA area

Router types

As shown in Figure 5, OSPF routers are classified into different types, including internal routers, ABRs, backbone routers, and ASBRs.

Figure 5 OSPF router types

Internal router

All interfaces on an internal router belong to one OSPF area.

ABR

An ABR belongs to more than two areas, one of which must be the backbone area. ABR connects the backbone area to a non-backbone area. An ABR and the backbone area can be connected through a physical or logical link.

Backbone router

No less than one interface of a backbone router must reside in the backbone area. All ABRs and internal routers in Area 0 are backbone routers.

ASBR

An ASBR exchanges routing information with another AS. An ASBR might not reside on the border of the AS. It can be an internal router or an ABR.

Route types

OSPF prioritizes routes into the following route levels:

- Intra-area route.
- Inter-area route.
- Type-1 external route.
- Type-2 external route.

The intra-area and inter-area routes describe the network topology of the AS. The external routes describe routes to external ASs.

A Type-1 external route has high credibility. The cost of a Type-1 external route = the cost from the router to the corresponding ASBR + the cost from the ASBR to the destination of the external route.

A Type-2 external route has low credibility. OSPF considers that the cost from the ASBR to the destination of a Type-2 external route is much greater than the cost from the ASBR to an OSPF internal router. The cost of a Type-2 external route = the cost from the ASBR to the destination of the Type-2 external route. If two Type-2 routes to the same destination have the same cost, OSPF takes the cost from the router to the ASBR into consideration to determine the best route.

Router ID

A router ID uniquely identifies a router in an AS. For a router to run OSPF, it must have a router ID. You can choose to manually specify a router ID or use the global router ID for an OSPF process.

Manual configuration

When you create an OSPF process, you can manually specify a router ID. To make sure the router ID is unique in the AS, you can specify the IP address of an interface on the router as the router ID.

Using the global router ID

If you do not specify a router ID when creating an OSPF process, the global router ID is used. As a best practice, manually specify a router ID or enable the OSPF process to automatically obtain a router ID when you create the OSPF process.

Route calculation

OSPF computes routes in an area as follows:

- Each router generates LSAs based on the network topology around itself, and sends them to other routers in update packets.

- Each OSPF router collects LSAs from other routers to compose an LSDB. An LSA describes the network topology around a router, and the LSDB describes the entire network topology of the area.
- Each router transforms the LSDB to a weighted directed graph that shows the topology of the area. All the routers within the area have the same graph.
- Each router uses the SPF algorithm to compute a shortest path tree that shows the routes to the nodes in the area. The router itself is the root of the tree.

OSPF network types

OSPF classifies networks into the following types, depending on different link layer protocols:

- **Broadcast**—If the link layer protocol is Ethernet or FDDI, OSPF considers the network type as broadcast by default. On a broadcast network, hello, LSU, and LSAck packets are multicast to 224.0.0.5 that identifies all OSPF routers or to 224.0.0.6 that identifies the DR and BDR. DD packets and LSR packets are unicast.
- **NBMA**—If the link layer protocol is Frame Relay, ATM, or X.25, OSPF considers the network type as NBMA by default. OSPF packets are unicast on an NBMA network.
- **P2MP**—No link is P2MP type by default. P2MP must be a conversion from other network types such as NBMA. On a P2MP network, OSPF packets are multicast to 224.0.0.5.
- **P2P**—If the link layer protocol is PPP or HDLC, OSPF considers the network type as P2P. On a P2P network, DD packets are unicast and other OSPF packets are multicast to 224.0.0.5.

The following are the differences between NBMA and P2MP networks:

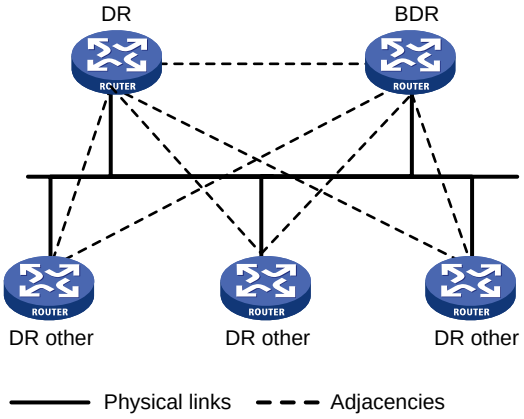
- NBMA networks are fully meshed. P2MP networks are not required to be fully meshed.
- NBMA networks require DR and BDR election. P2MP networks do not have DR or BDR.
- On an NBMA network, OSPF packets are unicast, and neighbors are manually configured. On a P2MP network, OSPF packets are multicast by default, and you can configure OSPF to unicast protocol packets.

DR and BDR

DR and BDR mechanism

On a broadcast or NBMA network, any two routers must establish an adjacency to exchange routing information with each other. If n routers are present on the network, n(n-1)/2 adjacencies are established. Any topology change on the network results in an increase in traffic for route synchronization, which consumes a large amount of system and bandwidth resources.

Using the DR and BDR mechanisms can solve this problem.



- **DR**—Elected to advertise routing information among other routers. If the DR fails, routers on the network must elect another DR and synchronize information with the new DR. Using this mechanism without BDR is time-consuming and is prone to route calculation errors.
- **BDR**—Elected along with the DR to establish adjacencies with all other routers. If the DR fails, the BDR immediately becomes the new DR, and other routers elect a new BDR.

Routers other than the DR and BDR are called DR Others. They do not establish adjacencies with one another, so the number of adjacencies is reduced.

The role of a router is subnet (or interface) specific. It might be a DR on one interface and a BDR or DR Other on another interface.

As shown in Figure 6, solid lines are Ethernet physical links, and dashed lines represent OSPF adjacencies. With the DR and BDR, only seven adjacencies are established.

Figure 6 DR and BDR in a network

NOTE:

In OSPF, neighbor and adjacency are different concepts. After startup, OSPF sends a hello packet on each OSPF interface. A receiving router checks parameters in the packet. If the parameters match its own, the receiving router considers the sending router an OSPF neighbor. Two OSPF neighbors establish an adjacency relationship after they synchronize their LSDBs through exchange of DD packets and LSAs.

DR and BDR election

DR election is performed on broadcast or NBMA networks but not on P2P and P2MP networks.

Routers in a broadcast or NBMA network elect the DR and BDR by router priority and ID. Routers with a router priority value higher than 0 are candidates for DR and BDR election.

The election votes are hello packets. Each router sends the DR elected by itself in a hello packet to all the other routers. If two routers on the network declare themselves as the DR, the router with the higher router priority wins. If router priorities are the same, the router with the higher router ID wins.

If a router with a higher router priority becomes active after DR and BDR election, the router cannot replace the DR or BDR until a new election is performed. Therefore, the DR of a network might not be the router with the highest priority, and the BDR might not be the router with the second highest priority.

OSPF state machines

Interface state machine

On receipt of link state information, OSPF establishes adjacency relationships with neighboring devices, and then exchanges LSAs with them. The state of an OSPF interface indicates the role of the device in an OSPF link. Two neighboring devices can correctly form an adjacency relationship by checking each other's interface state.

The interface state machine involves the following interface states:

- **Down**—Initial interface state.

  An OSPF interface in this state cannot be used for traffic sending or receiving.
- **Loopback**—The network-attached interface is looped back on the device.

  A loopback interface is not available for regular data transmission. However, to obtain link quality information on the interface, you might either send ICMP ping packets to the loopback interface or have a bit error test. To meet this potential requirement, each OSPF device advertises loopback interface information in Router LSAs.
- **Waiting**—The device is determining the DR and BDR for the network.

When the device does not run for the DR or BDR, the interface starts a wait timer. The hello packets sent by the device does not contain any DR or BDR information unless the wait timer expires. The device cannot be elected as the DR or BDR on the network until it exits from **Waiting** state. The wait timer mechanism prevents unnecessary DR and BDR changes.

This interface state is supported only on NBMA networks and broadcast networks.

- **Point-to-point**—The interface is connected to a physical P2P network or to a virtual link.

  If an interface enters this state, it attempts to establish an adjacency relationship with the neighboring device.

  This interface state is supported only on P2P networks and P2MP networks.
- **DR Other**—The interface is connected to a broadcast or NBMA network on which another device has been elected as the DR.

  A device in **DR Other** state is neither elected as the DR nor the BDR. When DR and BDR election is complete on the network, each DR Other device establishes adjacencies with both the DR and the BDR.
- **BDR**—The device is the BDR on the attached network.

  As the BDR, the device establishes adjacencies with all other devices on the attached network. It will immediately become the new DR if the existing DR fails.
- **DR**—The device is the DR on the attached network.

  As the DR, the device establishes adjacencies with all other devices on the attached network.

A number of input events (IE) can cause OSPF interface state changes. As shown in Figure 7, the relationships between IEs and state changes form the OSPF interface state machine.

Figure 7 OSPF interface state machine

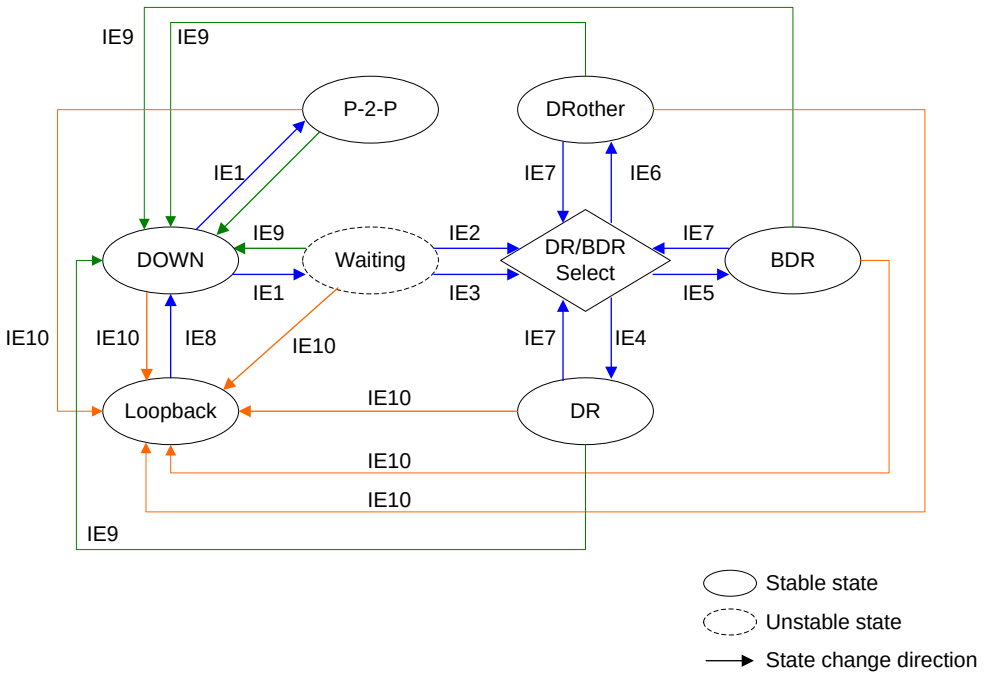


Table 1 shows the IEs that can cause interface state changes.

Table 1 Input events

Input event	Description
IE1	InterfaceUp event: Lower-level protocols have indicated that the interface is operational.

IE2	WaitTimer event: The wait timer has expired and the device can run for the DR or the BDR.
IE3	BackupSeen event: The device has detected the existence or non-existence of a BDR on the attached network through one of the following methods: • The interface receives a hello packet from a neighbor that claims itself to be the BDR. • The interface receives a hello packet from a neighbor that claims itself to be the DR. The hello packet also indicates that there is no BDR. This event marks an end to **Waiting** state and indicates that the device and the neighbor can have bidirectional communication.
IE4	The interface is elected as the DR.
IE5	The interface is elected as the BDR.
IE6	The interface is neither elected as the DR nor the BDR.
IE7	NeighborChange event: A neighbor associated with the interface has a change. The DR and BDR need to be re-elected. The following neighbor changes might lead to the re-election of DR and BDR: • The device can have bidirectional communication with a neighbor. • The device no longer has bidirectional communication with a neighbor. • A neighbor claims itself as DR or BDR. The device detects this event again by examining the hello packets from the neighbor. • A neighbor no longer claims itself as DR or BDR. The device detects this event again by examining the hello packets from the neighbor. • The DR priority for a neighbor has changed. The device detects this event again by examining the hello packets from the neighbor.
IE8	UnloopInd event: Network management or lower-level protocols has indicated that the interface is no longer looped back.
IE9	InterfaceDown event: Lower-level protocols has indicated that the interface is not operational. If this event occurs, the interface state might change to Down.
IE10	LoopInd event: Network management or lower-level protocols has indicated that the interface is looped back. If this event occurs, the interface state might change to Loopback.

Neighbor state machine

The process of OSPF adjacency establishment involves a series of neighbor state changes that transition from **Down** state to **Full** state.

The neighbor state machine involves the following neighbor states:

- **Down**—Initial state of a neighbor conversation.

  This state indicates that the local device does not receive any hello packets from the neighbor within the neighbor dead interval. An OSPF device sends hello packets at intervals of PollInterval.

  Whether an OSPF device sends hello packets to neighbors in **Down** state depends on its network type. The device sends hello packets to neighbors in **Down** state only when its network type is NBMA.

- **Attempt**—In this state, the local device attempts to establish neighbor relationships with the manually specified neighbors by sending hello packets at intervals of HelloInterval.

  This state is valid only for the neighbors on NBMA networks.

- **Init**—This state indicates that the local device has received a hello packet from a neighbor before the neighbor dead interval elapses. However, the local device has not established bidirectional communication with the neighbor, because the received hello packet does not contain the local device's router ID.

- **2-Way**—This state indicates that the local device has established a neighbor relationship with a neighboring device. Each of the two devices has received a hello packet from another and has seen its own router ID in the received hello packet.

  If the neighbor relationship between two devices does not prompt to an adjacency, the neighbor state will remain 2-Way.

  DR and BDR election starts only when the neighbor state is 2-Way or greater.
- **ExStart**—This state indicates that the local device and the neighbor is deciding which is the master. This step is to determine the sequence number for initial DD packets. The devices can then exchange DD packets in order.
- **Exchange**—This state indicates that the local device is exchanging DD packets with the neighbor. The local device describes its LSDB information in DD packets and sends them to the neighbor.
- **Loading**—This state indicates that the local device and the neighbor are having bidirectional LSDB synchronization. They send LSRs to each other to request the most recent LSAs, and then synchronize their LSDBs through exchanges of LSUs and LSAcks.
- **Full**—This state indicates that the local device and the neighbor has completed bidirectional LSDB synchronization and they are fully adjacent.

As shown in Figure 8, the relationships between IEs and state changes form the OSPF neighbor state machine.

Figure 8 OSPF neighbor state machine

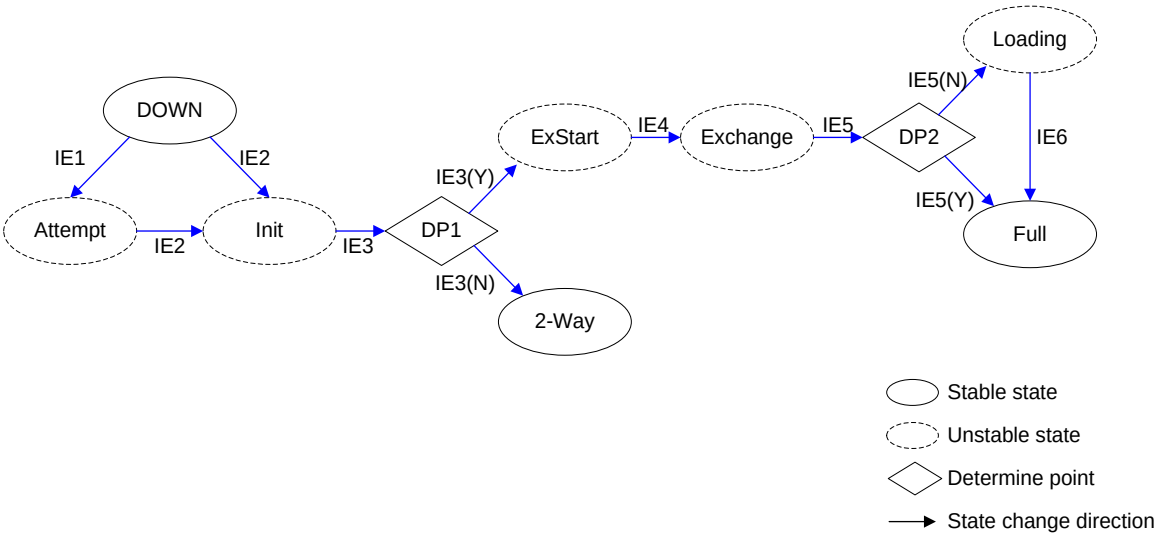

Table 2 shows the IEs that can cause neighbor state changes.

Table 2 Input events

Input event	Description
IE1	Start event: The OSPF device attempts to establish a neighbor relationship with the neighbor by sending hello packets at intervals of HelloInterval. This event is supported only on NBMA networks.
IE2	HelloReceived event: The OSPF device has received a hello packet from the neighbor.
IE3	2-WayReceived event: The OSPF device has received a hello packet from the neighbor and has seen its router ID in the received hello packet. The two neighboring devices have established bidirectional communication. The OSPF device then performs the following task: • If the OSPF device needs to form an adjacency with the neighbor, it changes the neighbor state to ExStart.

	• If the OSPF device should not form an adjacency with the neighbor, it changes the neighbor state to 2-Way.
IE4	NegotiationDone event: The OSPF device and the neighbor have completed master/secondary relationship negotiation and have determined the sequence number for initial DD packets.
IE5	ExchangeDone event: The OSPF device have exchanged DD packets with the neighbor. The OSPF device then performs the following task: • If the LSR list is empty, the device changes the neighbor state to Full. This neighbor state indicates that bidirectional LSDB synchronization is complete and the device has established an adjacency with the neighbor. • If the LSR list is not empty, the device changes the neighbor state to Loading, and then sends LSRs to the neighbor to request missing link state information.
IE6	LoadingDone event: The LSR list is already empty.

Restrictions and guidelines: OSPF configuration

To run OSPF, you must first enable OSPF on the router. Make a proper configuration plan to avoid incorrect settings that can result in route blocking and routing loops.

OSPF tasks at a glance

To configure OSPF, perform the following tasks:

1. Configuring basic OSPF functions
   - Enabling an OSPF process
   - Creating an OSPF area
   - Enabling OSPF
   - (Optional.) Enabling OSPF to establish neighbor relationships through the secondary IP addresses of an interface
2. (Optional.) Configuring OSPF stub and NSSA areas
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring a virtual link
3. (Optional.) Configuring OSPF network types
   - Configuring the broadcast network type for an interface
   - Configuring the NBMA network type for an interface
   - Configuring the P2MP network type for an interface
   - Configuring the P2P network type for an interface
4. (Optional.) Configuring OSPF route control
   - Configuring OSPF inter-area route summarization
   - Configuring redistributed route summarization
   - Configuring received OSPF route filtering
   - Configuring Type-3 LSA filtering
   - Setting an OSPF cost for an interface
   - Enabling OSPF to advertise the maximum link cost to neighbors
   - Associating OSPF with Track
   - Setting OSPF preference
   - Configuring discard routes for summary networks
   - Redistributing routes from another routing protocol
   - Redistributing a default route
   - Advertising a host route
5. (Optional.) Setting OSPF timers
   - Configuring OSPF packet timers
   - Setting the LSA transmission delay
   - Setting the OSPF route calculation interval
   - Setting the minimum LSA arrival interval
   - Setting the LSA update interval
   - Setting the OSPF exit overflow interval
6. (Optional.) Configuring OSPF packet parameters

- Disabling interfaces from receiving and sending OSPF packets
- Adding the interface MTU into DD packets
- Setting the DSCP value for outgoing OSPF packets
- Setting the maximum length of OSPF packets that can be sent by an interface
- Setting the LSU transmit rate

7. (Optional.) Controlling LSA generation, advertisement, and reception
   - Setting the maximum number of external LSAs in LSDB
   - Filtering outbound LSAs on an interface
   - Filtering LSAs for the specified neighbor
8. (Optional.) Accelerating OSPF convergence speed
   - Enabling OSPF ISPF
   - Configuring prefix suppression
   - Configuring prefix prioritization
   - Configuring OSPF PIC
9. (Optional.) Configuring advanced OSPF features
   - Configuring stub routers
   - Configuring OSPF isolation
   - Configuring OSPF shutdown
   - Enabling compatibility with RFC 1583
10. (Optional.) Enhancing OSPF availability
    - Configuring OSPF GR
    - Configuring OSPF NSR
    - Configuring BFD for OSPF
11. (Optional.) Configuring OSPF security features
    - Configuring OSPF authentication
    - Configuring GTSM for OSPF
12. (Optional.) Configuring OSPF logging, SNMP notifications, and troubleshooting
    - Logging neighbor state changes
    - Configuring the OSPF logging feature
    - Configuring OSPF network management
    - Setting the maximum number of OSPF neighbor relationship troubleshooting entries

Configuring basic OSPF functions

Enabling an OSPF process

1. Enter system view.

   system-view

2. (Optional.) Configure a global router ID.

   router id *router-id*

   By default, no global router ID is configured.

   If no global router ID is configured, the highest loopback interface IP address, if any, is used as the router ID. If no loopback interface IP address is available, the highest physical interface IP address is used, regardless of the interface status (up or down).

3. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.

   description *text*

   By default, no description is configured for the OSPF process.

   As a best practice, configure a description for each OSPF process.

Creating an OSPF area

1. Enter system view.

   system-view
2. (Optional.) Configure a global router ID.

   router id *router-id*

   By default, no global router ID is configured.
3. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.

   description *text*

   By default, no description is configured for the OSPF process.

   As a best practice, configure a description for each OSPF process.
5. Create an OSPF area and enter OSPF area view.

   area *area-id*
6. (Optional.) Configure a description for the area.

   description *text*

   By default, no description is configured for the area.

   As a best practice, configure a description for each OSPF area.

   This configuration is available only in OSPF area view.
7. (Optional.) Exclude interfaces in the OSPF area from the base topology:

   capability default-exclusion

   By default, interfaces in an OSPF area belong to the base topology.

   For correct neighbor relationship establishment, perform this task on both the local device and the neighbor device.

   This command is available only in OSPF area view.

Enabling OSPF

About this task

To enable OSPF on a router, you must perform the following tasks:

1. Create an OSPF process.
2. Create an OSPF area for the process.
3. Specify a network in the area.

The interface attached to the network will run the OSPF process in the area. OSPF advertises direct routes of the interface.

OSPF supports multiple processes. To run multiple OSPF processes, you must specify an ID for each process. The process IDs take effect locally and has no influence on packet exchange between routers. Two routers with different process IDs can exchange packets.

Restrictions and guidelines for enabling OSPF

When you configure OSPF on an interface, follow these restrictions and guidelines:

- You can enable OSPF on the network where the interface resides or directly enable OSPF on that interface. If you configure both, the latter takes precedence.
- If the specified OSPF process and area do not exist, the operation creates an OSPF process and area for the interface. Disabling an OSPF process on an interface does not delete the OSPF process or the area.

Enabling OSPF on a network

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPF area view.
   area *area-id*
4. Specify a network to enable the interface attached to the network to run the OSPF process in the area.
   network *ip-address wildcard-mask*

   By default, no network is specified to enable OSPF on the interface attached to the network.

   A network can be added to only one area.

Enabling OSPF on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable an OSPF process on the interface.
   ospf *process-id* **area** *area-id* [**exclude-subip**]

   By default, OSPF is disabled on an interface.

Enabling OSPF to establish neighbor relationships through the secondary IP addresses of an interface

About this task

By default, OSPF uses only the primary IP address of an interface to establish neighbor relationships. This feature enables OSPF to establish neighbor relationships through the secondary IP addresses of an interface.

Restrictions and guidelines

- For an interface with both primary and secondary addresses, if you have advertised only the primary address in an area of an OSPF process, OSPF uses only the primary address to establish neighbor relationships. For OSPF to establish neighbor relationships through the

secondary IP addresses, you must also advertise the secondary IP addresses in the same area of the same OSPF process.

- If an interface does not have a primary address but has multiple secondary addresses, OSPF uses the lowest secondary address to establish neighbor relationships. For OSPF to establish neighbor relationships through the other secondary addresses, you must advertise these addresses in the same area of the same OSPF process.
- After you execute the **ospf peer sub-address enable** command on a P2P OSPF interface, the device automatically checks the local and remote interface IP addresses before neighbor establishment. If the IP addresses belong to different networks, they cannot establish a neighbor relationship.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable OSPF to establish neighbor relationships through the secondary IP addresses of the interface.

   ospf peer sub-address enable

   By default, OSPF cannot establish neighbor relationships through the secondary IP addresses of an interface.

Configuring OSPF stub and NSSA areas

About OSPF stub and NSSA area configuration

This task allows you to configure an OSPF area as a stub area or NSSA area. It also allows you to create a virtual link if no connectivity can be achieved between a non-backbone area and backbone area, or in the backbone area.

Configuring a stub area

About this task

You can configure a non-backbone area at an AS edge as a stub area. To do so, execute the **stub** command on all routers attached to the area. The routing table size is reduced because Type-5 LSAs will not be flooded within the stub area. The ABR generates a default route into the stub area so all packets destined outside of the AS are sent through the default route.

To further reduce the routing table size and routing information exchanged in the stub area, configure a totally stub area by using the **stub no-summary** command on the ABR. AS external routes and inter-area routes will not be distributed into the area. All the packets destined for outside of the AS or area will be sent to the ABR for forwarding.

A stub or totally stub area cannot have an ASBR because external routes cannot be distributed into the area.

Restrictions and guidelines

Do not configure the backbone area as a stub area or totally stub area.

To configure an area as a stub area, execute the **stub** command on all routers attached to the area.

To configure an area as a totally stub area, execute the **stub** command on all routers attached to the area, and execute the **stub no-summary** command on the ABR.

Procedure (OSPF area view)

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no stub area is configured.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.
   This command takes effect only on the ABR of a stub area or totally stub area.

Configuring an NSSA area

About this task

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPF routing domain while retaining other stub area characteristics.

To configure an area as a totally NSSA area, use the **nssa no-summary** command. The ABR of the area does not advertise inter-area routes into the area.

Restrictions and guidelines

Do not configure the backbone area as an NSSA area or totally NSSA area.

To configure an NSSA area, configure the **nssa** command on all the routers attached to the area.

To configure a totally NSSA area, configure the **nssa** command on all the routers attached to the area and configure the **nssa no-summary** command on the ABR.

Procedure (OSPF area view)

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.
   area *area-id*
4. Configure the area as an NSSA area.
   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **type** *type*] * | **no-import-route** | **no-summary** | **suppress-fa** | [[[**translate-always**] [**translate-ignore-checking-backbone**]] | **translate-never**] | **translator-stability-interval** *value*] *
   By default, no area is configured as an NSSA area.
5. (Optional.) Set a cost for the default route advertised to the NSSA area.

default-cost *cost-value*

By default, the cost for the default route advertised to the NSSA area is 1.

This command takes effect only on the ABR/ASBR on an NSSA area or totally NSSA area.

Configuring a virtual link

About this task

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

A virtual link cannot traverse a stub area, totally stub area, NSSA area, or totally NSSA area.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure a virtual link.

   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | { **authentication-none** | { **hmac-md5** | **hmac-sha-256** | **md5** } [*key-id* { **cipher** | **plain** } *string*] | **keychain** *keychain-name* | **simple** [{ **cipher** | **plain** } *string*] } | **retransmit** *seconds* | **trans-delay** *seconds*] *

   Configure this command on both ends of a virtual link. The **hello** and **dead** intervals must be identical on both ends of the virtual link.

Configuring OSPF network types

Based on the link layer protocol, OSPF classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

Restrictions and guidelines for configuring OSPF network types

If any routers in a broadcast network do not support multicasting, change the network type to NBMA.

If only two routers running OSPF exist on a network segment, you can change the network type to P2P to save costs.

Two broadcast-, NBMA-, and P2MP-interfaces can establish a neighbor relationship only when they are on the same network segment.

Configuring the broadcast network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as broadcast.

   ospf network-type broadcast

   By default, the network type of an interface depends on the encapsulated link layer protocol.

4. (Optional.) Set a router priority for the interface.

   ospf dr-priority *priority*

   The default router priority is 1.

Configuring the NBMA network type for an interface

Restrictions and guidelines

After you configure the network type as NBMA, you must specify neighbors and their router priorities because NBMA interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as NBMA.

   ospf network-type nbma

   By default, the network type of an interface depends on the encapsulated link layer protocol.

4. (Optional.) Set a router priority for the interface.

   ospf dr-priority *priority*

   The default router priority for an interface is 1.

   The router priority configured with this command is for DR election.

5. Return to system view.

   quit

6. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

7. Specify an NBMA neighbor.

   peer *ip-address* [**dr-priority** *priority*]

   By default, no neighbor is specified.

   The priority configured with this command indicates whether a neighbor has the election right or not. If you configure the router priority for a neighbor as 0, the local router determines the neighbor has no election right. It does not send hello packets to this neighbor. However, if the local router is the DR or BDR, it still sends hello packets to the neighbor for neighbor relationship establishment.

Configuring the P2MP network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as P2MP.

   ospf network-type p2mp [**unicast**]

   By default, the network type of an interface depends on the encapsulated link layer protocol.

   After you configure the OSPF network type for an interface as P2MP unicast, all packets are unicast over the interface. The interface cannot broadcast hello packets to discover neighbors, so you must manually specify the neighbors.

4. Return to system view.

   quit

5. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

6. Specify a P2MP neighbor.

   peer *ip-address* [**cost** *cost-value*]

   By default, no neighbor is specified

   This step is required if the interface network type is P2MP unicast.

Configuring the P2P network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as P2P.

   ospf network-type p2p [**multicast** | **peer-address-check**] *

   By default, the network type of an interface depends on the encapsulated link layer protocol.

Configuring OSPF route control

This section describes how to control the advertisement and reception of OSPF routing information, as well as route redistribution from other protocols.

Configuring OSPF inter-area route summarization

About this task

OSPF inter-area route summarization reduces the routing information exchanged between areas and the size of routing tables, and improves routing performance.

OSPF inter-area route summarization enables an ABR to summarize contiguous networks into a single network and advertise the network to other areas. For example, three internal networks 19.1.1.0/24, 19.1.2.0/24, and 19.1.3.0/24 are available within an area. You can configure the ABR to summarize the three networks into network 19.1.0.0/16, and advertise the summary network to other areas in a Type-3 LSA. This configuration reduces the scale of LSDBs on routers in other areas and the influence of topology changes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure ABR route summarization.

   abr-summary *ip-address* { *mask-length* | *mask* } [**advertise** | **not-advertise**] [**cost** *cost-value*]

   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About this task

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route. The ASBR advertises only Type-5 LSAs to reduce the number of LSAs in the LSDB.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.

Restrictions and guidelines

If an ASBR (also an ABR) is a translator in an NSSA area, it summarizes routes in Type-5 LSAs translated from Type-7 LSAs. If it is not a translator, it does not summarize routes in in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure ASBR route summarization.

   asbr-summary *ip-address* { *mask-length* | *mask* } [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

   By default, route summarization is not configured on an ASBR.

Configuring received OSPF route filtering

About this task

Perform this task to filter routes calculated using received LSAs.

The following filtering methods are available:

- Use an ACL or IP prefix list to filter routing information by destination address.
- Use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use an ACL or IP prefix list to filter routing information by destination address. At the same time use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use the **route-policy** *route-policy-name* option to filter routing information.

Procedure

1. Enter system view.

system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure OSPF to filter routes calculated using received LSAs.

   filter-policy { *ipv4-acl-number* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-policy** *route-policy-name* } **import**

   By default, OSPF accepts all routes calculated by using received LSAs.

Configuring Type-3 LSA filtering

About this task

Perform this task to filter Type-3 LSAs advertised into the local area or other areas on an ABR.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure Type-3 LSA filtering.

   filter { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

   By default, the ABR does not filter Type-3 LSAs.

Setting an OSPF cost for an interface

About this task

Set an OSPF cost for an interface by using either of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface. OSPF computes the cost with this formula: Interface OSPF cost = Bandwidth reference value (100 Mbps) / Expected interface bandwidth (Mbps). The expected bandwidth of an interface is configured with the **bandwidth** command (see *Interface Command Reference*).
  - If the calculated cost is greater than 65535, the value of 65535 is used. If the calculated cost is less than 1, the value of 1 is used.
  - If no cost or bandwidth reference value is configured for an interface, OSPF computes the interface cost based on the interface bandwidth and default bandwidth reference value.

Setting an OSPF cost for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set an OSPF cost for the interface.

ospf cost *cost-value*

By default, the OSPF cost is calculated according to the interface bandwidth. For a loopback interface, the OSPF cost is 0 by default.

Setting a bandwidth reference value

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set a bandwidth reference value.

   bandwidth-reference *value*

   The default setting is 100 Mbps.

Enabling OSPF to advertise the maximum link cost to neighbors

About this task

On an OSPF network, when a link recovers from failures or the state of an interface changes, OSPF will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable OSPF to advertise the maximum link cost to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, OSPF advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable OSPF to advertise the maximum link cost to neighbors within the specified period.

   ospf peer hold-max-cost duration *time*

   By default, OSPF advertises the original link cost to neighbors during a route convergence.

Associating OSPF with Track

About this task

Perform this task to associate an OSPF interface with a track entry to adjust the cost of the interface as follows:

- When the track entry state becomes negative, OSPF increases the cost of the interface.
- When the track entry state becomes positive, OSPF restores the cost of the interface to the original value.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Associate the OSPF interface with a track entry to adjust the cost of the interface based on the track entry state.

   ospf track *track-entry-number* **adjust-cost** { *cost-offset* | **max** }

   By default, an OSPF interface is not associated with any track entry.

Setting OSPF preference

About this task

A router can run multiple routing protocols, and each protocol is assigned a preference. If multiple routes are available to the same destination, the one with the highest protocol preference is selected as the best route.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set a preference for OSPF.

   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPF internal routes is 10 and the preference of OSPF external routes is 150.

Configuring discard routes for summary networks

About this task

Perform this task on an ABR or ASBR to specify whether to generate discard routes for summary networks. You can also specify a preference for the discard routes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure discard routes for summary networks.

   discard-route { **external** { *preference* | **suppression** } | **internal** { *preference* | **suppression** } } *

   By default, the ABR or ASBR generates discard routes for summary networks and the default preference of discard routes is 255.

Redistributing routes from another routing protocol

About this task

When an OSPF device does not have routes from a non-OSPF routing protocol, it cannot access any devices that run the non-OSPF routing protocol. To resolve this issue, you can configure OSPF to

redistribute routes from other protocols, such as IS-IS. OSPF can then advertise the routes in Type-5 LSAs or Type-7 LSAs.

In addition, you can configure OSPF to filter redistributed routes so that OSPF advertises only permitted routes.

Restrictions and guidelines

Although OSPF is a dynamic routing protocol that provides loop-free intra-area/inter-area routes, this protocol is not good at guarding against the routing loops caused by redistributed external routes. When you configure route redistribution for OSPF, make sure you have understood the potential impact.

OSPF redistributes only active routes. To view route status information, use the **display ip routing-table protocol** command.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure route redistribution.

   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **isis** | **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, OSPF does not redistribute routes.

4. (Optional.) Configure OSPF to filter redistributed routes.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

   By default, OSPF accepts all redistributed routes.

5. Configure the default parameters for redistributed routes (cost, tag, and type).

   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *

   By default, the cost is 1, the tag is 1, and the route type is 2

Redistributing a default route

About this task

On a OSPF network, multiple ABRs and ASBRs work together to implement multi-egress redundancy or load balancing. To ease the service burden on these devices and save routing table capacity, you can configure default routes.

OSPF default routes are mostly used in the following scenarios:

- After receiving a Type 3 LSA that describes a default route from the ABR, the intra-area router can use the route for packet forwarding to another area in the same AS.
- After receiving a Type 5 or 7 LSA that describes a default route from the ASBR, the intra-area router can use the route for packet forwarding to another AS.

When a router cannot find a exactly matching route, it can use the default route for packet forwarding. The default route originated from a Type 3 LSA takes precedence over that originated from a Type 5 LSA.

As shown in Table 3, the advertisement method for a redistributed default route varies by its area type.

Table 3 Advertisement of redistributed default routes

Area type	Route redistribution condition	Advertiser	LSA type	LSA flooding scope
Common area	Use the **default-route-advertise** command.	ASBR	Type 5 LSA	Common area
Stub area	Automatic route redistribution.	ABR	Type 3 LSA	Stub area
NSSA area	Use the **nssa** [**default-route-advertise**] command.	ASBR	Type 7 LSA	NSSA area
Totally NSSA area	Automatic route redistribution.	ABR	Type 3 LSA	NSSA area

The **import-route** command cannot redistribute a default route from an external routing protocol. To resolve this issue, perform this task on the ASBR to redistribute a default route.

Restrictions and guidelines

After receiving a default route from the ASBR, the device can add the default route to its routing table in one of the following scenarios:

- The device does not have a static route.
- The device has a static route, but the priority value for the default route is higher than that for the static route.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Redistribute a default route.
   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *
   default-route-advertise [**summary cost** *cost-value*]
   By default, no default route is redistributed.
   This command is applicable only to VPNs. The PE router advertises a default route in a Type-3 LSA to a CE router.
4. Configure the default parameters for redistributed routes (cost, tag, and type).
   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *
   By default, the cost is 1, the tag is 1, and the route type is 2.

Advertising a host route

1. Enter system view.
   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter area view.

   area *area-id*

4. Advertise a host route.

   host-advertise *ip-address cost-value*

   By default, OSPF does not advertise host routes that are not in the area.

Setting OSPF timers

About setting OSPF timers

This task allows you to change OSPF packet timers to adjust the convergence speed and network load and tune the delay time for sending LSAs on low-speed links.

Configuring OSPF packet timers

About this task

An OSPF interface includes the following timers:

- **Hello timer**—Interval for sending hello packets. It must be identical on OSPF neighbors.
- **Poll timer**—Interval for sending hello packets to a neighbor that is down on the NBMA network.
- **Dead timer**—Interval within which if the interface does not receive any hello packet from the neighbor, it declares the neighbor is down.
- **LSA retransmission timer**—Interval within which if the interface does not receive any acknowledgment packets after sending an LSA to the neighbor, it retransmits the LSA.

Restrictions and guidelines

The default value for the hello interval and neighbor dead interval depends on the network type. When the network type for an interface is changed, the default hello interval and neighbor dead interval are restored. Make sure two neighboring interfaces are configured with the same hello interval and neighbor dead interval. Inconsistent settings will affect the OSPF neighbor relationship establishment.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospf timer hello *seconds*

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the poll interval.

   ospf timer poll *seconds*

   The default setting is 120 seconds.

   The poll interval is a minimum of four times the hello interval.

5. Set the dead interval.

   ospf timer dead *seconds*

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

   The dead interval must be a minimum of four times the hello interval on an interface.

6. Set the retransmission interval.

   ospf timer retransmit *interval*

   The default retransmission interval is 5 seconds.

   A retransmission interval setting that is too small can cause unnecessary LSA retransmissions. Typically set a bigger interval than the round-trip time of a packet between two neighbors.

Setting the LSA transmission delay

About this task

To avoid LSAs from aging out during transmission, set an LSA retransmission delay especially for low speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospf trans-delay *seconds*

   The default LSA transmission delay is 1 second.

Setting the OSPF route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.
- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for subsequent route calculations is *maximum-interval*.

- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPF.

   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the minimum LSA arrival interval

About this task

OSPF drops any duplicate LSAs (with the same LSA type, LS ID, and router ID) within the minimum LSA arrival interval. This helps avoid overuse of bandwidth and router resources due to frequent network changes.

Restrictions and guidelines

On a stable network, you can set the LSA arrival interval to 0 to fasten route convergence.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the minimum LSA arrival interval.

   lsa-arrival-interval *interval*

   By default, the minimum LSA arrival interval is 1000 milliseconds.

Setting the LSA update interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA update interval settings for OSPF.

The default LSA update interval settings are as follows:

- The interval for the first LSA update is 50 milliseconds.
- The interval for the nth (n ≥ 2) LSA update is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The LSA update interval is fixed at *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA update is *minimum-interval*.
  - The interval for subsequent LSA updates is *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA update is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA update is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the LSA update interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the OSPF exit overflow interval

About this task

When the number of LSAs in the LSDB exceeds the upper limit, the LSDB is in an overflow state. In this state, OSPF does not receive any external LSAs and deletes the external LSAs generated by itself to save system resources.

This task allows you to configure the interval that OSPF exits overflow state.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the interval that OSPF exits overflow state.

   lsdb-overflow-interval *interval*

   By default, the OSPF exit overflow interval is 300 seconds. An interval of 0 means that OSPF does not exit overflow state.

Configuring OSPF packet parameters

Disabling interfaces from receiving and sending OSPF packets

About this task

To enhance OSPF adaptability and reduce resource consumption, you can set an OSPF interface to "silent." A silent OSPF interface blocks OSPF packets and cannot establish any OSPF neighbor relationship. However, other interfaces on the router can still advertise direct routes of the interface in Router LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Disable interfaces from receiving and sending OSPF packets.

   silent-interface { *interface-type interface-number* | **all** }

   By default, an OSPF interface can receive and send OSPF packets.

   This command disables only the interfaces associated with the current process rather than other processes. Multiple OSPF processes can disable the same interface from receiving and sending OSPF packets.

Adding the interface MTU into DD packets

About this task

By default, an OSPF interface adds a value of 0 into the interface MTU field of a DD packet rather than the actual interface MTU. On receipt of a DD packet, the interface does not check the interface MTU field of that packet. Such a mechanism ensures that two interfaces in different devices can establish a neighbor relationship regardless of the interface MTU. However, the device cannot establish neighbor relationships with the devices from another manufacturer that discard the DD packets whose interface MTU value is 0.

To resolve this issue, perform this task to enable an OSPF interface to add its interface MTU into DD packets and check the interface MTU in received DD packets. If the interface MTU in a received DD packet is higher than the MTU of the local interface, the interface will discard the DD packet. To ensure that two interfaces in different devices can establish a neighbor relationship, set the same MTU for these interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to add its MTU into DD packets.

   ospf mtu-enable

   By default, the interface adds an MTU value of 0 into DD packets.

Setting the DSCP value for outgoing OSPF packets

About this task

The DSCP value specifies the precedence of outgoing packets.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the DSCP value for outgoing OSPF packets.
   dscp *dscp-value*
   By default, the DSCP value for outgoing OSPF packets is 48.

Setting the maximum length of OSPF packets that can be sent by an interface

About this task

This task allows you to limit the length of OSPF packets sent over an interface.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum length of OSPF packets that can be sent by an interface.
   ospf packet-size *value*
   By default, the maximum length of OSPF packets that an interface can send equals the interface's MTU.

Setting the LSU transmit rate

About this task

During LSDB synchronization, if the local router has multiple neighbors, it must send many LSUs to each neighbor. When a neighbor receives excessive LSUs within a short time period, the following events might occur:

- The neighbor experiences degraded performance because it uses too many system resources to process the received LSU packets.
- The neighbor drops hello packets used for maintaining the neighbor relationship because it is busy dealing with the LSUs. As a result, the neighbor relationship is torn down. To reestablish a relationship to the neighbor, the local router must send more LSUs to the neighbor. This exacerbates the performance degradation.

This task allows you to limit the LSU transmit rate by setting the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.

Procedure

1. Enter system view.
   system-view
2. Enable OSPF to limit the LSU transmit rate.
   ospf lsu-flood-control [*interval count*]
   By default, OSPF does not limit the LSU transmit rate.
   Inappropriate use of this command might cause abnormal routing. As a best practice, execute this command with the default values.
3. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
4. (Optional.) Set the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.
   transmit-pacing interval *interval* **count** *count*
   By default, an OSPF interface sends a maximum of three LSU packets every 20 milliseconds.

Controlling LSA generation, advertisement, and reception

Setting the maximum number of external LSAs in LSDB

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of external LSAs in the LSDB.
   lsdb-overflow-limit *number*
   By default, the maximum number of external LSAs in the LSDB is not limited.

Filtering outbound LSAs on an interface

About this task

To reduce the LSDB size for the neighbor and save bandwidth, you can perform this task on an interface to filter LSAs to be sent to the neighbor.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Filter outbound LSAs on the interface.
   ospf database-filter { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }
   By default, the outbound LSAs are not filtered on the interface.

Filtering LSAs for the specified neighbor

About this task

On a P2MP network, a router might have multiple P2MP type OSPF neighbors. Perform this task to prevent the router from sending LSAs to the specified P2MP neighbor.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Filter LSAs for the specified P2MP neighbor.

   database-filter peer *ip-address* { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }

   By default, the LSAs for the specified P2MP neighbor are not filtered.

Accelerating OSPF convergence speed

Enabling OSPF ISPF

About this task

When the topology changes, Incremental Shortest Path First (ISPF) computes only the affected part of the SPT, instead of the entire SPT.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPF ISPF.

   ispf enable

   By default, OSPF ISPF is enabled.

Configuring prefix suppression

About this task

By default, an OSPF interface advertises all of its prefixes in LSAs. To speed up OSPF convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- On P2P and P2MP networks, OSPF does not advertise Type-3 links in Type-1 LSAs. Other routing information can still be advertised to ensure traffic forwarding.
- On broadcast and NBMA networks, the DR generates Type-2 LSAs with a mask length of 32 to suppress network routes. Other routing information can still be advertised to ensure traffic forwarding. If no neighbors exist, the DR does not advertise Type-3 links in Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPF routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPF process

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable prefix suppression for the OSPF process.

   prefix-suppression

   By default, prefix suppression is disabled for an OSPF process.

   This feature does not suppress the prefixes of secondary IP addresses, loopback interfaces, and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable prefix suppression for the interface.

   ospf prefix-suppression [**disable**]

   By default, prefix suppression is disabled on an interface.

   This feature does not suppress prefixes of secondary IP addresses.

Configuring prefix prioritization

About this task

OSPF calculates intra-area routes, inter-area routes, and AS external routes in descending convergence priority order: critical, high, medium, and low. When a route matches multiple prefix priorities, it prefers to use the highest priority.

To prioritize the convergence of specific routes, perform this task to set a higher convergence priority value for those routes.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

3. Configure a routing policy.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

4. Use the IPv4 prefix list as an IPv4 route filter.

   if-match ip { **address** | **next-hop** | **route-source** } **prefix-list** *prefix-list-name*

   By default, no IPv4 route filters are configured.

5. Set a prefix priority for matching routes.
   apply prefix-priority { **critical** | **high** | **medium** }
   By default, no prefix priority is set.
6. Return to system view.
   quit
7. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
8. Enable prefix prioritization.
   prefix-priority route-policy *route-policy-name*
   By default, prefix prioritization is disabled.

Configuring OSPF PIC

About this task

Prefix Independent Convergence (PIC) enables the device to speed up network convergence by ignoring the number of prefixes.

Restrictions and guidelines for OSPF PIC

OSPF PIC applies only to inter-area routes and external routes.

Enabling OSPF PIC

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable PIC for OSPF.
   pic [**additional-path-always**]
   By default, OSPF PIC is enabled.

Configuring BFD control packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPF PIC.
   ospf primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for OSPF PIC.
   This mode requires BFD configuration on both OSPF routers on the link.

Configuring BFD echo packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.

The source IP address cannot be on the same network segment as any local interfaces.

For more information about this command, see *High Availability Command Reference*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD echo packet mode for OSPF PIC.

   ospf primary-path-detect bfd echo

   By default, BFD echo packet mode is disabled for OSPF PIC.

   This mode requires BFD configuration on one OSPF router on the link.

Configuring advanced OSPF features

Configuring stub routers

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPF routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Router LSAs from the stub router might contain different link type values. A value of 3 means a link to a stub network, and the cost of the link will not be changed by default. To set the cost of the link to 65535, specify the **include-stub** keyword in the **stub-router** command. A value of 1, 2 or 4 means a point-to-point link, a link to a transit network, or a virtual link. On such links, a maximum cost value of 65535 is used. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure the router as a stub router.

   stub-router [**external-lsa** [*max-metric-value*] | **include-stub** | **on-startup** *seconds* | **summary-lsa** [*max-metric-value*]] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPF isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPF isolation works as follows:

1. After OSPF isolation is enabled for a device, OSPF increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is increased to 65535.

- The link cost in the following LSAs is increased to 16711680:
  - Type-3 LSAs (Network summary LSAs).
  - Type-5 LSAs (AS external LSAs).
  - Type-7 LSAs (NSSA external LSAs).

2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPF isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router external-lsa 16711680 summary-lsa 16711680 include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router** commands, follow these restrictions and guidelines:

- If you specify the **external-lsa** and **summary-lsa** keywords in the **stub-router** command, the higher one of the two link costs provided by the isolation feature and the stub router feature takes effect.
- If the **on-startup** keyword is specified in the **stub-router** command, traffic forwarding path selection is affected only by the isolation feature when the stub router feature does not take effect.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPF isolation.
   - Enable OSPF isolation to gracefully isolate the device from the network.

     isolate enable
   - Disable OSPF isolation to gracefully add the device back to the network.

     undo isolate enable

   By default, OSPF isolation is disabled.

Configuring OSPF shutdown

About this task

For maintenance purposes, you can use this feature to shut down OSPF processes on the device with small impact on the network. If you shut down a process, it will perform the following operations:

- Send 1-way hello packets to its neighbors.

  On receipt of the packets, the neighbors disconnect from the OSPF process and use the backup path to forward traffic.
- Stop receiving and sending OSPF packets.
- Clear its neighbor, LSDB, and OSPF route information.

After maintenance, you can use the **undo shutdown process** command to restart the process for neighbor relationship re-establishment.

This feature shuts down an OSPF process while retaining the process-associated settings to facilitate your maintenance.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure OSPF shutdown.

   - Shut down an OSPF process to isolate it from the network.

     shutdown process

   - Restart the OSPF process to add it back to the network.

     undo shutdown process

   By default, the OSPF process is not shut down.

Enabling compatibility with RFC 1583

About this task

RFC 1583 specifies a different method than RFC 2328 for selecting the optimal route to a destination in another AS. When multiple routes are available to the ASBR, OSPF selects the optimal route by using the following procedure:

1. Selects the route with the highest preference.
   - If RFC 2328 is compatible with RFC 1583, all these routes have equal preference.
   - If RFC 2328 is not compatible with RFC 1583, the intra-area route in a non-backbone area is preferred to reduce the burden of the backbone area. The inter-area route and intra-area route in the backbone area have equal preference.
2. Selects the route with the lower cost if two routes have equal preference.
3. Selects the route with the larger originating area ID if two routes have equal cost.

Restrictions and guidelines

To avoid routing loops, set identical RFC 1583-compatibility on all routers in a routing domain.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable compatibility with RFC 1583.

   rfc1583 compatible

   By default, compatibility with RFC 1583 is enabled.

Configuring OSPF GR

About OSPF GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

OSPF GR has the following types:

- **IETF GR**—Uses Opaque LSAs to implement GR.
- **Non-IETF GR**—Uses link local signaling (LLS) to advertise GR capability and uses out of band synchronization to synchronize the LSDB.

A device can act as a GR restarter and GR helper at the same time.

Configuring OSPF GR restarter

Configuring the IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable opaque LSA reception and advertisement capability.
   opaque-capability enable
   By default, opaque LSA reception and advertisement capability is enabled.
4. Enable the IETF GR.
   graceful-restart ietf [**global** | **planned-only**] *
   By default, the IETF GR capability is disabled.
5. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring the non-IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the link-local signaling capability.
   enable link-local-signaling
   By default, the link-local signaling capability is disabled.
4. Enable the out-of-band re-synchronization capability.
   enable out-of-band-resynchronization

By default, the out-of-band re-synchronization capability is disabled.

5. Enable non-IETF GR.
   graceful-restart [**nonstandard**] [**global** | **planned-only**] *
   By default, non-IETF GR capability is disabled.
6. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring OSPF GR helper

Configuring the IETF OSPF GR helper

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable opaque LSA reception and advertisement capability.
   opaque-capability enable
   By default, opaque LSA reception and advertisement capability is enabled.
4. Enable GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, GR helper capability is enabled.
5. (Optional.) Enable strict LSA checking for the GR helper.
   graceful-restart helper strict-lsa-checking
   By default, strict LSA checking for the GR helper is disabled.
   When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Configuring the non-IETF OSPF GR helper

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the link-local signaling capability.
   enable link-local-signaling
   By default, the link-local signaling capability is disabled.
4. Enable the out-of-band re-synchronization capability.
   enable out-of-band-resynchronization
   By default, the out-of-band re-synchronization capability is disabled.
5. Enable GR helper.
   graceful-restart helper enable
   By default, GR helper is enabled.
6. (Optional.) Enable strict LSA checking for the GR helper.
   graceful-restart helper strict-lsa-checking

By default, strict LSA checking for the GR helper is disabled.

When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Triggering OSPF GR

About this task

You can trigger OSPF GR by performing an active/standby switchover or using the **reset ospf process** command.

Procedure

To trigger OSPF GR, execute the **reset ospf** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPF NSR

About this task

Nonstop routing (NSR) backs up OSPF link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPF NSR or OSPF GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPF NSR and OSPF GR as follows:

- **Device requirements**—The active and standby processes of OSPF must run on different IRF member devices. To run OSPF NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPF GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPF GR when the IRF fabric contains only one member device.
- **OSPF neighbor requirements**—When you use OSPF NSR, OSPF neighbors cannot detect process restart or active/standby switchover on the local device. OSPF NSR can recover OSPF route information without requiring the cooperation of OSPF neighbors. OSPF GR requires OSPF neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

If OSPF NSR and OSPF GR are both configured on a device, they operate as follows:

- OSPF NSR takes preference over OSPF GR. That is, when the OSPF active process fails, OSPF NSR ensures service continuity. The device will not start the GR process as a GR restarter.
- After OSPF starts the GR process, an active/standby process switchover might occur on the GR helper before it helps the GR restarter to complete state recovery. In this case, the GR process might fail even if OSPF NSR is configured on the GR helper.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPF NSR.

   non-stop-routing

   By default, OSPF NSR is disabled.

This command takes effect only for the current process. As a best practice, enable OSPF NSR for each process if multiple OSPF processes exist.

Configuring BFD for OSPF

About BFD for OSPF

OSPF sends hello packets to neighbors at specific intervals to detect their state. If OSPF does not receive a hello packet from a neighbor within a specific period, OSPF considers the neighbor down. Such a failure detection method cannot achieve high data reliability, because it takes a long time and causes data loss.

To resolve this issue, configure Bidirectional Forwarding Detection (BFD) for OSPF. This feature improves the route convergence speed against link state changes through fast link state detection. For more information about BFD, see *High Availability Configuration Guide*.

OSPF supports the following BFD detection modes:

- **Bidirectional control detection**—Requires BFD configuration to be made on both OSPF routers on the link.
- **Single-hop echo detection**—Requires BFD configuration to be made on one OSPF router on the link.

Configuring bidirectional control detection

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD bidirectional control detection.
   ospf bfd enable
   By default, BFD bidirectional control detection is disabled.
   Both ends of a BFD session must be on the same network segment and in the same area.

Configuring single-hop echo detection

1. Enter system view.
   system-view
2. Configure the source address of echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source address of echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD single-hop echo detection.
   ospf bfd enable echo
   By default, BFD single-hop echo detection is disabled.

Configuring OSPF authentication

About OSPF area and interface authentication

Perform this task to configure OSPF area and interface authentication.

OSPF adds the authentication information into sent packets, and uses the key to authenticate received packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPF neighbor relationship cannot be established.

If you configure OSPF authentication for both an area and an interface in that area, the interface uses the OSPF authentication configured on it.

Restrictions and guidelines for configuring OSPF authentication

OSPF supports the MD5, HMAC-MD5, and HMAC-SHA-256 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 255.

Configuring OSPF area authentication

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.

   area *area-id*
4. Configure area authentication mode.
   - Configure HMAC-MD5/HMAC-SHA-256/MD5 authentication.

     authentication-mode { **hmac-md5** | **hmac-sha-256** | **md5** } [*key-id* { **cipher** | **plain** } *string*]
   - Configure simple authentication.

     authentication-mode simple [{ **cipher** | **plain** } *string*]
   - Configure keychain authentication.

     authentication-mode keychain *keychain-name*

     For information about keychains, see *Security Configuration Guide*.

   By default, no authentication is configured.

   All routers in an area must use the same authentication mode. If a key is configured, all routers must be configured with the same key.

Configuring OSPF interface authentication

About this task

To prevent an interface from authenticating OSPF packets, configure the None authentication mode on the interface. Then, the interface will not inherit the authentication configuration of the area.

Restrictions and guidelines

The local interface and its peer interface must use the same authentication mode. If a key is configured, the local and peer interfaces must be configured with the same key.

If you configure the None authentication mode on an interface, make sure its peer interface uses the None authentication mode or is not configured with any authentication modes.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure interface authentication mode.
   - Configure simple authentication.
     ospf authentication-mode simple [{ **cipher** | **plain** } *string*]
   - Configure the None authentication mode.
     ospf authentication-mode none
   - Configure HMAC-MD5/HMAC-SHA-256/MD5 authentication.
     ospf authentication-mode { **hmac-md5** | **hmac-sha-256** | **md5** } [*key-id* { **cipher** | **plain** } *string*]
   - Configure keychain authentication.
     ospf authentication-mode keychain *keychain-name*

     For information about keychains, see *Security Configuration Guide*.

   By default, no authentication is configured.

Configuring GTSM for OSPF

About GTSM

The Generalized TTL Security Mechanism (GTSM) protects the device by comparing the TTL value in the IP header of incoming OSPF packets against a valid TTL range. If the TTL value is within the valid TTL range, the packet is accepted. If not, the packet is discarded.

The valid TTL range is from 255 – the configured hop count + 1 to 255.

When GTSM is configured, the OSPF packets sent by the device have a TTL of 255.

Restrictions and guidelines for GTSM

To use GTSM, you must configure GTSM on both the local and peer devices. You can specify different *hop-count* values for them.

The GTSM configuration in OSPF area view applies to all OSPF interfaces in the area. The GTSM configuration in interface view takes precedence over the configuration in OSPF area view.

Configuring GTSM in OSPF area view

1. Enter system view.
   system-view
2. Enter OSPF view.

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Enable GTSM for the OSPF area.

   ttl-security [**hops** *hop-count*]

   By default, GTSM is disabled for the OSPF area.

Configuring GTSM in interface view

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure GTSM for the interface.
   - Enable GTSM for the interface.

     ospf ttl-security [**hops** *hop-count*]
   - Disable GTSM for the interface.

     ospf ttl-security disable

     Disable GTSM for an interface when the following conditions exist:
     - The area to which the interface belongs is enabled with GTSM.
     - The neighbor of the interface does not support GTSM.

   By default, an interface uses the GTSM configuration of the area to which the interface belongs.

Configuring OSPF logging, SNMP notifications, and troubleshooting

Logging neighbor state changes

About this task

Perform this task to enable output of neighbor state change logs to the information center. The information center processes the logs according to user-defined output rules (whether and where to output logs). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable the logging of neighbor state changes.

   log-peer-change

   By default, this feature of logging neighbor state changes is enabled.

Configuring the OSPF logging feature

About this task

OSPF logs include LSA aging logs, route calculation logs, neighbor logs, OSPF route logs, and self-originated and received LSA logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the number of OSPF logs.

   event-log { **hello** { **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] } | **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the device can generate a maximum of 100 OSPF logs for each type.

Configuring OSPF network management

About this task

This task involves the following configurations:

- Bind an OSPF process to MIB so that you can use network management software to manage the specified OSPF process.
- Enable SNMP notifications for OSPF to report important events.
- Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPF events to an NMS, enable SNMP notifications for OSPF. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPF process.

   ospf mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPF.

   snmp-agent trap enable ospf [**authentication-failure** | **bad-packet** | **config-error** | **dr-ip-address-conflict** | **grhelper-status-change** | **grrestarter-status-change** | **if-state-change** | **intra-area-router-id-conflict** | **lsa-maxage** | **lsa-originate** | **lsdb-approaching-overflow** | **lsdb-overflow** | **neighbor-state-change** | **nssatranslator-status-change** | **retransmit** | **virt-authentication-failure** | **virt-bad-packet** | **virt-config-error** | **virt-retransmit** | **virtgrhelper-status-change** | **virtif-state-change** | **virtneighbor-state-change**] *

   By default, SNMP notifications for OSPF are enabled.

4. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

5. Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPF outputs a maximum of seven SNMP notifications within 10 seconds.

Setting the maximum number of OSPF neighbor relationship troubleshooting entries

1. Enter system view.

   system-view

2. Set the maximum number of OSPF neighbor relationship troubleshooting entries.

   ospf troubleshooting max-number *number*

   By default, OSPF can record a maximum of 100 neighbor relationship troubleshooting entries.

Display and maintenance commands for OSPF

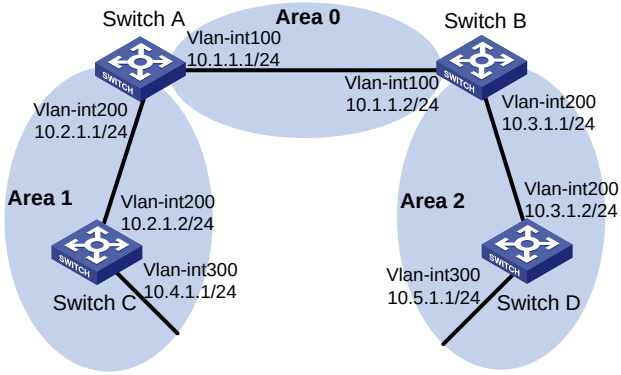
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPF ABR.	**display ospf** [*process-id*] [**area** *area-id*] **abr-summary** [*ip-address* { *mask-length* | *mask* }] [**verbose**]
Display OSPF FRR backup next hop information.	**display ospf** [*process-id*] [**area** *area-id*] **fast-reroute lfa-candidate**
Display OSPF topology information.	**display ospf** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPF process information.	**display ospf** [*process-id*] [**verbose**]
Display OSPF ABR and ASBR information.	**display ospf** [*process-id*] **abr-asbr** [**verbose**]
Display OSPF ASBR route summarization information.	**display ospf** [*process-id*] **asbr-summary** [*ip-address* { *mask-length* | *mask* }]
Display OSPF log information.	**display ospf** [*process-id*] **event-log** { **lsa-flush** | **peer** [*neighbor-id*] [**slot** *slot-number*] | **spf** }
Display OSPF log information about received or sent hello packets.	**display ospf** [*process-id*] **event-log hello** { **received** [**abnormal** | **dropped**] | **sent** } [*neighbor-id*] [**slot** *slot-number*] **display ospf** [*process-id*] **event-log hello sent** { **abnormal** | **failed** } [*neighbor-address*] [**slot** *slot-number*]
Display OSPF GR information.	**display ospf** [*process-id*] **graceful-restart** [**verbose**]

Task	Command
Display OSPF interface information.	**display ospf** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display information about hello packets sent by OSPF interfaces.	**display ospf** [*process-id*] **interface** [*interface-type interface-number*] **hello**
Display OSPF LSDB information.	**display ospf** [*process-id*] [**area** *area-id*] **lsdb** { **asbr** | **network** | **nssa** | **opaque-area** | **opaque-link** | **router** | **summary** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** [**brief** | **originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** { **ase** | **opaque-as** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**]
Display OSPF next hop information.	**display ospf** [*process-id*] **nexthop**
Display OSPF NSR information.	**display ospf** [*process-id*] **non-stop-routing status**
Display OSPF neighbor information.	**display ospf** [*process-id*] **peer** [**hello** | **verbose**] [*interface-type interface-number*] [*neighbor-id*]
Display neighbor statistics for OSPF areas.	**display ospf** [*process-id*] **peer statistics**
Display OSPF request queue information.	**display ospf** [*process-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPF retransmission queue information.	**display ospf** [*process-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPF routing table information.	**display ospf** [*process-id*] **routing** [*ip-address* { *mask-length* | *mask* }] [**interface** *interface-type interface-number*] [**nexthop** *nexthop-address*] [**verbose**]
Display OSPF statistics.	**display ospf** [*process-id*] **statistics** [**error** | **packet** [**hello** | *interface-type interface-number*]]
Display OSPF virtual link information.	**display ospf** [*process-id*] **vlink**
Display the global router ID.	**display router id**
Display OSPF neighbor relationship troubleshooting information.	**display ospf troubleshooting**
Clear OSPF log information.	**reset ospf** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Clear OSPF log information about received or sent hello packets.	**reset ospf** [*process-id*] **event-log hello**

Task	Command
	{ **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] } [**slot** *slot-number*]
Restart an OSPF process.	**reset ospf** [*process-id*] **process** [**graceful-restart**]
Re-enable OSPF route redistribution.	**reset ospf** [*process-id*] **redistribution**
Clear OSPF statistics.	**reset ospf** [*process-id*] **statistics**
Clear OSPF neighbor relationship troubleshooting information.	**reset ospf troubleshooting**

OSPF configuration examples



Example: Configuring basic OSPF

Network configuration

As shown in Figure 9:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs.

Figure 9 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] router id 10.2.1.1
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.1] quit
```

```
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 10.3.1.1
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 2
[SwitchB-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.2] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 10.4.1.1
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] network 10.4.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] router id 10.5.1.1
[SwitchD] ospf
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] network 10.5.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Verifying the configuration

Display information about neighbors on Switch A.

```
[SwitchA] display ospf peer verbose

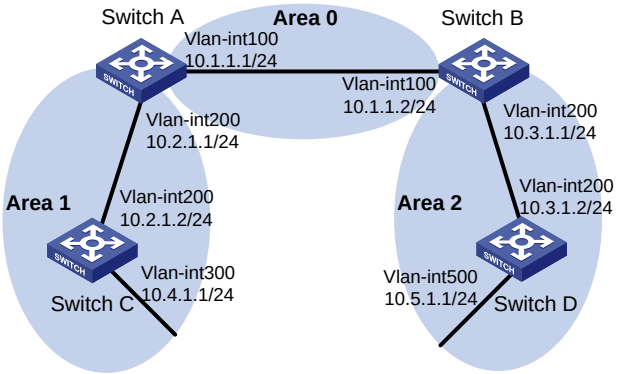
On Switch D, ping the IP address 10.4.1.1 to test reachability.

```
[SwitchD] ping 10.4.1.1
```

```
Ping 10.4.1.1 (10.4.1.1): 56 data bytes, press CTRL+C to break
56 bytes from 10.4.1.1: icmp_seq=0 ttl=253 time=1.549 ms
56 bytes from 10.4.1.1: icmp_seq=1 ttl=253 time=1.539 ms
56 bytes from 10.4.1.1: icmp_seq=2 ttl=253 time=0.779 ms
56 bytes from 10.4.1.1: icmp_seq=3 ttl=253 time=1.702 ms
56 bytes from 10.4.1.1: icmp_seq=4 ttl=253 time=1.471 ms

--- Ping statistics for 10.4.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.779/1.408/1.702/0.323 ms
```



Example: Configuring OSPF route redistribution

Network configuration

As shown in Figure 10:

- Enable OSPF on all the switches.
- Split the AS into three areas.
- Configure Switch A and Switch B as ABRs.
- Configure Switch C as an ASBR to redistribute external routes (static routes).

Figure 10 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure OSPF to redistribute routes:

   # On Switch C, configure a static route destined for network 3.1.2.0/24.

   ```
   <SwitchC> system-view
   [SwitchC] ip route-static 3.1.2.1 24 10.4.1.2
   ```

   # On Switch C, configure OSPF to redistribute static routes.

   ```
   [SwitchC] ospf 1
   [SwitchC-ospf-1] import-route static
   ```

Verifying the configuration

Display the ABR/ASBR information on Switch D.

```
<SwitchD> display ospf abr-asbr
```

```

```

Example: Configuring OSPF route summarization on an ASBR

Network configuration

As shown in Figure 11:

- Configure OSPF on Switch A, Switch B, and Switch C in Area 2.
- Enable OSPF process 1 and process 2 on Switch B. Switch B uses OSPF process 1 to exchange routing information with Switch A, and uses OSPF process 2 to exchange routing information with Switch C.
- Assign IP addresses 2.1.2.1/24, 2.1.3.1/24, and 2.1.4.1/24 to VLAN-interface 200 of Switch A. To enable Switch C to learn routes destined for 2.1.2.0/24, 2.1.3.0/24, 2.1.4.0/24, configure OSPF process 2 on Switch B to redistribute routes from process 1 and direct routes.
- To minimize the size of the routing table on Switch C, configure ASBR route summarization on Switch B. Switch B advertises only the summary route 2.0.0.0/8.

Figure 11 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure OSPF:

   # Enable OSPF process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] router id 11.2.1.1
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ip address 2.1.2.1 24

```

Example: Configuring OSPF stub area

Network configuration

As shown in Figure 12:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.
- Configure Switch D as the ASBR to redistribute static routes.
- Configure Area 1 as a stub area to reduce advertised LSAs without influencing reachability.

Figure 12 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure route redistribution:

   # Configure Switch D to redistribute static routes.

```
<SwitchD> system-view
[SwitchD] ip route-static 3.1.2.1 24 10.5.1.2
[SwitchD] ospf
[SwitchD-ospf-1] import-route static
[SwitchD-ospf-1] quit
```

   # Display ABR/ASBR information on Switch C.

```
<SwitchC> display ospf abr-asbr

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table to ABR and ASBR

                Topology base (MTID 0)
 Type        Destination     Area            Cost   Nexthop         RtType

```

   # Display OSPF routing table on Switch C.

```
<SwitchC> display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                   Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
 10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
 10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1
```

```
 Routing for ASEs
 Destination        Cost     Type    Tag         NextHop         AdvRouter
 3.1.2.0/24         1        Type2   1           10.2.1.1        10.5.1.1

 Total nets: 6
 Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that Switch C's routing table contains an AS external route.

4. Configure Area 1 as a stub area:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] stub
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display OSPF routing information on Switch C

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
 10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
 10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1

 Total nets: 6
 Intra area: 2  Inter area: 4  ASE: 0  NSSA: 0
```

The output shows that a default route replaces the AS external route.

Configure Area 1 as a totally stub area.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub no-summary
[SwitchA-ospf-1-area-0.0.0.1] quit
```

```
[SwitchA-ospf-1] quit
```

Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

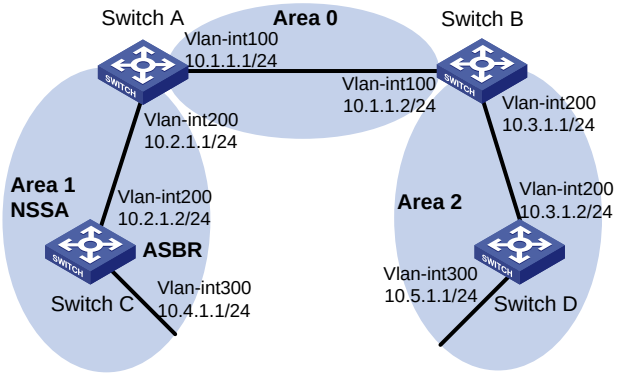
          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.2.1.0/24        3        Transit 0.0.0.0         10.4.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1

 Total nets: 3
 Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that inter-area routes are removed, and only one external route (a default route) exists on Switch C.



Example: Configuring OSPF NSSA area

Network configuration

As shown in Figure 13:

- Configure OSPF on all switches and split AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch C as an ASBR to redistribute static routes into the AS.

Figure 13 Network diagram

Procedure

1. Configure IP addresses for interfaces.
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] nssa
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] nssa
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1

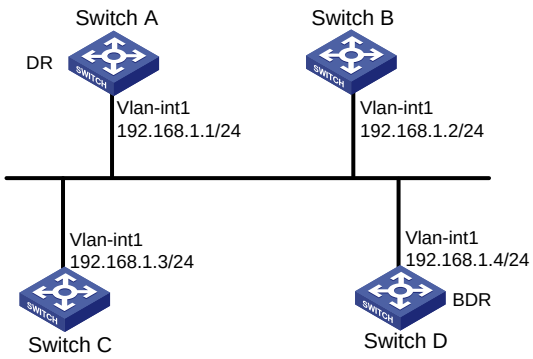
10.5.1.0/24        10       Stub    10.5.1.1        10.5.1.1        0.0.0.2
10.1.1.0/24        12       Inter   10.3.1.1        10.3.1.1        0.0.0.2

Routing for ASEs
Destination        Cost     Type    Tag         NextHop         AdvRouter
3.1.3.0/24         1        Type2   1           10.3.1.1        10.2.1.1

Total nets: 6
Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that an external route imported from the NSSA area exists on Switch D.



Example: Configuring OSPF DR election

Network configuration

As shown in Figure 14:

- Enable OSPF on Switches A, B, C, and D on the same network.
- Configure Switch D as the DR, and configure Switch C as the BDR.
- Change the router priorities on the interfaces to configure Switch A as the DR and Switch C as the BDR.

Figure 14 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic OSPF settings on all switches. (Details not shown.)

   For more information, see "Example: Configuring basic OSPF."
3. Display OSPF neighbor information on Switch A.

```
[SwitchA] display ospf peer verbose

          OSPF Process 1 with Router ID 1.1.1.1
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.1(Vlan-interface1)'s neighbors
 Router ID: 2.2.2.2          Address: 192.168.1.2      GR State: Normal
   State: 2-Way  Mode: None  Priority: 1
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
```

```
  Dead timer due in 38  sec
  Neighbor is up for 00:01:31
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
  State: Full  Mode: Nbr is master  Priority: 1
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 31  sec
  Neighbor is up for 00:01:28
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled

 Router ID: 4.4.4.4          Address: 192.168.1.4      GR State: Normal
  State: Full  Mode: Nbr is master  Priority: 1
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 31  sec
  Neighbor is up for 00:01:28
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled
```

The output shows that Switch D is the DR and Switch C is the BDR.

4. Configure router priorities on interfaces:

Configure Switch A.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ospf dr-priority 100
[SwitchA-Vlan-interface1] quit
```

Configure Switch B.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ospf dr-priority 0
[SwitchB-Vlan-interface1] quit
```

Configure Switch C.

```
[SwitchC] interface vlan-interface 1
[SwitchC-Vlan-interface1] ospf dr-priority 2
[SwitchC-Vlan-interface1] quit
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose

          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1      Address: 192.168.1.1      GR State: Normal
  State: Full  Mode:Nbr is  slave  Priority: 100
```

```
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 31  sec
   Neighbor is up for 00:11:17
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2      Address: 192.168.1.2      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 0
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:11:19
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 3.3.3.3      Address: 192.168.1.3      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 2
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 33  sec
   Neighbor is up for 00:11:15
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

The output shows that the DR and BDR are not changed, because the priority settings do not take effect immediately.

5. Restart OSPF processes:

Restart the OSPF process of Switch A.

```
<SwitchA> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch B.

```
<SwitchB> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch C.

```
<SwitchC> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch D.

```
<SwitchD> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose

          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors
```

```
 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1          Address: 192.168.1.1      GR State: Normal
   State: Full  Mode: Nbr is slave  Priority: 100
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 39  sec
   Neighbor is up for 00:01:40
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2          Address: 192.168.1.2      GR State: Normal
   State: 2-Way  Mode: None  Priority: 0
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:01:44
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
   State: Full  Mode: Nbr is slave  Priority: 2
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 39  sec
   Neighbor is up for 00:01:41
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

The output shows that Switch A becomes the DR and Switch C becomes the BDR.

If the neighbor state is *full,* Switch D has established an adjacency with the neighbor. If the neighbor state is *2-way*, the two switches are not the DR or the BDR, and they do not exchange LSAs.

Display OSPF interface information.

```
<SwitchA> display ospf interface

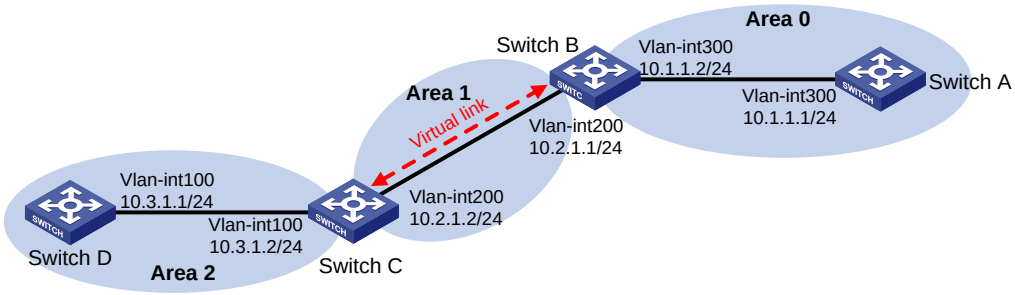
          OSPF Process 1 with Router ID 1.1.1.1
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type      State   Cost  Pri   DR             BDR
 192.168.1.1     Broadcast DR      1     100   192.168.1.1    192.168.1.3

<SwitchB> display ospf interface

          OSPF Process 1 with Router ID 2.2.2.2
                  Interfaces
```

```
Area: 0.0.0.0
IP Address      Type       State     Cost  Pri   DR            BDR
192.168.1.2     Broadcast  DROther   1     0     192.168.1.1   192.168.1.3
```



The interface state *DROther* means the interface is not the DR or BDR.

Example: Configuring OSPF virtual link

Network configuration

As shown in Figure 15, configure a virtual link between Switch B and Switch C to connect Area 2 to the backbone area. After configuration, Switch B can learn routes to Area 2.

Figure 15 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf 1 router-id 1.1.1.1
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf 1 router-id 2.2.2.2
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 1
[SwitchB–ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchB–ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf 1 router-id 3.3.3.3
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
```

```
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] area 2
[SwitchC–ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchC–ospf-1-area-0.0.0.2] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] ospf 1 router-id 4.4.4.4
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

          OSPF Process 1 with Router ID 2.2.2.2
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
 10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0
 Total nets: 2
 Intra area: 2  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows that Switch B does not have routes to Area 2 because Area 0 is not directly connected to Area 2.

3. Configure a virtual link:

Configure Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 1
[SwitchB-ospf-1-area-0.0.0.1] vlink-peer 3.3.3.3
[SwitchB-ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] vlink-peer 2.2.2.2
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

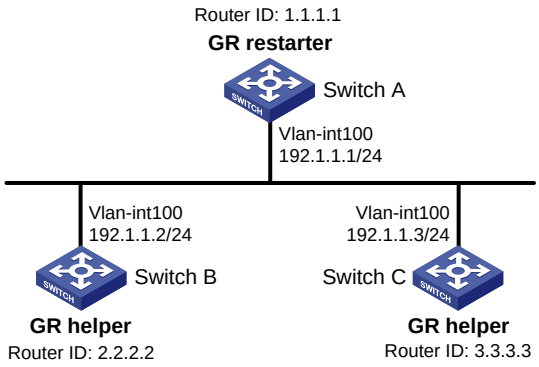
          OSPF Process 1 with Router ID 2.2.2.2
                  Routing Table

                Topology base (MTID 0)
```

```
Routing for network
Destination        Cost     Type    NextHop         AdvRouter       Area
10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
10.3.1.0/24        5        Inter   10.2.1.2        3.3.3.3         0.0.0.0
10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0

Total nets: 3
Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that Switch B has learned the route 10.3.1.0/24 to Area 2.



Example: Configuring OSPF GR

Network configuration

As shown in Figure 16:

- Switch A, Switch B, and Switch C that belong to the same AS and the same OSPF routing domain are GR capable.
- Switch A acts as the non-IETF GR restarter. Switch B and Switch C are the GR helpers, and synchronize their LSDBs with Switch A through OOB communication of GR.

Figure 16 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
SwitchA> system-view
[SwitchA] router id 1.1.1.1
[SwitchA] ospf 100
[SwitchA-ospf-100] area 0
[SwitchA-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchA-ospf-100-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 2.2.2.2
[SwitchB] ospf 100
[SwitchB-ospf-100] area 0
```

```
[SwitchB-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchB-ospf-100-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 3.3.3.3
[SwitchC] ospf 100
[SwitchC-ospf-100] area 0
[SwitchC-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchC-ospf-100-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

3. Configure OSPF GR:

Configure Switch A as the non-IETF OSPF GR restarter: enable the link-local signaling capability, the out-of-band re-synchronization capability, and non-IETF GR capability for OSPF process 100.

```
[SwitchA-ospf-100] enable link-local-signaling
[SwitchA-ospf-100] enable out-of-band-resynchronization
[SwitchA-ospf-100] graceful-restart
[SwitchA-ospf-100] quit
```

Configure Switch B as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchB-ospf-100] enable link-local-signaling
[SwitchB-ospf-100] enable out-of-band-resynchronization
```

Configure Switch C as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchC-ospf-100] enable link-local-signaling
[SwitchC-ospf-100] enable out-of-band-resynchronization
```

Verifying the configuration

Enable OSPF GR event debugging and restart the OSPF process by using GR on Switch A.

```
<SwitchA> debugging ospf event graceful-restart
<SwitchA> terminal monitor
<SwitchA> terminal logging level 7
<SwitchA> reset ospf 100 process graceful-restart
Reset OSPF process? [Y/N]:y

192.1.1.2(Vlan-interface100) from Loading to Full.
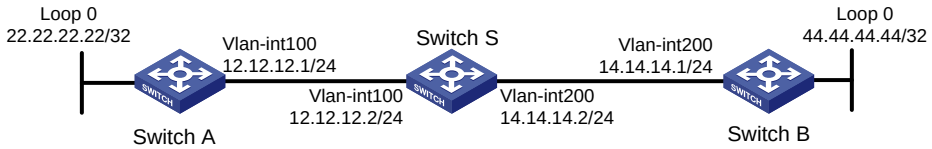
```



The output shows that Switch A completes GR.

Example: Configuring OSPF NSR

Network configuration

As shown in Figure 17, Switch S, Switch A, and Switch B belong to the same OSPF routing domain. Enable OSPF NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 17 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPF on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with OSPF.
3. Configure OSPF NSR:

   # Enable OSPF NSR on Switch S.

   ```
   <SwitchS> system-view
   [SwitchS] ospf 100
   [SwitchS-ospf-100] non-stop-routing
   [SwitchS-ospf-100] quit
   ```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```
[SwitchS] placement reoptimize
Predicted changes to the placement
Service Group(instance name)                        Cur location  New location

Total nets: 4
Intra area: 4  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows the following when an active/standby switchover occurs on Switch S:

- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring BFD for OSPF

Network configuration

As shown in Figure 18, run OSPF on Switch A, Switch B, and Switch C so that they are reachable to each other at the network layer.

- When the link over which Switch A and Switch B communicate through a Layer 2 switch fails, BFD can quickly detect the failure and notify OSPF of the failure.
- Switch A and Switch B then communicate through Switch C.

Figure 18 Network diagram

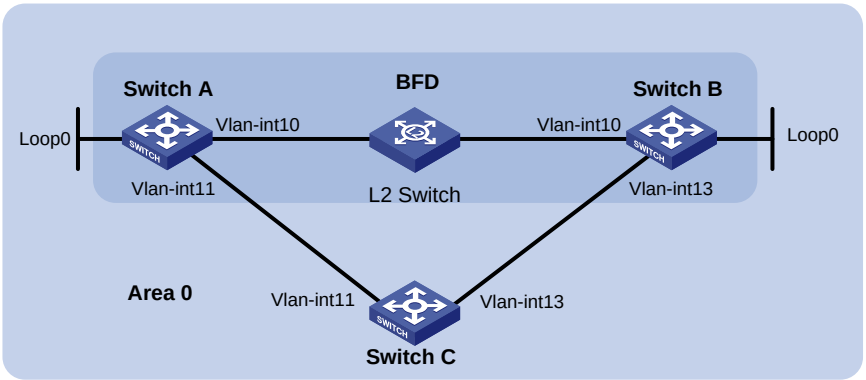

Table 4 Interface and IP address assignment

Device	Interface	IP address
Switch A	Vlan-int10	192.168.0.102/24
Switch A	Vlan-int11	10.1.1.102/24
Switch A	Loop0	121.1.1.1/32
Switch B	Vlan-int10	192.168.0.100/24
Switch B	Vlan-int13	13.1.1.1/24
Switch B	Loop0	120.1.1.1/32
Switch C	Vlan-int11	10.1.1.100/24
Switch C	Vlan-int13	13.1.1.2/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 121.1.1.1 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 120.1.1.1 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

3. Configure BFD:

   # Enable BFD on Switch A and configure BFD parameters.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
```

```
[SwitchA-Vlan-interface10] ospf bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

Enable BFD on Switch B and configure BFD parameters.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospf bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
<SwitchA> display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv4 session working in control packet mode:

 LD/RD            SourceAddr      DestAddr        State  Holdtime    Interface
 3/1              192.168.0.102   192.168.0.100   Up     1700ms      Vlan10
```

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary count : 1

Destination: 120.1.1.1/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 1              Preference: 10
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                 State: Active Adv
  OrigTblID: 0x0              OrigVrf: default-vrf
    TableID: 0x2               OrigAs: 0
      NibID: 0x26000002        LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 192.168.0.100
      Label: NULL           RealNextHop: 192.168.0.100
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface10
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
```

```
   LinkCost: 0               MicroSegID: 0
RealFIRType: Normal           RealThres: 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary count : 1

Destination: 120.1.1.1/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s

      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 10.1.1.100
      Label: NULL           RealNextHop: 10.1.1.100
    BkLabel: NULL            B kNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface11
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
   LinkCost: 0               MicroSegID: 0
RealFIRType: Normal           RealThres: 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Troubleshooting OSPF configuration

No OSPF neighbor relationship established

Symptom

No OSPF neighbor relationship can be established.

Analysis

If the physical link and lower layer protocols work correctly, verify OSPF parameters configured on interfaces. Two neighbors must have the same parameters, such as the area ID, network segment, and mask. (A P2P or virtual link can have different network segments and masks.)

Solution

To resolve the problem:

1. Use the **`display ospf peer`** command to verify OSPF neighbor information.

2. Use the **display ospf interface** command to verify OSPF interface information.
3. Ping the neighbor router's IP address to verify that the connectivity is normal.
4. Verify OSPF timers. The dead interval on an interface must be a minimum of four times the hello interval.
5. On an NBMA network, use the **peer ip-address** command to manually specify the neighbor.
6. A minimum of one interface must have a router priority higher than 0 on an NBMA or a broadcast network.
7. If the problem persists, contact H3C Support.

Incorrect routing information

Symptom

OSPF cannot find routes to other areas.

Analysis

The backbone area must maintain connectivity to all other areas. If a router connects to more than one area, a minimum of one area must be connected to the backbone. The backbone cannot be configured as a stub area.

In a stub area, all routers cannot receive external routes, and all interfaces connected to the stub area must belong to the stub area.

Solution

To resolve the problem:

1. Use the **display ospf peer** command to verify neighbor information.
2. Use the **display ospf interface** command to verify OSPF interface information.
3. Use the **display ospf lsdb** command to verify the LSDB.
4. Use the **display current-configuration configuration ospf** command to verify area configuration. If more than two areas are configured, a minimum of one area is connected to the backbone.
5. In a stub area, all routers attached are configured with the **stub** command. In an NSSA area, all routers attached are configured with the **nssa** command.
6. If a virtual link is configured, use the **display ospf vlink** command to verify the state of the virtual link.
7. If the problem persists, contact H3C Support.

Configuring PBR

About PBR

Policy-based routing (PBR) uses user-defined policies to route packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop .

Packet forwarding process

When the device receives a packet, the device searches the PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route to forward the packet if one of the following conditions exists:
    - No next hops are specified on the node.
    - Forwarding failed based on the next hops.
- The device perfoms routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

PBR types

PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface.

Policy

A policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

A policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup.

Relationship between if-match clauses

PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **apply** clauses for a node, but some of them might not be executed. For more information about relationship between **apply** clauses, see "Configuring actions for a node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	Permit	**Deny**

Yes.	• If the node contains **apply** clauses, PBR executes the **apply** clauses on the node.
	  ○ If PBR-based forwarding succeeds, PBR does not compare the packet with the next node.
	  ○ If PBR-based forwarding fails, PBR does not compare the packet with the next node.
	• If the node does not contain **apply** clauses, the device performs a routing table lookup for the packet.
		The device performs a routing table lookup for the packet.

No.	PBR compares the packet with the next node.	PBR compares the packet with the next node.

NOTE:

A node that has no **if-match** clauses matches any packet.

PBR and Track

PBR can work with the Track feature to dynamically adapt the availability status of an **apply** clause to the link status of a tracked object. The tracked object can be a next hop.

- When the track entry associated with an object changes to **Negative**, the **apply** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **apply** clause is valid.

For more information about Track and PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: PBR configuration

If a packet destined for the local device matches a PBR policy, PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure a PBR policy, be careful to avoid this situation.

PBR tasks at a glance

To configure PBR, perform the following tasks:

1. Configuring a policy
   a. Creating a node
   b. Setting match criteria for a node

c. Configuring actions for a node

2. Specifying a policy for PBR

   Choose the following tasks as needed:

   - Specifying a policy for local PBR
   - Specifying a policy for interface PBR

Configuring a policy

Creating a node

1. Enter system view.

   system-view

2. Create a node for a policy, and enter its view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. (Optional.) Configure a description for the policy node.

   description *text*

   By default, no description is configured for a policy node.

Setting match criteria for a node

Procedure

1. Enter system view.

   system-view

2. Enter policy node view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Set match criteria.

   - Set an ACL match criterion.

     if-match acl { *acl-number* | **name** *acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

     When using the ACL to match packets, PBR ignores the action (**permit** or **deny**) and time range settings in the ACL. If the specified ACL does not exist, no packets will match this criterion.

Configuring actions for a node

About this task

The **apply** clauses allow you to specify the actions to be taken on matching packets on a node.

Restrictions and guidelines

If you specify a next hop, PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if PBR does not update the route immediately after its availability status changes.

Configuring actions to direct packet forwarding

1. Enter system view.

system-view

2. Enter policy node view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions.

   - Set next hops.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ip-address* [**direct**] [**track** *track-entry-number*] }&<1-2>

     By default, no next hops are specified.

     On a node, you can specify a maximum of two next hops for backup in one command line or by executing this command multiple times.

     If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

Specifying a policy for PBR

Specifying a policy for local PBR

About this task

Perform this task to specify a policy for local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

Local PBR might affect local services such as ping and Telnet. When you use local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view

2. Specify a policy for local PBR.

   ip local policy-based-route *policy-name*

   By default, local PBR is not enabled.

Specifying a policy for interface PBR

About this task

Perform this task to apply a policy to an interface to guide the forwarding of packets received on the interface.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you can apply a new interface PBR policy to an interface, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.

system-view

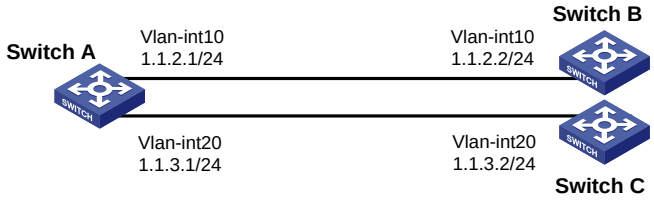
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a policy for interface PBR.
   ip policy-based-route *policy-name*
   By default, no interface policy is applied to an interface.

Display and maintenance commands for PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PBR policy information.	**display ip policy-based-route** [**policy** *policy-name*]
Display interface PBR configuration and statistics.	**display ip policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display local PBR configuration and statistics.	**display ip policy-based-route local** [**slot** *slot-number*]
Display PBR configuration.	**display ip policy-based-route setup**
Clear PBR statistics.	**reset ip policy-based-route statistics** [**policy** *policy-name*]

PBR configuration examples



Example: Configuring packet type-based local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets to the next hop 1.1.2.2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IP addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ip address 1.1.2.1 24
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.3.1 24
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3101 to match TCP packets.

   ```
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule permit tcp
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

   ```
   [SwitchA] policy-based-route aaa permit node 5
   [SwitchA-pbr-aaa-5] if-match acl 3101
   [SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
   [SwitchA-pbr-aaa-5] quit
   ```

   # Configure local PBR by applying the policy **aaa** to Switch A.

   ```
   [SwitchA] ip local policy-based-route aaa
   ```

2. Configure Switch B:

   # Create VLAN 10.

   ```
   <SwitchB> system-view
   [SwitchB] vlan 10
   [SwitchB-vlan10] quit
   ```

   # Configure the IP address of VLAN-interface 10.

   ```
   [SwitchB] interface vlan-interface 10
   [SwitchB-Vlan-interface10] ip address 1.1.2.2 24
   [SwitchB-Vlan-interface10] quit
   ```

3. Configure Switch C:

   # Create VLAN 20.

   ```
   <SwitchC> system-view
   [SwitchC] vlan 20
   ```

```
[SwitchC-vlan20] quit
```

Configure the IP address of VLAN-interface 20.

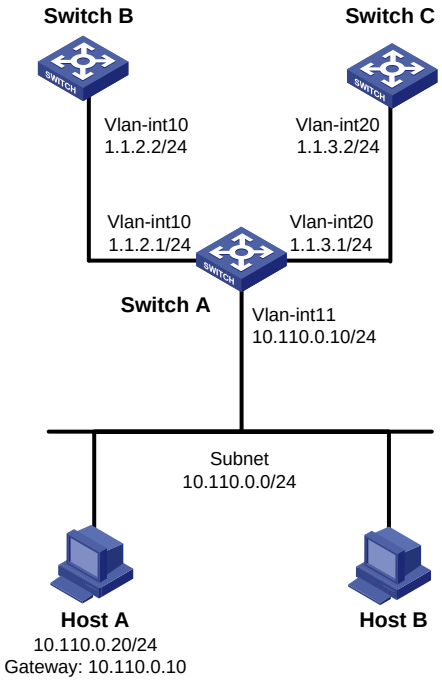
```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ip address 1.1.3.2 24
[SwitchC-Vlan-interface20] quit
```

Verifying the configuration

1. Perform telnet operations to verify that local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)
2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1.1.2.2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IP addresses and unicast routing protocol settings to make sure Switch B and Switch C can reach Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3101 to match TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl advanced 3101
   ```

```
[SwitchA-acl-ipv4-adv-3101] rule permit tcp
[SwitchA-acl-ipv4-adv-3101] quit
```

Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

```
[SwitchA] policy-based-route aaa permit node 5
[SwitchA-pbr-aaa-5] if-match acl 3101
[SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
[SwitchA-pbr-aaa-5] quit
```

Configure interface PBR by applying the policy **aaa** to VLAN-interface 11.

```
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ip policy-based-route aaa
[SwitchA-Vlan-interface11] quit
```

Verifying the configuration

1. Perform telnet operations to verify that interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)

Configuring IPv6 static routing

About IPv6 static routing

Static routes are manually configured and cannot adapt to network topology changes. If a fault or a topological change occurs in the network, the network administrator must modify the static routes manually. IPv6 static routing works well in a simple IPv6 network.

Configuring an IPv6 static route

1. Enter system view.

   system-view

2. Configure an IPv6 static route.

   Public network:

   ipv6 route-static *ipv6-address prefix-length interface-type interface-number* [*next-hop-address*] [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**recursive-lookup**] [**description** *text*]

   ipv6 route-static *ipv6-address prefix-length* { *next-hop-address* [**recursive-lookup host-route**] | **vpn-instance** *d-vpn-instance-name next-hop-address* [**recursive-lookup host-route**] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**recursive-lookup**] [**description** *text*]

   ipv6 route-static *ipv6-address prefix-length interface-type interface-number next-hop-address* **track-nd** [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no IPv6 static route is configured.

   The **recursive-lookup host-route** and **recursive-lookup** keywords are mutually exclusive. You cannot specify both of the keywords.

   VPN:

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length interface-type interface-number* [*next-hop-address*] [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**recursive-lookup**] [**description** *text*]

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *next-hop-address* [**recursive-lookup host-route**] [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* [**recursive-lookup host-route**] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**recursive-lookup**] [**description** *text*]

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length interface-type interface-number next-hop-address* **track-nd** [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no IPv6 static route is configured.

   The **recursive-lookup host-route** and **recursive-lookup** keywords are mutually exclusive. You cannot specify both of the keywords.

3. (Optional.) Set the default preference for IPv6 static routes.

ipv6 route-static default-preference *default-preference*

The default setting is 60.

Configuring IPv6 floating static routes

Perform this task to configure route backup to improve network reliability.

When an IPv6 static or dynamic route to a destination address already exists on the device, you configure another IPv6 static route with a lower priority as the backup route to improve the network reliability. This backup IPv6 static route is called an IPv6 floating static route and is activated only when the primary route fails. After the primary route recovers from failure, the IPv6 floating static route becomes inactive and data forwarding switches back to the primary route.

An IPv6 floating static route can be configured in either of the following ways

- Configure different priorities for multiple IPv6 static routes to the same destination address. The route with the lower priority automatically becomes the IPv6 floating static route.
- When an IPv6 route to a destination address already exists on the device, configure an IPv6 static route with a lower priority to the same destination address.

When you configure an IPv6 floating static route, the priority value of the route must be larger than then priority value of the primary route. For more information, see "Configuring an IPv6 static route."

Deleting IPv6 static routes

About this task

To delete an IPv6 static route, use the **undo ipv6 route-static** command. To delete all IPv6 static routes including the default route, use the **delete ipv6 static-routes all** command.

Procedure

1. Enter system view.

   system-view

2. Delete all IPv6 static routes, including the default route.

   delete ipv6 [**vpn-instance** *vpn-instance-name*] **static-routes all**

CAUTION:

Deleting all IPv6 static routes with caution. This operation might cause network connectivity failure and packet forwarding failure.

Configuring BFD for IPv6 static routes

About BFD for IPv6 static routes

BFD provides a general purpose, standard, and medium- and protocol-independent fast failure detection mechanism. It can uniformly and quickly detect the failures of the bidirectional forwarding paths between two routers for protocols, such as routing protocols. BFD for IPv6 static routes tests the reachability of the next hop for each IPv6 static route. If a next hop is unreachable, BFD deletes the associated IPv6 static route.

For more information about BFD, see *High Availability Configuration Guide*.

Restrictions and guidelines for BFD

When you configure BFD for IPv6 static routes, follow these restrictions and guidelines:

- If you specify a source IPv6 address for BFD packets on the local device, you must specify that IPv6 address as the next hop IPv6 address on the peer device.
- If you specify a non-P2P output interface and a direct next hop, specify the **bfd-source** *ipv6-address* option as a best practice. Make sure the source IPv6 address of BFD packets meets the following requirements:
  - The address is the same as the IPv6 address of the output interface.
  - The address is on the same network segment as the next hop IPv6 address of the same type.

    For example, if the next hop IPv6 address is a link-local address, the source IPv6 address of BFD packets must also be a link-local address.
- Enabling BFD for a flapping route could worsen the situation.

Configuring BFD control packet mode

About this task

This mode uses BFD control packets to detect the status of a link bidirectionally at a millisecond level.

BFD control packet mode can be applied to IPv6 static routes with a direct next hop or with an indirect next hop.

Restrictions and guidelines for BFD control packet mode

If you configure BFD control packet mode at the local end, you must also configure this mode at the peer end.

Configuring BFD control packet mode for an IPv6 static route (direct next hop)

1. Enter system view.

   system-view
2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd control-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD control packet mode for an IPv6 static route (indirect next hop)

1. Enter system view.

   system-view
2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length* [**vpn-instance** *d-vpn-instance-name*] { *next-hop-address* [**recursive-lookup host-route**] **bfd control-packet bfd-source** *ipv6-address* } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD echo packet mode

About this task

With BFD echo packet mode enabled for a static route, the output interface sends BFD echo packets to the destination device, which loops the packets back to test the link reachability.

Restrictions and guidelines

You do not need to configure BFD echo packet mode at the peer end.

Do not use BFD for a static route with the output interface in spoofing state.

Procedure

1. Enter system view.

   system-view

2. Configure the source address of echo packets.

   bfd echo-source-ipv6 *ipv6-address*

   By default, the source address of echo packets is not configured.

   As a best practice to avoid network congestion caused by excessive ICMPv6 redirect packets from the peer, use this command. Make sure the source IPv6 address is not on the subnet of any interfaces on the device.

   The source IPv6 address of echo packets can only be the global unicast address.

   For more information about this command, see *High Availability Command Reference*.

3. Configure BFD echo packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd echo-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD echo packet mode for an IPv6 static route is not configured.

   The next hop IPv6 address must be a global unicast address.

Enabling periodic sending of ND requests to the next hops of IPv6 static routes

About this task

As a best practice, use this feature when the following types of IPv6 static routes exist on the device:

- IPv6 static routes that recurse to host routes, which include the following IPv6 static routes:
  - IPv6 static routes with the **recursive-lookup host-route** keywords specified to recurse only to host routes.
  - IPv6 static routes that recurse to host routes according to routing policies (configured by using the **protocol nexthop recursive-lookup** command).

  The device might delete the ND entry for the next hop host address of an IPv6 static route after that entry ages out because the device cannot update that entry in time. As a result, the device does not have the host route of the directly connected device in the IPv6 routing table for that IPv6 static route. In this case, route recursion fails and that IPv6 static route cannot be activated.
- IPv6 static routes with the **track-nd** keyword specified to associate their next hops with the ND entries for these next hops.

The device might delete the ND entry for the next hop address of an IPv6 static route after that entry ages out because the device cannot update that entry in time. As a result, that IPv6 static route cannot be activated.

For IPv6 static routes that recurse to host routes, the **ipv6 route-static nd-request** command enables the device to periodically send ND requests to the next hops of the IPv6 static routes that meet the following requirements:

- The IPv6 static routes have no output interfaces specified.
- The IPv6 static routes fail the next-hop recursion.

When the device receives an ND response from the next hop host of an IPv6 static route, it automatically performs the following operations:

1. Adds the host route to the routing table.
2. Activates the IPv6 static route that recurses to the host route.
3. Stops sending ND requests to the host.

For IPv6 static routes with the **track-nd** keyword specified, the **ipv6 route-static nd-request** command enables the device to periodically send ND requests to the next hops of the IPv6 static routes associated with next hop ND entries. When the device receives an ND response from the next hop of an IPv6 static route, it automatically activates that IPv6 static route and stops sending ND requests to the next hop of that IPv6 static route.

Procedure

1. Enter system view.

   system-view
2. Enable periodic sending of ND requests to the next hops of IPv6 static routes.

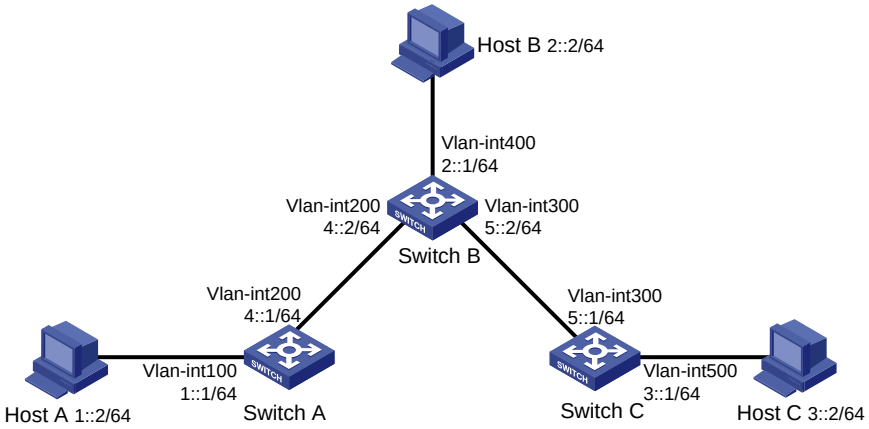
   ipv6 route-static nd-request [**interval** *interval*]

   By default, periodic sending of ND requests to the next hops of IPv6 static routes is disabled.

Display and maintenance commands for IPv6 static routing

Execute **display** commands in any view.

Task	Command
Display IPv6 static route next hop information.	**display ipv6 route-static nib** [*nib-id*] [**verbose**]
Display IPv6 static routing table information.	**display ipv6 route-static routing-table** [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length*]
Display IPv6 static route information.	**display ipv6 routing-table protocol static** [**inactive** | **verbose**]



IPv6 static routing configuration examples

Example: Configuring basic IPv6 static route

Network configuration

As shown in Figure 1, configure IPv6 static routes so that hosts can reach one another.

Figure 1 Network diagram

Procedure

1. Configure the IPv6 addresses for all VLAN interfaces. (Details not shown.)
2. Configure IPv6 static routes:

   # Configure a default IPv6 static route on Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 route-static :: 0 4::2
   ```

   # Configure two IPv6 static routes on Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 route-static 1:: 64 4::1
   [SwitchB] ipv6 route-static 3:: 64 5::1
   ```

   # Configure a default IPv6 static route on Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 route-static :: 0 5::2
   ```

3. Configure the IPv6 addresses for all the hosts and configure the default gateway of Host A, Host B, and Host C as 1::1, 2::1, and 3::1.

Verifying the configuration

Display the IPv6 static route information on Switch A.

```
[SwitchA] display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: ::/0                                   Protocol  : Static
NextHop    : 4::2                                   Preference: 60
```

```
Interface  : Vlan200                                Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Display the IPv6 static route information on Switch B.

```
[SwitchB] display ipv6 routing-table protocol static

Summary count : 2

Static Routing table status : <Active>
Summary count : 2

Destination: 1::/64                                 Protocol  : Static
NextHop    : 4::1                                   Preference: 60
Interface  : Vlan200                                Cost      : 0

Destination: 3::/64                                 Protocol  : Static
NextHop    : 5::1                                   Preference: 60
Interface  : Vlan300                                Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Use the **ping** command to test the reachability.

```
[SwitchA] ping ipv6 3::1
Ping6(56 data bytes) 4::1 --> 3::1, press CTRL+C to break
56 bytes from 3::1, icmp_seq=0 hlim=62 time=0.700 ms
56 bytes from 3::1, icmp_seq=1 hlim=62 time=0.351 ms
56 bytes from 3::1, icmp_seq=2 hlim=62 time=0.338 ms
56 bytes from 3::1, icmp_seq=3 hlim=62 time=0.373 ms
56 bytes from 3::1, icmp_seq=4 hlim=62 time=0.316 ms

--- Ping6 statistics for 3::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.316/0.416/0.700/0.143 ms
```

Example: Configuring BFD for IPv6 static routes (direct next hop)

Network configuration

As shown in Figure 2:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on Switch C.

When the link between Switch A and Switch B through the Layer 2 switch fails, BFD can detect the failure immediately, and Switch A and Switch B can communicate through Switch C.

Figure 2 Network diagram

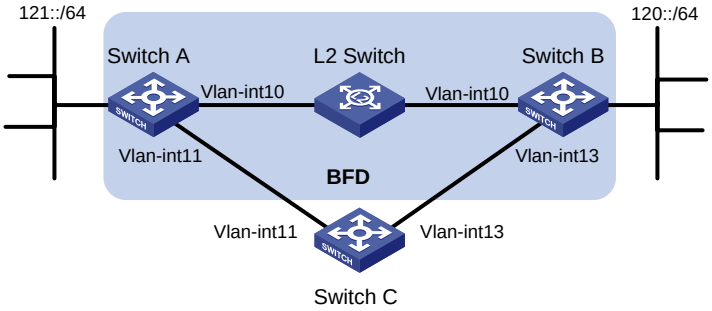


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch B	Vlan-int10	12::2/64
Switch B	Vlan-int13	13::1/64
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 10
[SwitchA-vlan-interface10] bfd min-transmit-interval 500
[SwitchA-vlan-interface10] bfd min-receive-interval 500
[SwitchA-vlan-interface10] bfd detect-multiplier 9
[SwitchA-vlan-interface10] quit
[SwitchA] ipv6 route-static 120:: 64 vlan-interface 10 12::2 bfd control-packet
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 10
[SwitchB-vlan-interface10] bfd min-transmit-interval 500
[SwitchB-vlan-interface10] bfd min-receive-interval 500
[SwitchB-vlan-interface10] bfd detect-multiplier 9
[SwitchB-vlan-interface10] quit
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 10 12::1 bfd control-packet
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 13 13::2 preference 65
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv6 session working in control packet mode:

       Local Discr: 513                Remote Discr: 33
         Source IP: 12::1
    Destination IP: 12::2
     Session State: Up                     Interface: Vlan10
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                Protocol  : Static
NextHop    : 12::2                                   Preference: 60
Interface  : Vlan10                                  Cost      : 0

Direct Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                Protocol  : Static
NextHop    : 10::100                                 Preference: 65
Interface  : Vlan11                                  Cost      : 0

Static Routing table status : < Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring BFD for IPv6 static routes (indirect next hop)

Network configuration

As shown in Figure 3:

- Switch A has a route to interface Loopback 1 (2::9/128) on Switch B, and the output interface is VLAN-interface 10.
- Switch B has a route to interface Loopback 1 (1::9/128) on Switch A, and the output interface is VLAN-interface 12.
- Switch D has a route to 1::9/128, and the output interface is VLAN-interface 10. It also has a route to 2::9/128, and the output interface is VLAN-interface 12.

Configure the following:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on both Switch C and Switch D.

When the link between Switch A and Switch B through Switch D fails, BFD can detect the failure immediately and Switch A and Switch B can communicate through Switch C.

Figure 3 Network diagram

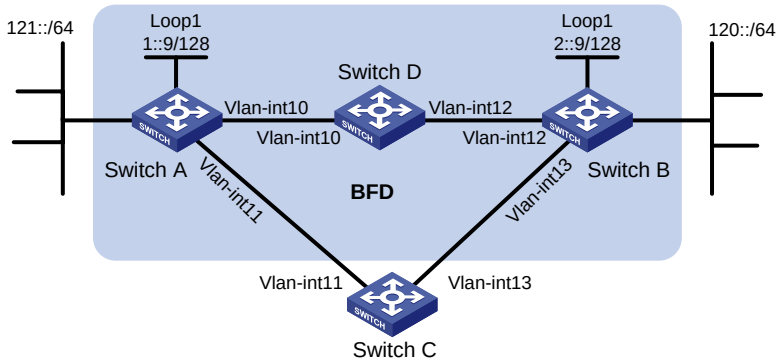

Table 2 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch A	Loop1	1::9/128
Switch B	Vlan-int12	11::2/64
Switch B	Vlan-int13	13::1/64
Switch B	Loop1	2::9/128
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64
Switch D	Vlan-int10	12::2/64

Device	Interface	IPv6 address
Switch D	Vlan-int12	11::1/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the IPv6 static route that traverses Switch D.

```
<SwitchA> system-view
[SwitchA] bfd multi-hop min-transmit-interval 500
[SwitchA] bfd multi-hop min-receive-interval 500
[SwitchA] bfd multi-hop detect-multiplier 9
[SwitchA] ipv6 route-static 120:: 64 2::9 bfd control-packet bfd-source 1::9
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] ipv6 route-static 2::9 128 12::2
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses Switch D.

```
<SwitchB> system-view
[SwitchB] bfd multi-hop min-transmit-interval 500
[SwitchB] bfd multi-hop min-receive-interval 500
[SwitchB] bfd multi-hop detect-multiplier 9
[SwitchB] ipv6 route-static 121:: 64 1::9 bfd control-packet bfd-source 2::9
[SwitchB] ipv6 route-static 121:: 64 13::2 preference 65
[SwitchB] ipv6 route-static 1::9 128 11::1
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

   # Configure IPv6 static routes on Switch D.

```
<SwitchD> system-view
[SwitchD] ipv6 route-static 120:: 64 11::2
[SwitchD] ipv6 route-static 121:: 64 12::1
[SwitchD] ipv6 route-static 2::9 128 11::2
[SwitchD] ipv6 route-static 1::9 128 12::1
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv6 session working in control packet mode:

      Local Discr: 513                Remote Discr: 33
        Source IP: 1::9
   Destination IP: 2::9
    Session State: Up                     Interface: N/A
```

```
        Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display the IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                Protocol  : Static
NextHop    : 2::9                                    Preference: 60
Interface  : Vlan10                                  Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

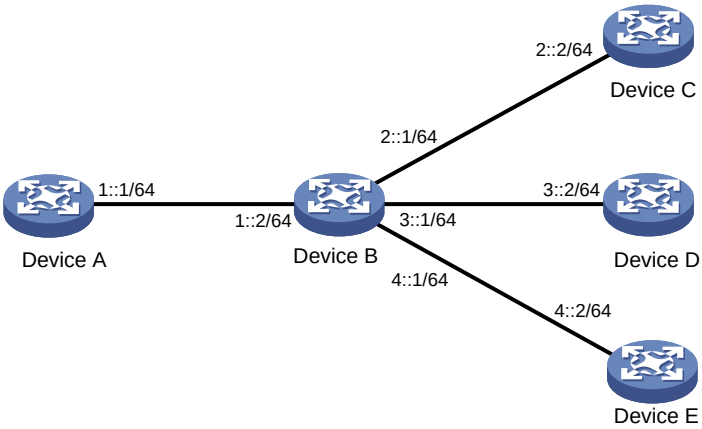
Destination: 120::/64                                Protocol  : Static
NextHop    : 10::100                                 Preference: 65
Interface  : Vlan11                                  Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Configuring an IPv6 default route

A default IPv6 route is used to forward packets that match no entry in the routing table.



A default IPv6 route can be configured in either of the following ways:

- The network administrator can configure a default route with a destination prefix of **::/0**. For more information, see "Configuring IPv6 static routing."
- Some dynamic routing protocols (such as OSPFv3, IPv6 IS-IS, and RIPng) can generate a default IPv6 route. For example, an upstream router running OSPFv3 can generate a default IPv6 route and advertise it to other routers. These routers install the default IPv6 route with the next hop being the upstream router. For more information, see the respective chapters on those routing protocols in this configuration guide.

As shown in Figure 4, Device B is the next hop for packets from Device A to Device C, Device D, and Device E. You can configure a default route on Device A to replace the three IPv6 static routes from Device A to Device C, Device D, and Device E, respectively.

The next hop address, destination address, and subnet mask of the IPv6 default route configured on Device A are 1::2, ::, and 0, respectively.

Configuring RIPng

About RIPng

RIP next generation (RIPng), as an extension of RIP-2 for support of IPv6, is a distance vector routing protocol. It employs UDP to exchange route information through port 521. Most RIP concepts are applicable to RIPng.

RIPng routing metrics

RIPng uses a hop count to measure the distance to a destination. The hop count is the metric or cost. The hop count from a router to a directly connected network is 0. The hop count between two directly connected routers is 1. When the hop count is greater than or equal to 16, the destination network or host is unreachable.

RIPng route entries

RIPng stores route entries in a database. Each route entry contains the following elements:

- **Destination address**—IPv6 address of a destination host or a network.
- **Next hop address**—IPv6 address of the next hop.
- **Egress interface**—Egress interface of the route.
- **Metric**—Cost from the local router to the destination.
- **Route time**—Time elapsed since the most recent update. The time is reset to 0 every time the route entry is updated.
- **Route tag**—Used for route control. For more information, see "Configuring routing policies."

RIPng packets and advertisement

RIPng multicasts request and response packets to exchange routing information. It uses FF02::9 as the destination address and link-local address FE80::/10 as the source address. RIPng exchanges routing information as follows:

1. When RIPng starts or needs to update some route entries, it sends a multicast request packet to neighbors.
2. When a RIPng neighbor receives the request packet, it sends back a response packet that contains the local routing table. RIPng can also advertise route updates in response packets periodically or advertise a triggered update caused by a route change.
3. After RIPng receives the response, it checks the validity of the response before adding routes to its routing table, including the following details:
   - Whether the source IPv6 address is the link-local address.
   - Whether the port number is correct.
4. A response packet that fails the check is discarded.

Protocols and standards

- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*

RIPng tasks at a glance

To configure RIPng, perform the following tasks:

1. Configuring basic RIPng
   a. Enabling RIPng
   b. Suppressing an interface
2. (Optional.) Configuring RIPng route control
   - Configuring an additional routing metric
   - Configuring RIPng route summarization
   - Advertising a default route
   - Configuring received/redistributed route filtering
   - Setting a preference for RIPng
   - Configuring RIPng route redistribution
3. (Optional.) Tuning and optimizing the RIPng network
   - Setting RIPng timers
   - Configuring split horizon and poison reverse
   - Configuring the RIPng packet sending rate
   - Setting the interval for sending triggered updates
4. (Optional.) Enhancing RIPng availability
   - Configuring RIPng GR
   - Configuring RIPng NSR
   - Configuring BFD for RIPng
5. (Optional.) Enhancing RIPng security
   - Configuring zero field check for RIPng packets
   - Applying an IPsec profile

Configuring basic RIPng

Enabling RIPng

1. Enter system view.
   system-view
2. Enable RIPng and enter its view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
   By default, RIPng is disabled.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on the interface.
   If RIPng is not enabled on an interface, the interface does not send or receive any RIPng route.

Suppressing an interface

About this task

Perform this task to disable interfaces from sending RIPng messages. The interfaces can still receive RIPng messages.

Procedure

1. Enter system view.

   system-view
2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Suppress an interface.

   silent-interface { *interface-type interface-number* | **all** }

   By default, all RIPng-enabled interfaces can send RIP messages.

   The suppressed interface can still receive RIP messages and respond to unicast requests containing unknown ports.

Configuring RIPng route control

Configuring an additional routing metric

About this task

An additional routing metric (hop count) can be added to the metric of an inbound or outbound RIPng route.

- An outbound additional metric is added to the metric of a sent route, and it does not change the route's metric in the routing table.
- An inbound additional metric is added to the metric of a received route before the route is added into the routing table, and the route's metric is changed.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify an inbound additional routing metric.

   ripng metricin *value*

   The default additional metric of an inbound route is 0.
4. Specify an outbound additional routing metric.

   ripng metricout *value*

   The default additional metric of an outbound route is 1.

Configuring RIPng route summarization

About this task

RIPng route summarization is interface-based. RIPng advertises a summary route based on the longest match.

RIPng route summarization improves network scalability, reduces routing table size, and increases routing table lookup efficiency.

RIPng advertises a summary route with the smallest metric of all the specific routes.

For example, RIPng has two specific routes to be advertised through an interface: 1:11:11::24 with a metric of a 2 and 1:11:12::34 with a metric of 3. Configure route summarization on the interface, so RIPng advertises a single route 11::0/16 with a metric of 2.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Advertise a summary IPv6 prefix.

   ripng summary-address *ipv6-address prefix-length*

   By default, no summary IPv6 prefix is configured on the interface.

Advertising a default route

About this task

You can configure RIPng to advertise a default route with the specified cost to its neighbors.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure RIPng to advertise a default route.

   ripng default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not advertise a default route.

   This command advertises a default route on the current interface regardless of whether the default route exists in the local IPv6 routing table.

Configuring received/redistributed route filtering

About this task

Perform this task to filter received or redistributed routes by using an IPv6 ACL, IPv6 prefix list, or routing policy. You can also configure RIPng to filter routes redistributed from other routing protocols and routes from a specified neighbor.

Procedure

1. Enter system view.

   system-view
2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Configure a filter policy to filter received routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

By default, RIPng does not filter received routes.

4. Configure a filter policy to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **export** [*protocol* [*process-id*]]

   By default, RIPng does not filter redistributed routes.

Setting a preference for RIPng

About this task

Routing protocols each have a preference. When they find routes to the same destination, the route found by the routing protocol with the highest preference is selected as the optimal route. You can manually set a preference for RIPng. The smaller the value, the higher the preference.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set a preference for RIPng.

   preference { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of RIPng is 100.

Configuring RIPng route redistribution

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configure route redistribution.

   - Redistribute direct or static routes.

     import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   - Redistribute routes from OSPFv3 or other RIPng processes.

     import-route { **ospfv3** | **ripng** } [*process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not redistribute routes.

4. (Optional.) Set a default routing metric for redistributed routes.

   default cost *cost-value*

   The default metric of redistributed routes is 0.

Tuning and optimizing the RIPng network

Setting RIPng timers

About this task

You can adjust RIPng timers to optimize the performance of the RIPng network.

Restrictions and guidelines

When you adjust RIPng timers, consider the network performance, and perform unified configurations on routers running RIPng to avoid unnecessary network traffic or route oscillation.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set RIPng timers.
   timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *
   The default settings are as follows:
   - The update timer is 30 seconds.
   - The timeout timer is 180 seconds.
   - The suppress timer is 120 seconds.
   - The garbage-collect timer is 120 seconds.

Configuring split horizon and poison reverse

Restrictions and guidelines for split horizon and poison reverse

When you configure split horizon and poison reverse, following these restrictions and guidelines:

- If both split horizon and poison reverse are configured, only the poison reverse feature takes effect.
- Split horizon disables RIPng from sending routes through the interface where the routes were learned to prevent routing loops between neighbors. As a best practice, enable split horizon to prevent routing loops in normal cases.
- Poison reverse enables a route learned from an interface to be advertised through the interface. However, the metric of the route is set to 16, which means the route is unreachable.

Configuring split horizon

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable split horizon.
   ripng split-horizon
   By default, split horizon is enabled.

Configuring poison reverse

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable poison reverse.
   ripng poison-reverse
   By default, poison reverse is disabled.

Configuring the RIPng packet sending rate

About this task

Perform this task to specify the interval for sending RIPng packets and the maximum number of RIPng packets that can be sent at each interval. This feature can avoid excessive RIPng packets from affecting system performance and consuming too much bandwidth.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configuring the RIPng packet sending rate.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in RIPng view:

     ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

     output-delay *time* **count** *count*

     By default, an interface that runs the RIPng process sends a maximum of three RIPng packets every 20 milliseconds.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in interface view:

     interface *interface-type interface-number*

     ripng output-delay *time* **count** *count*

     By default, an interface uses the RIPng packet sending rate of the RIPng process that it runs.

Setting the interval for sending triggered updates

About this task

Perform this task to avoid network overhead and reduce system resource consumption caused by frequent RIPng triggered updates.

You can use the **timer triggered** command to set the maximum interval, minimum interval, and incremental interval for sending RIPng triggered updates.

For a stable network, the minimum interval is used. If network changes become frequent, the triggered update sending interval is incremented by the incremental interval × 2^{n-2} for each triggered update until the maximum interval is reached. The value *n* is the number of triggered update times.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set the interval for sending triggered updates.

   timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   The default maximum interval is 5 seconds, the default minimum interval is 50 milliseconds, and the default incremental interval is 200 milliseconds.

Configuring RIPng GR

About this task

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

After RIPng restarts on a router, the router must learn RIPng routes again and updates its FIB table, which causes network disconnections and route reconvergence.

With the GR feature, the restarting router (known as the GR restarter) can notify the event to its GR capable neighbors. GR capable neighbors (known as GR helpers) maintain their adjacencies with the router within a configurable GR interval. During this process, the FIB table of the router does not change. After the restart, the router contacts its neighbors to retrieve its FIB.

By default, a RIPng-enabled device acts as the GR helper. Perform this task on the GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enable RIPng and enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable the GR capability for RIPng.
   graceful-restart
   By default, RIPng GR is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   The default GR interval is 60 seconds.

Configuring RIPng NSR

About this task

Nonstop routing (NSR) backs up RIPng routing information from the active process to the standby process. After an active/standby switchover, NSR can complete route regeneration without tearing down adjacencies or impacting forwarding services.

To use RIPng NSR, the system must have a minimum of two IRF member devices. NSR ensures nonstop services when RIPng has redundant processes on multiple IRF member devices.

In contrast to GR, NSR does not require a neighbor device to recover routing information.

Restrictions and guidelines

When both GR and NSR are configured for RIPng, the following rules apply:

- NSR has a higher priority than GR. When the active RIPng process goes down, the device does not act as the GR restarter and performs RIPng NSR to ensure nonstop forwarding.
- The device can participate in a GR process only when it acts as the GR helper. If it performs an active/standby RIPng process switchover before the GR process finishes, the GR process might fail even if RIPng NSR is enabled on the device.

RIPng NSR enabled for a RIPng process takes effect only on that process. As a best practice, enable RIPng NSR for each process if multiple RIPng processes exist.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable RIPng NSR.
   non-stop-routing
   By default, RIPng NSR is disabled.

Configuring BFD for RIPng

About this task

RIPng detects route failures by periodically sending requests. If it receives no response for a route within a certain time, RIPng considers the route unreachable. To speed up convergence, perform this task to enable BFD for RIPng. For more information about BFD, see *High Availability Configuration Guide*.

RIPng supports BFD in control packet mode. In this mode, a BFD session is established only when both ends have routes to send and BFD is enabled on the receiving interface.

Restrictions and guidelines

You need to perform this task to configure control-mode BFD detection on both the local and peer ends.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD for RIPng.
   ripng bfd enable
   By default, BFD for RIPng is disabled.

Enhancing RIPng security

Configuring zero field check for RIPng packets

About this task

Some fields in the RIPng packet header must be zero. These fields are called zero fields. You can enable zero field check for incoming RIPng packets. If a zero field of a packet contains a non-zero value, RIPng does not process the packets. If you are certain that all packets are trustworthy, disable the zero field check to save CPU resources.

Procedure

1. Enter system view.
   system-view

2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable the zero field check for incoming RIPng packets.
   checkzero
   By default, zero field check for incoming RIPng packets is enabled.

Applying an IPsec profile

About this task

To protect routing information and prevent attacks, you can configure RIPng to authenticate protocol packets by using an IPsec profile.

An IPsec profile contains inbound and outbound security parameter indexes (SPIs). RIPng compares the inbound SPI defined in the IPsec profile with the outbound SPI in the received packets. Two RIPng devices accept the packets from each other and establish a neighbor relationship only if the SPIs are the same and the relevant IPsec profiles match.

For more information about IPsec profiles, see *Security Configuration Guide*.

Restrictions and guidelines

You can apply an IPsec profile to a RIPng process or to an interface. If an interface and its process each have an IPsec profile, the IPsec profile applied to the interface takes effect.

Applying an IPsec profile to a process

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Apply an IPsec profile to the process.
   enable ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

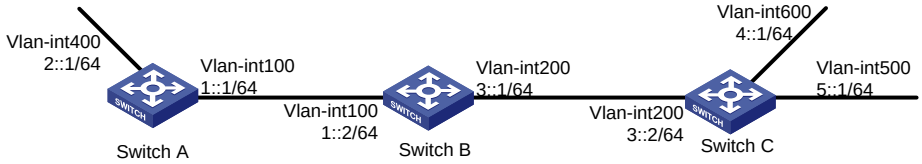
1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ripng ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Display and maintenance commands for RIPng

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information for a RIPng process.	**display ripng** [*process-id*]
Display RIPng GR information.	**display ripng** [*process-id*]

Task	Command
	graceful-restart
Display RIPng NSR information.	**display ripng** [*process-id*] **non-stop-routing**
Display routes in the RIPng database.	**display ripng** *process-id* **database** [*ipv6-address prefix-length*]
Display interface information for a RIPng process.	**display ripng** *process-id* **interface** [*interface-type interface-number*]
Display neighbor information for a RIPng process.	**display ripng** *process-id* **neighbor** [*interface-type interface-number*]
Display the routing information for a RIPng process.	**display ripng** *process-id* **route** [*ipv6-address prefix-length* [**verbose**] | **peer** *ipv6-address* | **statistics**]
Restart a RIPng process.	**reset ripng** *process-id* **process**
Clear statistics for a RIPng process.	**reset ripng** *process-id* **statistics**



RIPng configuration examples

Example: Configuring basic RIPng

Network configuration

As shown in Figure 1, Switch A, Switch B, and Switch C run RIPng. Configure route filtering on Switch B to accept all received routes except the route 2::/64 and to advertise only the route 4::/64.

Figure 1 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ripng 1
   [SwitchA-ripng-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ripng 1 enable
   [SwitchA-Vlan-interface100] quit
   [SwitchA] interface vlan-interface 400
   [SwitchA-Vlan-interface400] ripng 1 enable
   [SwitchA-Vlan-interface400] quit
   ```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 500
[SwitchC-Vlan-interface500] ripng 1 enable
[SwitchC-Vlan-interface500] quit
[SwitchC] interface vlan-interface 600
[SwitchC-Vlan-interface600] ripng 1 enable
[SwitchC-Vlan-interface600] quit
```

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::20F:E2FF:FE23:82F5 on Vlan-interface100
 Destination 2::/64,
     via FE80::20F:E2FF:FE23:82F5, cost 1, tag 0, AOF, 6 secs
 Peer FE80::20F:E2FF:FE00:100  on Vlan-interface200
 Destination 4::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
```

Display the RIPng routing table on Switch A.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::200:2FF:FE64:8904 on Vlan-interface100
```

```
 Destination 3::/64,
     via FE80::200:2FF:FE64:8904, cost 1, tag 0, AOF, 31 secs
 Destination 4::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Destination 5::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Local route
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
```

3. Configure route filtering:

Use IPv6 prefix lists on Switch B to filter received and redistributed routes.

```
[SwitchB] ipv6 prefix-list aaa permit 4:: 64
[SwitchB] ipv6 prefix-list bbb deny 2:: 64
[SwitchB] ipv6 prefix-list bbb permit :: 0 less-equal 128
[SwitchB] ripng 1
[SwitchB-ripng-1] filter-policy prefix-list aaa export
[SwitchB-ripng-1] filter-policy prefix-list bbb import
[SwitchB-ripng-1] quit
```

Display RIPng routing tables on Switch B and Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::1:100 on Vlan-interface100

 Peer FE80::3:200 on Vlan-interface200
 Destination 4::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF

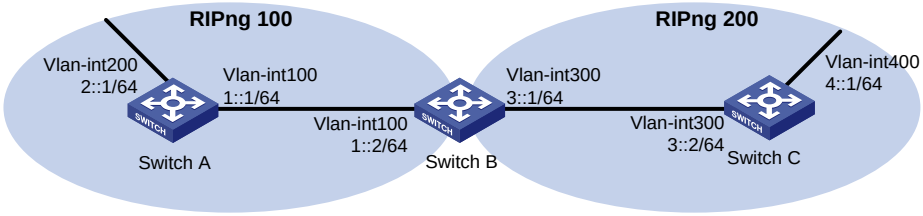
     via ::, cost 0, tag 0, DOF
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::2:100 on Vlan-interface100
 Destination 4::/64,
     via FE80::1:100, cost 2, tag 0, AOF, 2 secs
 Local route
 Destination 1::/64,
```

```
    via ::, cost 0, tag 0, DOF
Destination 2::/64,
    via ::, cost 0, tag 0, DOF
```



Example: Configuring RIPng route redistribution

Network configuration

As shown in Figure 2, Switch B communicates with Switch A through RIPng 100 and with Switch C through RIPng 200.

Configure route redistribution on Switch B, so the two RIPng processes can redistribute routes from each other.

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Enable RIPng 100 on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 100
[SwitchA-ripng-100] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 100 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ripng 100 enable
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng 100 and RIPng 200 on Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 100
[SwitchB-ripng-100] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 100 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] ripng 200
[SwitchB-ripng-200] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ripng 200 enable
[SwitchB-Vlan-interface300] quit
```

   # Enable RIPng 200 on Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 200
```

```
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ripng 200 enable
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ripng 200 enable
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch A.

```
[SwitchA] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: ::1/128                                Protocol  : Direct

```

Example: Configuring RIPng GR

Network configuration

As shown in Figure 3, Switch A, Switch B, and Switch C learn IPv6 routing information through RIPng.

Configure Switch A as the GR restarter. Configure Switch B and Switch C as the GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 3 Network diagram

Procedure

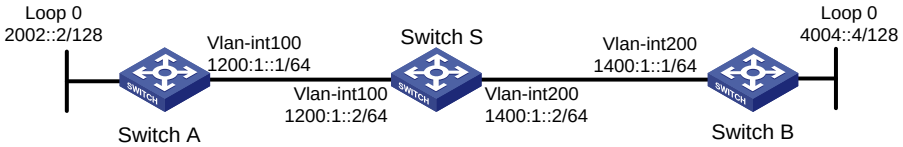
1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng GR on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] graceful-restart
```

Verifying the configuration

Restart RIPng or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display ripng 1 graceful-restart
RIPng process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time: 0   seconds
```



Example: Configuring RIPng NSR

Network configuration

As shown in Figure 4, Switch S, Switch A, and Switch B learn IPv6 routing information through RIPng.

Enable RIPng NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 4 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)

2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng NSR.

   # Enable RIPng NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ripng 1
[SwitchS-ripng-1] non-stop-routing
[SwitchS-ripng-1] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

```

During the switchover period, display RIPng neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
[SwitchA] display ripng 1 neighbor
 Neighbor Address: FE80::AE45:5CE7:422E:2867
     Interface  : Vlan-interface100
     Version    : RIPng version 1     Last update: 00h00m23s
     BFD session: None
     Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch A to verify if Switch A has a route to the loopback interface on Switch B.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::AE45:5CE7:422E:2867 on Vlan-interface100
 Destination 1400:1::/64,
     via FE80::AE45:5CE7:422E:2867, cost 1, tag 0, AOF, 1 secs
 Destination 4004::4/128,
```

```
    via FE80::AE45:5CE7:422E:2867, cost 2, tag 0, AOF, 1 secs
 Local route
 Destination 2002::2/128,
    via ::, cost 0, tag 0, DOF
 Destination 1200:1::/64,
    via ::, cost 0, tag 0, DOF
```

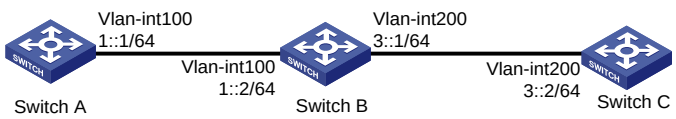
Display RIPng neighbors on Switch B to verify the neighbor relationship between Switch B and Switch S.

```
[SwitchB] display ripng 1 neighbor
 Neighbor Address: FE80::20C:29FF:FECE:6277
    Interface  : Vlan-interface200
    Version    : RIPng version 1     Last update: 00h00m18s
    BFD session: None
    Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch B to verify if Switch B has a route to the loopback interface on Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::20C:29FF:FECE:6277 on Vlan-interface200
 Destination 2002::2/128,
    via FE80::20C:29FF:FECE:6277, cost 2, tag 0, AOF, 24 secs
 Destination 1200:1::/64,
    via FE80::20C:29FF:FECE:6277, cost 1, tag 0, AOF, 24 secs
 Local route
 Destination 4004::4/128,
    via ::, cost 0, tag 0, DOF
 Destination 1400:1::/64,
    via ::, cost 0, tag 0, DOF
```

The output shows the following when an active/standby switchover occurs on Switch S:



- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring RIPng IPsec profile

Network configuration

As shown in Figure 5, configure RIPng on the switches, and configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
```

3. Configure RIPng IPsec profiles:
   - On Switch A:

     # Create an IPsec transform set named **protrf1**.

```
[SwitchA] ipsec transform-set protrf1
```

     # Specify the ESP encryption and authentication algorithms.

```
[SwitchA-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
[SwitchA-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```

     # Specify transport mode for encapsulation.

```
 [SwitchA-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchA-ipsec-transform-set-protrf1] quit
```

     # Create a manual IPsec profile named **profile001**.

```
[SwitchA] ipsec profile profile001 manual
```

     # Reference IPsec transform set **protrf1**.

```
[SwitchA-ipsec-profile-profile001-manual] transform-set protrf1
```

     # Configure the inbound and outbound SPIs for ESP.

```
[SwitchA-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchA-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

     # Configure the inbound and outbound SA keys for ESP.

```
[SwitchA-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchA-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
```

```
[SwitchA-ipsec-profile-profile001-manual] quit
```

- On Switch B:

  # Create an IPsec transform set named **protrf1**.

```
[SwitchB] ipsec transform-set protrf1
```

  # Specify the ESP encryption and authentication algorithms.

```
[SwitchB-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
[SwitchB-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```

  # Specify transport mode for encapsulation.

```
 [SwitchB-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchB-ipsec-transform-set-protrf1] quit
```

  # Create a manual IPsec profile named **profile001**.

```
[SwitchB] ipsec profile profile001 manual
```

  # Reference IPsec transform set **protrf1**.

```
[SwitchB-ipsec-profile-profile001-manual] transform-set protrf1
```

  # Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchB-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

  # Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] quit
```

- On Switch C:

  # Create an IPsec transform set named **protrf1**.

```
[SwitchC] ipsec transform-set protrf1
```

  # Specify the ESP encryption and authentication algorithms.

```
[SwitchC-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
[SwitchC-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```

  # Specify transport mode for encapsulation.

```
 [SwitchC-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchC-ipsec-transform-set-protrf1] quit
```

  # Create a manual IPsec profile named **profile001**.

```
[SwitchC] ipsec profile profile001 manual
```

  # Reference IPsec transform set **protrf1**.

```
[SwitchC-ipsec-profile-profile001-manual] transform-set protrf1
```

  # Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchC-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

  # Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] quit
```

4. Apply the IPsec profiles to the RIPng process on each device:

- On Switch A:

```
[SwitchA] ripng 1
[SwitchA-ripng-1] enable ipsec-profile profile001
[SwitchA-ripng-1] quit
```

- On Switch B:

```
[SwitchB] ripng 1
[SwitchB-ripng-1] enable ipsec-profile profile001
[SwitchB-ripng-1] quit
```

- On Switch C:

```
[SwitchC] ripng 1
[SwitchC-ripng-1] enable ipsec-profile profile001
[SwitchC-ripng-1] quit
```

Verifying the configuration

Verify that the RIPng packets between Switches A, B and C are protected by IPsec. (Details not shown.)

Configuring OSPFv3

About OSPFv3

This chapter describes how to configure Open Shortest Path First version 3 (OSPFv3) for an IPv6 network.

Comparison of OSPFv3 with OSPFv2

OSPFv3 and OSPFv2 have the following in common:

- 32-bit router ID and area ID.
- Hello, Database Description (DD), Link State Request (LSR), Link State Update (LSU), Link State Acknowledgment (LSAck).
- Mechanisms for finding neighbors and establishing adjacencies.
- Mechanisms for advertising and aging LSAs.

OSPFv3 and OSPFv2 have the following differences:

- OSPFv3 runs on a per-link basis and uses link-local addresses for neighbor relationship establishment and LSA database synchronization. All OSPFv3 interfaces use their link-local addresses to forward packets except for virtual links.
- OSPFv3 supports running multiple processes on an interface, but OSPFv2 does not support.
- OSPFv3 identifies neighbors by router ID. OSPFv2 identifies neighbors by IP address.

For more information about OSPFv2, see "Configuring OSPF."

OSPFv3 packets

OSPFv3 uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **DD**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **LSR**—Requests needed LSAs from the neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then send an LSR packet to each other, requesting the missing LSAs. The LSA packet contains the digest of the missing LSAs.
- **LSU**—Transmits the requested LSAs to the neighbor.
- **LSAck**—Acknowledges received LSU packets.

OSPFv3 LSA types

OSPFv3 sends routing information in LSAs. The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers. This LSA describes the collected states of the router's interfaces to an area, and is flooded throughout a single area only.
- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the DR. This LSA contains the list of routers connected to the network, and is flooded throughout a single area only.

- **Inter-Area-Prefix LSA**—Type-3 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Prefix LSA describes a route with IPv6 address prefix to a destination outside the area, yet still inside the AS.
- **Inter-Area-Router LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Router LSA describes a route to ASBR.
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS, except stub areas and Not-So-Stubby Areas (NSSAs). Each AS External LSA describes a route to another AS. A default route can be described by an AS External LSA.
- **NSSA LSA**—Type-7 LSA, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Link LSA**—Type-8 LSA. A router originates a separate Link LSA for each attached link. Link LSAs have link-local flooding scope. Each Link LSA describes the IPv6 address prefix of the link and Link-local address of the router.
- **Intra-Area-Prefix LSA**—Type-9 LSA. Each Intra-Area-Prefix LSA contains IPv6 prefix information on a router, stub area, or transit area information, and has area flooding scope. It was introduced because Router LSAs and Network LSAs contain no address information.
- **Grace LSA**—Type-11 LSA, generated by a GR restarter at reboot and transmitted on the local link. The GR restarter describes the cause and interval of the reboot in the Grace LSA to notify its neighbors that it performs a GR operation.

Protocols and standards

- RFC 2328, *OSPF Version 2*
- RFC 3101, *OSPF Not-So-Stubby Area (NSSA) Option*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 5187, *OSPFv3 Graceful Restart*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5329, *Traffic Engineering Extensions to OSPF Version 3*
- RFC 5340, *OSPF for IPv6*
- RFC 5523, *OSPFv3-Based Layer 1 VPN Auto-Discovery*
- RFC 5643, *Management Information Base for OSPFv3*
- RFC 6506, *Supporting Authentication Trailer for OSPFv3*
- RFC 6565, *OSPFv3 as a Provider Edge to Customer Edge (PE-CE) Routing Protocol*
- RFC 6969, *OSPFv3 Instance ID Registry Update*
- RFC 7166, *Supporting Authentication Trailer for OSPFv3*

OSPFv3 tasks at a glance

To configure OSPFv3, perform the following tasks:

1. Enabling OSPFv3
2. (Optional.) Configuring OSPFv3 area parameters
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring an OSPFv3 virtual link

     Perform this task on an ABR to create a virtual link when connectivity cannot be maintained between a non-backbone area and the backbone, or within the backbone.
3. (Optional.) Configuring OSPFv3 network types

- Setting the broadcast network type for an OSPFv3 interface
- Setting the NBMA network type for an OSPFv3 interface
- Setting the P2MP network type for an OSPFv3 interface
- Setting the P2P network type for an OSPFv3 interface

4. (Optional.) Configuring OSPFv3 route control
   - Configuring OSPFv3 received route filtering
   - Configuring Inter-Area-Prefix LSA filtering
   - Setting an OSPFv3 cost for an interface
   - Advertising the maximum link cost to neighbors within the specified period
   - Associating OSPFv3 with Track
   - Setting a preference for OSPFv3
   - Configuring OSPFv3 route redistribution
5. (Optional.) Setting OSPFv3 timers
   - Setting OSPFv3 packet timers
   - Setting the LSA transmission delay
   - Setting the OSPFv3 route calculation interval
   - Setting the LSA generation interval
   - Setting the LSU transmit rate
6. (Optional.) Setting a DR priority for an interface
7. (Optional.) Configuring OSPFv3 packet parameters
   - Ignoring MTU check for DD packets
   - Disabling interfaces from receiving and sending OSPFv3 packets
8. (Optional.) Configuring prefix suppression
9. (Optional.) Configuring OSPFv3 advanced features
   - Configuring a stub router
   - Configuring OSPFv3 isolation
   - Configuring OSPFv3 shutdown
10. (Optional.) Enhancing OSPFv3 availability
    - Configuring OSPFv3 GR
    - Configuring OSPFv3 NSR
    - Configuring BFD for OSPFv3
11. (Optional.) Enhancing OSPFv3 security
    - Configuring OSPFv3 authentication
    - Applying an IPsec profile for authenticating OSPFv3 packets
12. (Optional.) Configuring OSPFv3 logging and SNMP notifications
    - Enabling logging for neighbor state changes
    - Setting the maximum number of OSPFv3 logs
    - Configuring OSPFv3 network management

Enabling OSPFv3

About this task

To enable an OSPFv3 process on a router:

1. Enable the OSPFv3 process globally.

2. Assign the OSPFv3 process a router ID.
3. Enable the OSPFv3 process on related interfaces.

An OSPFv3 process ID has only local significance. Process 1 on a router can exchange packets with process 2 on another router.

OSPFv3 requires you to manually specify a router ID for each router in an AS. Make sure all assigned router IDs in the AS are unique.

Restrictions and guidelines

If a router runs multiple OSPFv3 processes, you must specify a unique router ID for each process.

Procedure

1. Enter system view.
   system-view
2. Enable an OSPFv3 process and enter its view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
   By default, no OSPFv3 processes are enabled.
3. Specify a router ID.
   router-id *router-id*
   By default, no router ID is configured.
4. (Optional.) Configure a description for the OSPFv3 process.
   description *text*
   By default, no description is configured for an OSPFv3 process.
   To identify and manage different OSPFv3 processes, configure a unique description for each process.
5. Return to system view.
   quit
6. Enter interface view.
   interface *interface-type interface-number*
7. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, no OSPFv3 processes are enabled on an interface.

Configuring OSPFv3 area parameters

About OSPFv3 areas

OSPFv3 has the same stub area, NSSA area, and virtual link features as OSPFv2.

After you split an OSPFv3 AS into multiple areas, the LSA number is reduced and OSPFv3 applications are extended. To further reduce the size of routing tables and the number of LSAs, configure the non-backbone areas at an AS edge as stub areas.

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPFv3 routing domain while retaining other stub area characteristics.

Non-backbone areas exchange routing information through the backbone area, so the backbone and non-backbone areas (including the backbone itself) must be fully meshed. If no connectivity can be achieved, configure virtual links.

Configuring a stub area

Restrictions and guidelines

To configure a stub area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no area is configured as a stub area.
   The **no-summary** keyword is only available on the ABR of a stub area. If you specify the **no-summary** keyword, the ABR only advertises a default route in an Inter-Area-Prefix LSA into the stub area.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.

Configuring an NSSA area

Restrictions and guidelines

To configure an NSSA area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as an NSSA area.
   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] * | **no-import-route** | **no-summary** | [**translate-always** | **translate-never**] | **suppress-fa** | **translator-stability-interval** *value*] *
   By default, no area is configured as an NSSA area.
   To configure a totally NSSA area, execute the **nssa no-summary** command on the ABR. The ABR of a totally NSSA area does not advertise inter-area routes into the area.
5. (Optional.) Set a cost for the default route advertised to the NSSA area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the NSSA area is 1.
   This command takes effect only on the ABR/ASBR of an NSSA or totally NSSA area.

Configuring an OSPFv3 virtual link

About this task

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

Both ends of a virtual link are ABRs that must be configured with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **keychain** *keychain-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *

Configuring OSPFv3 network types

Restrictions and guidelines for OSPFv3 network type configuration

Based on the link layer protocol, OSPFv3 classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

- If any routers in a broadcast network do not support multicasting, you can change the network type to NBMA.
- If only two routers running OSPFv3 exist on a network segment, you can change the network type to P2P to save costs.

Setting the broadcast network type for an OSPFv3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to broadcast for the OSPFv3 interface.
   ospfv3 network-type broadcast [**instance** *instance-id*]
   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

Setting the NBMA network type for an OSPFv3 interface

Restrictions and guidelines

For NBMA interfaces, you must specify the link-local IP addresses and DR priorities for their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to NBMA for the OSPFv3 interface.

   ospfv3 network-type nbma [**instance** *instance-id*]

   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

4. (Optional.) Set the router priority for the interface

   ospfv3 dr-priority *priority*

   By default, an interface has a router priority of 1.

   An interface's router priority determines its privilege in DR/BDR selection.

5. Specify an NBMA neighbor.

   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

   By default, no link-local address is specified for the neighbor interface.

Setting the P2MP network type for an OSPFv3 interface

Restrictions and guidelines

For P2MP interfaces (only when in unicast mode), you must specify the link-local IP addresses of their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to P2MP for the OSPFv3 interface.

   ospfv3 network-type p2mp [**unicast**] [**instance** *instance-id*]

   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

4. Specify a P2MP unicast neighbor.

   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

   By default, no link-local address is specified for the neighbor interface.

Setting the P2P network type for an OSPFv3 interface

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to P2P for the OSPFv3 interface.
   ospfv3 network-type p2p [**instance** *instance-id*]
   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

Configuring OSPFv3 route control

Configuring OSPFv3 inter-area route summarization

About this task

If contiguous network segments exist in an area, you can summarize them into one network segment on the ABR. The ABR will advertise only the summary route. Any LSA on the specified network segment will not be advertised, reducing the LSDB size in other areas.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure route summarization on the ABR.
   abr-summary *ipv6-address prefix-length* [**not-advertise**] [**cost** *cost-value*]
   By default, route summarization is not configured on an ABR.

Configuring OSPFv3 received route filtering

About this task

This task allows you to filter routes calculated by using received LSAs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 to filter routes calculated by using received LSAs.
   filter-policy { *ipv6-acl-number* [**gateway** *prefix-list-name*] | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **route-policy** *route-policy-name* } **import**
   By default, OSPFv3 accepts all routes calculated by using received LSAs.
   This command can only filter routes computed by OSPFv3. Only routes not filtered out can be added into the local routing table.

Configuring Inter-Area-Prefix LSA filtering

Restrictions and guidelines

The **filter** command takes effect only on ABRs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure OSPFv3 to filter Inter-Area-Prefix LSAs.
   filter { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }
   By default, OSPFv3 accepts all Inter-Area-Prefix LSAs.

Advertising the maximum link cost to neighbors within the specified period

About this task

On an OSPFv3 network, when a link recovers from failures or the state of an interface changes, OSPFv3 will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable OSPFv3 to advertise the maximum link cost (65535) to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, OSPFv3 advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the duration of the maximum link cost advertisement.
   ospfv3 peer hold-max-cost duration *timer* [**instance** *instance-id*]
   By default, OSPFv3 advertises the original link cost to neighbors during a route convergence.

Setting an OSPFv3 cost for an interface

About this task

You can set an OSPFv3 cost for an interface with one of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface, and OSPFv3 computes the cost automatically based on the bandwidth reference value by using the following formula:

  Interface OSPFv3 cost = Bandwidth reference value (100 Mbps) / Interface bandwidth (Mbps)

  - If the calculated cost is greater than 65535, the value of 65535 is used.

- If the calculated cost is smaller than 1, the value of 1 is used.

- If no cost is set for an interface, OSPFv3 automatically computes the cost for the interface.

Setting a cost in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set an OSPFv3 cost for the interface.
   ospfv3 cost *cost-value* [**instance** *instance-id*]
   By default, the OSPFv3 cost is 1 for a VLAN interface, is 0 for a loopback interface. The OSPFv3 cost is automatically computed according to the interface bandwidth for other interfaces.

Setting a bandwidth reference value

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a bandwidth reference value.
   bandwidth-reference *value*
   The default bandwidth reference value is 100 Mbps.

Associating OSPFv3 with Track

About this task

Perform this task to associate an OSPFv3 interface with a track entry to adjust the cost of the interface as follows:

- When the track entry state becomes negative, OSPFv3 increases the cost of the interface.
- When the track entry state becomes positive, OSPFv3 restores the cost of the interface to the original value.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Associate the OSPFv3 interface with a track entry to adjust the cost of the interface based on the track entry state.
   ospfv3 track *track-entry-number* **adjust-cost** { *cost-offset* | **max** }
   By default, an OSPFv3 interface is not associated with any track entry.

Setting a preference for OSPFv3

About this task

A router can run multiple routing protocols. The system assigns a priority for each protocol. When these routing protocols find the same route, the route found by the protocol with the highest priority is selected.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a preference for OSPFv3.
   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *
   By default, the preference of OSPFv3 internal routes is 10, and the preference of OSPFv3 external routes is 150.

Configuring OSPFv3 route redistribution

Restrictions and guidelines

Because OSPFv3 is a link state routing protocol, it cannot directly filter LSAs to be advertised. OSPFv3 filters only redistributed routes. Only routes that are not filtered out can be advertised in LSAs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure route redistribution.
   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   By default, OSPFv3 does not redistribute routes.
4. (Optional.) Configure OSPFv3 to filter redistributed routes.
   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [**direct** | { **isisv6** | **ospfv3** | **ripng** } [*process-id*] | **static**]
   By default, OSPFv3 accepts all redistributed routes.
   This command filters only routes redistributed by the **import-route** command. If no routes are redistributed by the **import-route** command, this command does not take effect.
5. Set a tag for redistributed routes.
   default tag *tag*
   By default, the tag of redistributed routes is 1.

Configuring default route redistribution

About this task

The **import-route** command cannot redistribute a default external route. To redistribute a default route, perform this task.

Procedure

1. Enter system view.

system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no default route is redistributed.

4. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Setting OSPFv3 timers

Setting OSPFv3 packet timers

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospfv3 timer hello *seconds* [**instance** *instance-id*]

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the dead interval.

   ospfv3 timer dead *seconds* [**instance** *instance-id*]

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

   The dead interval set on neighboring interfaces cannot be too short. If the interval is too short, a neighbor is easily down.

5. Set the poll interval.

   ospfv3 timer poll *seconds* [**instance** *instance-id*]

   By default, the poll interval is 120 seconds.

6. Set the LSA retransmission interval.

   ospfv3 timer retransmit *interval* [**instance** *instance-id*]

   The default LSA retransmission interval is 5 seconds.

   The LSA retransmission interval cannot be too short. If the interval is too short, unnecessary retransmissions will occur.

Setting the LSA transmission delay

About this task

Each LSA in the LSDB has an age that increases by 1 every second, but the age does not change during transmission. Therefore, it is necessary to add a transmission delay into the age time, especially for low-speed links.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the LSA transmission delay.
   ospfv3 trans-delay *seconds* [**instance** *instance-id*]
   By default, the LSA transmission delay is 1 second.

Setting the OSPFv3 route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.
- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for subsequent route calculations is *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPFv3.
   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the LSA generation interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA generation interval settings for OSPFv3.

By default, the LSA generation interval is fixed at 5 seconds for OSPFv3.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The LSA generation interval is fixed at *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for subsequent LSA generations is *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA generation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Setting the LSU transmit rate

About this task

Sending large numbers of LSU packets affects router performance and consumes a large amount of network bandwidth. You can configure the router to send LSU packets at an interval and to limit the maximum number of LSU packets sent out of an OSPFv3 interface at each interval.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSU transmit rate.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPFv3 interface sends a maximum of three LSU packets every 20 milliseconds.

Setting a DR priority for an interface

About this task

The router priority is used for DR election. Interfaces having the priority 0 cannot become a DR or BDR.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set a router priority.

   ospfv3 dr-priority *priority* [**instance** *instance-id*]

   The default router priority is 1.

Configuring OSPFv3 packet parameters

Ignoring MTU check for DD packets

About this task

When LSAs are few in DD packets, it is unnecessary to check the MTU in DD packets to improve efficiency.

Restrictions and guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Ignore MTU check for DD packets.

   ospfv3 mtu-ignore [**instance** *instance-id*]

   By default, OSPFv3 does not ignore MTU check for DD packets.

Disabling interfaces from receiving and sending OSPFv3 packets

About this task

After an OSPFv3 interface is set to **silent**, direct routes of the interface can still be advertised in Intra-Area-Prefix LSAs through other interfaces, but other OSPFv3 packets cannot be advertised.

No neighboring relationship can be established on the interface. This feature can enhance the adaptability of OSPFv3 networking.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable interfaces from receiving and sending OSPFv3 packets.
   silent-interface { *interface-type interface-number* | **all** }
   By default, the interfaces can receive and send OSPFv3 packets.
   This command disables only the interfaces that run the current process. However, multiple OSPFv3 processes can disable the same interface from receiving and sending OSPFv3 packets.

Configuring prefix suppression

About prefix suppression

By default, an OSPFv3 interface advertises all of its prefixes in LSAs. To speed up OSPFv3 convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-8 LSAs.
- On broadcast and NBMA networks, the DR does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-2 LSAs.
- On P2P and P2MP networks, OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPFv3 routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPFv3 process

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable prefix suppression for the OSPFv3 process.
   prefix-suppression
   By default, prefix suppression is disabled for an OSPFv3 process.
   Enabling prefix suppression for an OSPFv3 process does not suppress the prefixes of loopback interfaces and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable prefix suppression for the interface.
   ospfv3 prefix-suppression [**disable**] [**instance** *instance-id*]
   By default, prefix suppression is disabled for an interface.

Configuring OSPFv3 advanced features

Configuring a stub router

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPFv3 routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Use either of the following methods to configure a router as a stub router:

- Clear the R-bit of the Option field in Type-1 LSAs. When the R-bit is clear, the OSPFv3 router can participate in OSPFv3 topology distribution without forwarding traffic.
- Use the OSPFv3 max-metric router LSA feature. This feature enables OSPFv3 to advertise its locally generated Type-1 LSAs with a maximum cost of 65535. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure the router as a stub router.
   - Configure the router as a stub router and clear the R-bit of the Option field in Type-1 LSAs.
     stub-router r-bit [**include-stub** | **on-startup** *seconds*] *
   - Configure the router as a stub router and advertise the locally generated Type-1 LSAs with the maximum cost of 65535.
     stub-router max-metric [**external-lsa** [*max-metric-value*] | **summary-lsa** [*max-metric-value*] | **include-stub** | **on-startup** *seconds*] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPFv3 isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPFv3 isolation works as follows:

1. After OSPFv3 isolation is enabled for a device, OSPFv3 increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is set to 65535.
   - The link cost in Type-9 LSAs (Intra-area-prefix LSAs) that reference Type-1 LSAs is set to 65535.
   - The link cost in the following LSAs is set to 16711680:
     - Type-3 LSAs (Inter-area-prefix LSAs).
     - Type-4 LSAs (Inter-area-router LSAs).
     - Type-5 LSAs (AS external LSAs).
     - Type-7 LSAs (NSSA LSAs).
2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPFv3 isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router max-metric external-lsa 16711680 summary-lsa 16711680 include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router max-metric** commands, follow these restrictions and guidelines:

- If you specify the **external-lsa** and **summary-lsa** keywords in the **stub-router max-metric** command, the higher one of the two link costs provided by the isolation feature and the stub router feature takes effect.
- If the **on-startup** keyword is specified in the **stub-router max-metric** command, traffic forwarding path selection is affected only by the isolation feature when the stub router feature does not take effect.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 isolation.
   - Enable OSPFv3 isolation to gracefully isolate the device from the network.

     isolate enable
   - Disable OSPFv3 isolation to gracefully add the device back to the network.

     undo isolate enable

   By default, OSPFv3 isolation is disabled.

Configuring OSPFv3 shutdown

About this task

For maintenance purposes, you can use this feature to shut down processes on the device with small impact on the network. If you shut down an OSPFv3 process, it will perform the following operations:

- Send 1-way hello packets to its neighbors.

  On receipt of the packets, the neighbors disconnect from the process and use the backup path to forward traffic.
- Stop receiving and sending OSPFv3 packets.
- Clear its neighbor, LSDB, and OSPFv3 route information.

After maintenance, you can use the **undo shutdown process** command to restart the process for neighbor relationship re-establishment.

This feature shuts down an OSPFv3 process while retaining the process-associated settings to facilitate your maintenance.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 shutdown for OSPFv3 maintenance.
   a. Shut down an OSPFv3 process to isolate it from the network.
      shutdown process
   b. Restart the OSPFv3 process to add it back to the network.
      undo shutdown process

   By default, the OSPFv3 process is not shut down.

Configuring OSPFv3 GR

About OSPFv3 GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must be Graceful Restart capable.
- **GR helper**—The neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

After the active/standby switchover, the GR restarter sends a Grace LSA to tell its neighbors that it performs a GR. Upon receiving the Grace LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Restrictions and guidelines for OSPFv3 GR

You cannot enable OSPFv3 NSR on a device that acts as GR restarter.

Configuring GR restarter

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR capability.
   graceful-restart enable [**global** | **planned-only**] *
   By default, OSPFv3 GR restarter capability is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring GR helper

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, the GR helper capability is enabled.
4. Enable strict LSA checking.
   graceful-restart helper strict-lsa-checking
   By default, strict LSA checking is disabled.

Triggering OSPFv3 GR

About this task

OSPFv3 GR is triggered by an active/standby switchover or when this task is performed.

Procedure

To trigger OSPFv3 GR, execute the **reset ospfv3** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPFv3 NSR

About this task

Nonstop routing (NSR) backs up OSPFv3 link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPFv3 NSR or OSPFv3 GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPFv3 NSR and OSPFv3 GR as follows:

- **Device requirements**—The active and standby processes of OSPFv3 must run on different IRF member devices. To run OSPFv3 NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPFv3 GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPFv3 GR when the IRF fabric contains only one member device. (Centralized IRF devices.)
- **OSPFv3 neighbor requirements**—When you use OSPFv3 NSR, OSPFv3 neighbors cannot detect process restart or active/standby switchover on the local device. OSPFv3 NSR can recover OSPFv3 route information without requiring the cooperation of OSPFv3 neighbors. OSPFv3 GR requires OSPFv3 neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

If OSPFv3 NSR and OSPFv3 GR are both configured on a device, they operate as follows:

- OSPFv3 NSR takes preference over OSPFv3 GR. That is, when the OSPFv3 active process fails, OSPFv3 NSR ensures service continuity. The device will not start the GR process as a GR restarter.
- After OSPFv3 starts the GR process, an active/standby process switchover might occur on the GR helper before it helps the GR restarter to complete state recovery. In this case, the GR process might fail even if OSPFv3 NSR is configured on the GR helper.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable OSPFv3 NSR.

   non-stop-routing

   By default, OSPFv3 NSR is disabled.

   This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

Configuring BFD for OSPFv3

About this task

Bidirectional forwarding detection (BFD) provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3. For more information about BFD, see *High Availability Configuration Guide*.

After discovering neighbors by sending hello packets, OSPFv3 notifies BFD of the neighbor addresses, and BFD uses these addresses to establish sessions. Before a BFD session is established, it is in the down state. In this state, BFD control packets are sent at an interval of no less than 1 second to reduce BFD control packet traffic. After the BFD session is established, BFD control packets are sent at the negotiated interval, thereby implementing fast fault detection.

To configure BFD for OSPFv3, you need to configure OSPFv3 first.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Specify a router ID.
   router-id *router-id*
4. Quit the OSPFv3 view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
7. Enable BFD on the interface.
   ospfv3 bfd enable [**instance** *instance-id*]
   By default, BFD is disabled on the OSPFv3 interface.

Enhancing OSPFv3 security

Configuring OSPFv3 authentication

About this task

OSPFv3 uses keychain authentication to prevent routing information from being leaked and routers from being attacked.

OSPFv3 adds the Authentication Trailer option into outgoing packets, and uses the authentication information in the option to authenticate incoming packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPFv3 neighbor relationship cannot be established.

Restrictions and guidelines

The authentication mode specified for an OSPFv3 interface has a higher priority than the mode specified for an OSPFv3 area.

OSPFv3 supports only the HMAC-SHA-256 authentication algorithm.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Configuring OSPFv3 area authentication

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Specify an authentication mode for the area.
   For HMAC-SHA-256 authentication:
   authentication-mode { **hmac-sha-256** } *key-id* { **cipher** | **plain** } *string*
   For keychain authentication:
   authentication-mode keychain *keychain-name*
   By default, no authentication is performed for the area.
   For more information about keychains, see *Security Configuration Guide*.

Configuring OSPFv3 interface authentication

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify an authentication mode for the interface.

   For HMAC-SHA-256 authentication:

   ospfv3 authentication-mode { **hmac-sha-256** } *key-id* { **cipher** | **plain** } *string* [**instance** *instance-id*]

   For keychain authentication:

   ospfv3 authentication-mode keychain *keychain-name* [**instance** *instance-id*]

   By default, no authentication is performed for the interface.

   For more information about keychains, see *Security Configuration Guide*.

Applying an IPsec profile for authenticating OSPFv3 packets

About this task

To protect routing information and prevent attacks, OSPFv3 can authenticate protocol packets by using an IPsec profile. For more information about IPsec profiles, see *Security Configuration Guide*.

Outbound OSPFv3 packets carry the Security Parameter Index (SPI) defined in the relevant IPsec profile. A device compares the SPI carried in a received packet with the configured IPsec profile. If they match, the device accepts the packet. Otherwise, the device discards the packet and will not establish a neighbor relationship with the sending device.

Restrictions and guidelines for applying an IPsec profile

You can configure an IPsec profile for an area, an interface, a virtual link, or a sham link.

- To implement area-based IPsec protection, configure the same IPsec profile on the routers in the target area.
- To implement interface-based IPsec protection, configure the same IPsec profile on the interfaces between two neighboring routers.
- To implement virtual link-based IPsec protection, configure the same IPsec profile on the two routers connected over the virtual link.
- If an interface and its area each have an IPsec profile configured, the interface uses its own IPsec profile.
- If a virtual link and area 0 each have an IPsec profile configured, the virtual link uses its own IPsec profile.
- If a sham link and its area have an IPsec profile configured, the sham link uses its own IPsec profile.

Applying an IPsec profile to an area

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to the area.

enable ipsec-profile *profile-name*

By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an IPsec profile to the interface.

   ospfv3 ipsec-profile *profile-name* [**instance** *instance-id*]

   By default, no IPsec profile is applied.

Applying an IPsec profile to a virtual link

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to a virtual link.

   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | { **hmac-sha-256** *key-id* { **cipher** | **plain** } *string* | **keychain** *keychain-name* } | **retransmit** *seconds* | **trans-delay** *seconds*] *

   By default, no IPsec profile is applied.

Applying an IPsec profile to a sham link

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to a sham link.

   sham-link *source-ipv6-address destination-ipv6-address* [**cost** *cost-value* | **dead** *dead-interval* | **hello** *hello-interval* | **instance** *instance-id* | **ipsec-profile** *profile-name* | { **hmac-sha-256** *key-id* { **cipher** | **plain** } *string* | **keychain** *keychain-name* } | **retransmit** *retrans-interval* | **trans-delay** *delay*] *

   By default, no IPsec profile is applied.

Configuring OSPFv3 logging and SNMP notifications

Enabling logging for neighbor state changes

About this task

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable logging for neighbor state changes.
   log-peer-change
   By default, this feature is enabled.

Setting the maximum number of OSPFv3 logs

About this task

OSPFv3 logs include route calculation logs, neighbor logs, and LSA aging logs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of OSPFv3 logs.
   event-log { **lsa-flush** | **peer** | **spf** } **size** *count*
   By default, the maximum number of LSA aging logs, neighbor logs, or route calculation logs is 10.

Configuring OSPFv3 network management

About this task

This task involves the following configurations:

- Bind an OSPFv3 process to MIB so that you can use network management software to manage the specified OSPFv3 process.
- Enable SNMP notifications for OSPFv3 to report important events.
- Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPFv3 events to an NMS, enable SNMP notifications for OSPFv3. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information

about SNMP configuration, see the network management and monitoring configuration guide for the device.

The standard OSPFv3 MIB provides only single-instance MIB objects. To identify multiple OSPFv3 processes in the standard OSPFv3 MIB, you must assign a unique context name to each OSPFv3 process.

Context is a method introduced to SNMPv3 for multiple-instance management. For SNMPv1/v2c, you must specify a community name as a context name for protocol identification.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPFv3 process.

   ospfv3 mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPFv3.

   snmp-agent trap enable ospfv3 [**grhelper-status-change** | **grrestarter-status-change** | **if-bad-pkt** | **if-cfg-error** | **if-state-change** | **intra-area-router-id-conflict** | **last-auth-key-expiry** | **neighbor-state-change** | **nssatranslator-status-change** | **virtgrhelper-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtneighbor-state-change**]*

   By default, SNMP notifications for OSPFv3 are enabled.

4. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

5. Configure an SNMP context for the OSPFv3 process.

   snmp context-name *context-name*

   By default, no SNMP context is configured for the OSPFv3 process.

6. (Optional.) Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPFv3 outputs a maximum of seven SNMP notifications within 10 seconds.

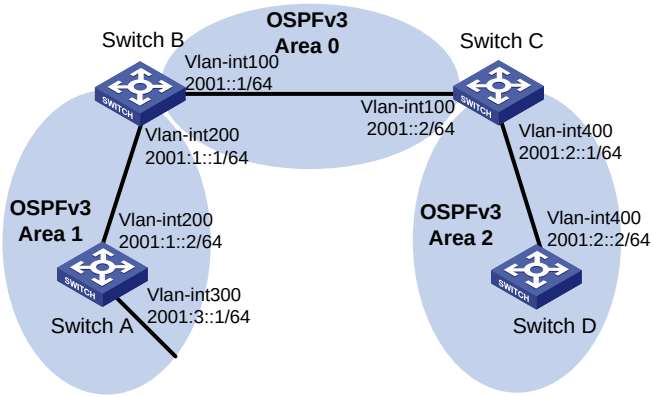
Display and maintenance commands for OSPFv3

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPFv3 ABR.	**display ospfv3** [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 neighbor information.	**display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]
Display OSPFv3 request list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]

Task	Command
Display OSPFv3 retransmission list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 topology information.	**display ospfv3** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPFv3 process information.	**display ospfv3** [*process-id*] [**verbose**]
Display information about the routes to OSPFv3 ABR and ASBR.	**display ospfv3** [*process-id*] **abr-asbr**
Display summary route information on the OSPFv3 ASBR.	**display ospfv3** [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 log information.	**display ospfv3** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPFv3 GR information.	**display ospfv3** [*process-id*] **graceful-restart** [**verbose**]
Display OSPFv3 interface information.	**display ospfv3** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display OSPFv3 LSDB information.	**display ospfv3** [*process-id*] **lsdb** [{ **e-inter-prefix** | **e-inter-router** | **e-router** | **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **link** | **network** | **nssa** | **router** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]
Display OSPFv3 next hop information.	**display ospfv3** [*process-id*] **nexthop**
Display OSPFv3 NSR information.	**display ospfv3** [*process-id*] **non-stop-routing**
Display OSPFv3 routing information.	**display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length*]
Display OSPFv3 statistics.	**display ospfv3** [*process-id*] **statistics** [**error**]
Display OSPFv3 virtual link information.	**display ospfv3** [*process-id*] **vlink**
Clear OSPFv3 log information.	**reset ospfv3** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Restart an OSPFv3 process.	**reset ospfv3** [*process-id*] **process** [**graceful-restart**]
Restart OSPFv3 route redistribution.	**reset ospfv3** [*process-id*] **redistribution**
Clear OSPFv3 statistics.	**reset ospfv3** [*process-id*] **statistics**

OSPFv3 configuration examples



Example: Configuring OSPFv3 stub area

Network configuration

As shown in Figure 1:

- Enable OSPFv3 on all switches.
- Split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 2 as a stub area to reduce LSAs in the area without affecting route reachability.

Figure 1 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ospfv3 1 area 1
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
```

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 1 area 2
[SwitchC-Vlan-interface400] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] ospfv3 1 area 2
[SwitchD-Vlan-interface400] quit
```

Display OSPFv3 neighbors on Switch B.

```
[SwitchB] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 2.2.2.2

 Area: 0.0.0.0
--------------------------------------------------------------------------

3. Configure Area 2 as a stub area:

Configure Switch D.

```
[SwitchD] ospfv3
[SwitchD-ospfv3-1] area 2
[SwitchD-ospfv3-1-area-0.0.0.2] stub
[SwitchD-ospfv3-1-area-0.0.0.2] quit
[SwitchD-ospfv3-1] quit
```

Configure Switch C, and specify the cost of the default route sent to the stub area as 10.

```
[SwitchC] ospfv3
[SwitchC-ospfv3-1] area 2
[SwitchC-ospfv3-1-area-0.0.0.2] stub
[SwitchC-ospfv3-1-area-0.0.0.2] default-cost 10
[SwitchC-ospfv3-1-area-0.0.0.2] quit
[SwitchC-ospfv3-1] quit
```

Display OSPFv3 routing table information on Switch D.

```
[SwitchD] display ospfv3 routing

               OSPFv3 Process 1 with Router ID 4.4.4.4

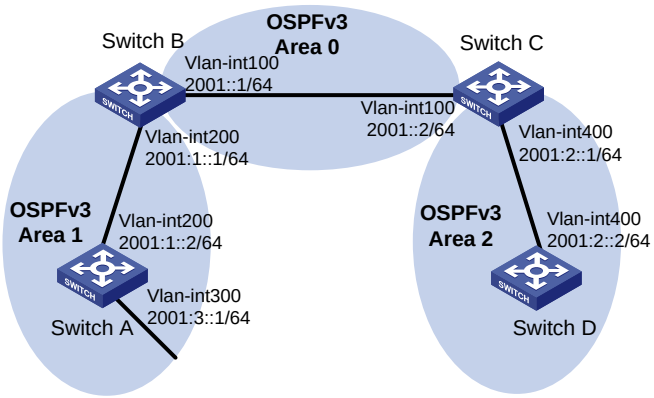
 Total: 2
 Intra area: 1         Inter area: 1         ASE: 0         NSSA: 0
```

The output shows that route entries are reduced. All indirect routes are removed, except the default route.



Example: Configuring OSPFv3 NSSA area

Network configuration

As shown in Figure 2:

- Configure OSPFv3 on all switches and split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch A as an ASBR to redistribute static routes into the AS.

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3 (see "Example: Configuring OSPFv3 stub area").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

```
[SwitchA] ospfv3
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] nssa
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] nssa
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Display OSPFv3 routing information on Switch D.

```
[SwitchD] display ospfv3 1 routing

              OSPFv3 Process 1 with Router ID 4.4.4.4
------------------------------------------------------------------------

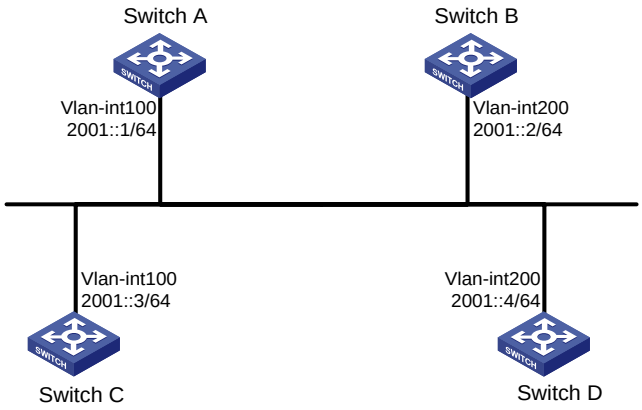
Intra area: 1         Inter area: 3         ASE: 1         NSSA: 0
```

The output shows an AS external route imported from the NSSA area exists on Switch D.



Example: Configuring OSPFv3 DR election

Network configuration

As shown in Figure 3:

- Configure router priority 100 for Switch A, the highest priority on the network, so it will become the DR.
- Configure router priority 2 for Switch C, the second highest priority on the network, so it will become the BDR.
- Configure router priority 0 for Switch B, so it cannot become a DR or BDR.
- Switch D uses the default router priority 1.

Figure 3 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 0
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 0
[SwitchB-Vlan-interface200] quit
```

   # On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

   # On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ospfv3 1 area 0
[SwitchD-Vlan-interface200] quit
```

   # Display neighbor information on Switch A. The switches have the same default DR priority 1, so Switch D (the switch with the highest router ID) is elected as the DR, and Switch C is the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. The neighbor states are all full.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         1   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:31  0      Vlan100
```

3. Configure router priorities for interfaces:

Set the router priority of VLAN-interface 100 to 100 on Switch A.

```
[SwitchA] interface Vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 dr-priority 100
[SwitchA-Vlan-interface100] quit
```

Set the router priority of VLAN-interface 200 to 0 on Switch B.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 dr-priority 0
[SwitchB-Vlan-interface200] quit
```

Set the router priority of VLAN-interface 100 to 2 on Switch C.

```
[SwitchC] interface Vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 dr-priority 2
[SwitchC-Vlan-interface100] quit
```

Display neighbor information on Switch A. Router priorities have been updated, but the DR and BDR are not changed.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan200
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. Switch D is still the DR.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         0   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

4. Restart DR and BDR election:

Use the **shutdown** and **undo shutdown** commands on interfaces to restart DR and BDR election. (Details not shown.)

Display neighbor information on Switch A. The output shows that Switch C becomes the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------

 4.4.4.4         1   Full/DROther      00:00:33  0      Vlan200
```

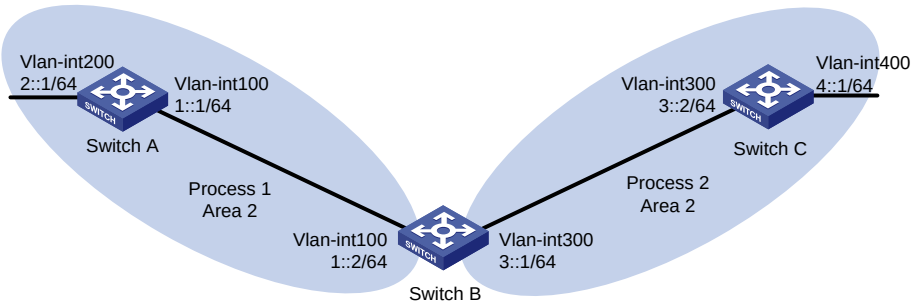
Display neighbor information on Switch D.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DR           00:00:30  0      Vlan100
 2.2.2.2         0   2-Way/DROther     00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

The output shows that Switch A becomes the DR.



Example: Configuring OSPFv3 route redistribution

Network configuration

As shown in Figure 4:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2.
- Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3. Switch C can then learn the routes destined for 1::0/64 and 2::0/64, and Switch A cannot learn the routes destined for 3::0/64 or 4::0/64.

Figure 4 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

   # Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

   # Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

   # Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

```

Example: Configuring OSPFv3 route summarization

Network configuration

As shown in Figure 5:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2, respectively.
- On Switch A, configure IPv6 addresses 2:1:1::1/64, 2:1:2::1/64, and 2:1:3::1/64 for VLAN-interface 200.
- On Switch B, configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1. Switch C can then learn the routes destined for 2::/64, 2:1:1::/64, 2:1:2::/64, and 2:1:3::/64.
- On Switch B, configure route summarization to advertise only summary route 2::/16 to Switch C.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 2:1:1::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:2::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:3::1 64
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

   # Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

   # Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

3. Configure OSPFv3 route redistribution:

   # Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1
[SwitchB-ospfv3-2] import-route direct
```

```
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 12 Routes : 12

Interface  : NULL0                                    Cost      : 0
```

4. Configure ASBR route summarization:

On Switch B, configure OSPFv3 process 2 to advertise a single route 2::/16.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] asbr-summary 2:: 16
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9

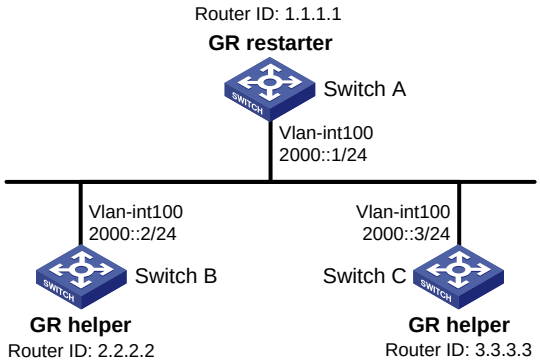
NextHop    : ::                                       Preference: 0
Interface  : NULL0                                    Cost      : 0

Destination: FF00::/8                                 Protocol  : Direct
```

```
NextHop    : ::                                    Preference: 0
Interface  : NULL0                                 Cost      : 0
```



Example: Configuring OSPFv3 GR

Network configuration

As shown in Figure 6:

- Switch A, Switch B, and Switch C that reside in the same AS and the same OSPFv3 routing domain are GR capable.
- Switch A acts as the GR restarter. Switch B and Switch C act as the GR helpers, and synchronize their LSDBs with Switch A through GR.

Figure 6 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 process 1, enable GR, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] graceful-restart enable
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable OSPFv3 and set the router ID to 2.2.2.2. (By default, GR helper is enabled on Switch B.)

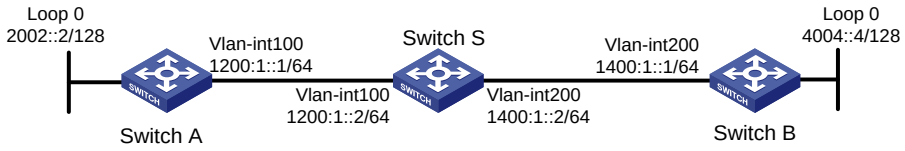
   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ospfv3 1 area 1
   [SwitchB-Vlan-interface100] quit
   ```

   # On Switch C, enable OSPFv3 and set the router ID to 3.3.3.3. (By default, GR helper is enabled on Switch C.)

   ```
   <SwitchC> system-view
   ```

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 1
[SwitchC-Vlan-interface100] quit
```

Verifying the configuration



Perform a master/backup switchover on Switch A to trigger an OSPFv3 GR operation. (Details not shown.)

Example: Configuring OSPFv3 NSR

Network configuration

As shown in Figure 7, Switch S, Switch A, and Switch B belong to the same OSPFv3 routing domain. Enable OSPFv3 NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 7 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch S, Switch A, and Switch B can communicate with each other at Layer 3. (Details not shown.)
3. Configure OSPFv3:

   # On Switch A, enable OSPFv3, and set the router ID to 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 1
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3, and set the router ID to 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch S, enable OSPFv3, and set the router ID to 3.3.3.3.

```
<SwitchS> system-view
[SwitchS] ospfv3 1
```

```
[SwitchS-ospfv3-1] router-id 3.3.3.3
[SwitchS-ospfv3-1] quit
[SwitchS] interface vlan-interface 100
[SwitchS-Vlan-interface100] ospfv3 1 area 1
[SwitchS-Vlan-interface100] quit
[SwitchS] interface vlan-interface 200
[SwitchS-Vlan-interface200] ospfv3 1 area 1
[SwitchS-Vlan-interface200] quit
```

4. Configure OSPFv3 NSR:

   # Enable OSPFv3 NSR on Switch S.

```
[SwitchS] ospfv3 1
[SwitchS-ospfv3-1] non-stop-routing
[SwitchS-ospfv3-1] quit
```

Verifying the configuration

Verify the following:

- When an active/standby switchover occurs on Switch S, the neighbor relationships and routing information on Switch A and Switch B have not changed. (Details not shown.)
- The traffic from Switch A to Switch B has not been impacted. (Details not shown.)

Example: Configuring BFD for OSPFv3

Network configuration

As shown in Figure 8:

- Configure OSPFv3 on Switch A, Switch B and Switch C and configure BFD over the link Switch A<—>L2 Switch<—>Switch B.
- After the link Switch A<—>L2 Switch<—>Switch B fails, BFD can quickly detect the failure and notify OSPFv3 of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 8 Network diagram

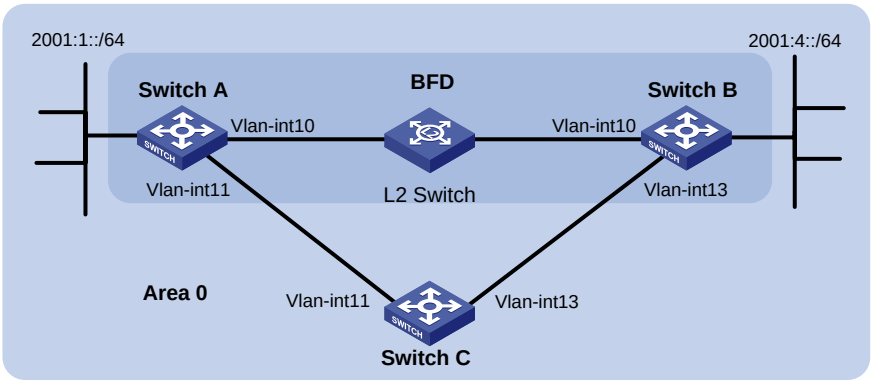


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64
Switch A	Vlan-int11	2001:2::1/64
Switch B	Vlan-int10	2001::2/64

Device	Interface	IPv6 address
Switch B	Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64
Switch C	Vlan-int13	2001:3::1/64

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 1 area 0
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ospfv3 1 area 0
[SwitchA-Vlan-interface11] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 1 area 0
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] ospfv3 1 area 0
[SwitchB-Vlan-interface13] quit
```

   # On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] ospfv3 1 area 0
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] ospfv3 1 area 0
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD:

   # Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 bfd enable
```

```
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
[SwitchA] display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv6 session working in control packet mode:

          Local discr: 1441                      Remote discr: 1450
            Source IP: FE80::20F:FF:FE00:1202 (link-local address of VLAN-interface 10
on Switch A)
       Destination IP: FE80::20F:FF:FE00:1200 (link-local address of VLAN-interface 10
on Switch B)
         Session state: Up                           Interface: Vlan10
             Hold time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::20F:FF:FE00:1200                     Preference: 10
Interface  : Vlan10                                     Cost      : 1
```

The output information shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

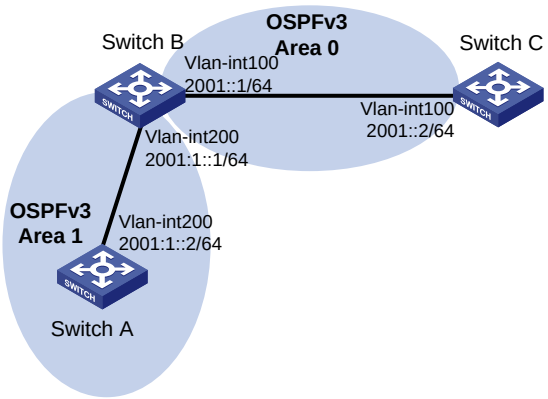
Display routes to 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::BAAF:67FF:FE27:DCD0                  Preference: 10
Interface  : Vlan11                                     Cost      : 2
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.



Example: Configuring OSPFv3 IPsec profile

Network configuration

As shown in Figure 9, all switches run OSPFv3, and the AS is divided into two areas.

Configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 9 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 basic features:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
```

```
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

3. Configure OSPFv3 IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchA] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchA-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-trans] protocol esp
  [SwitchA-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchA-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchA-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchA-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchB] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchB-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-trans] protocol esp
  [SwitchB-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchB-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchB-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchB-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  ```

```
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchB] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchB-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchB-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchB-ipsec-profile-manual-profile002] quit
```

- On Switch C:

Create an IPsec transform set named **trans**.

```
[SwitchC] ipsec transform-set trans
```

Specify the encapsulation mode as **transport**.

```
[SwitchC-ipsec-transform-set-trans] encapsulation-mode transport
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchC-ipsec-transform-set-trans] protocol esp
[SwitchC-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
[SwitchC-ipsec-transform-set-trans] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-trans] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchC] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchC-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchC-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchC-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchC-ipsec-profile-manual-profile002] quit
```

4. Apply the IPsec profiles to areas:

Configure Switch A.

```
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] area 0
```

```
[SwitchB-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Configure Switch C.

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
```

Verifying the configuration

Verify that OSPFv3 packets between Switches A, B, and C are protected by IPsec. (Details not shown.)

Configuring IPv6 PBR

About IPv6 PBR

IPv6 policy-based routing (PBR) uses user-defined policies to route IPv6 packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop.

IPv6 packet forwarding process

When the device receives an IPv6 packet, the device searches the IPv6 PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route to forward the packet if one of the following conditions exists:
     - No next hops are specified on the node.
     - Forwarding failed based on the next hops.
- The device perfoms routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

IPv6 PBR types

IPv6 PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as the ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface only.

Policy

An IPv6 policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

An IPv6 policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup for the packet.

Relationship between if-match clauses

IPv6 PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **apply** clauses for a node, but some of them might not be executed. For more information about the relationship between the **apply** clauses, see "Configuring actions for an IPv6 node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	In permit mode	**In deny mode**

Yes	• If the node contains **apply** clauses, IPv6 PBR executes the **apply** clauses on the node.
	  ○ If IPv6 PBR-based forwarding succeeds, IPv6 PBR does not compare the packet with the next node.
	  ○ If IPv6 PBR-based forwarding fails, IPv6 PBR compares the packet with the next node.
	• If the node does not contain **apply** clauses, the device performs a routing table lookup for the packet.
		The device performs a routing table lookup for the packet.

No	IPv6 PBR compares the packet with the next node.	IPv6 PBR compares the packet with the next node.

NOTE:

A node that has no **if-match** clauses matches any packet.

IPv6 PBR and Track

IPv6 PBR can work with the Track feature to dynamically adapt the availability status of an **apply** clause to the link status of a tracked object. The tracked object can be a next hop.

- When the track entry associated with an object changes to **Negative**, the **apply** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **apply** clause is valid.

For more information about Track and IPv6 PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: IPv6 PBR configuration

If a packet destined for the local device matches an IPv6 PBR policy, IPv6 PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure an IPv6 PBR policy, be careful to avoid this situation.

IPv6 PBR tasks at a glance

To configure IPv6 PBR, perform the following tasks:

1. Configuring an IPv6 policy
   a. Creating an IPv6 node
   b. Setting match criteria for an IPv6 node
   c. Configuring actions for an IPv6 node
2. Specifying a policy for IPv6 PBR

   Choose the following tasks as needed:
   - Specifying an IPv6 policy for IPv6 local PBR
   - Specifying an IPv6 policy for IPv6 interface PBR

Configuring an IPv6 policy

Creating an IPv6 node

1. Enter system view.

   system-view
2. Create an IPv6 policy or policy node and enter its view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the IPv6 policy node.

   description *text*

   By default, no description is configured for an IPv6 policy node.

Setting match criteria for an IPv6 node

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

     When using the ACL to match packets, IPv6 PBR ignores the action (**permit** or **deny**) and time range settings in the ACL. If the specified ACL does not exist, no packets will match this criterion.

Configuring actions for an IPv6 node

About this task

The **apply** clauses allow you to specify actions to take on matching packets on a node.

Restrictions and guidelines for action configuration

If you specify a next hop, IPv6 PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if IPv6 PBR does not update the route immediately after its availability status changes.

Configuring actions for a node

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Configure actions for a node.
   - Set next hops for permitted IPv6 packets.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-2>

     By default, no next hops are specified.

     You can specify multiple next hops for backup in one command line or by executing this command multiple times. You can specify a maximum of two next hops for a node.

     If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

Specifying a policy for IPv6 PBR

Specifying an IPv6 policy for IPv6 local PBR

About this task

Perform this task to specify an IPv6 policy for IPv6 local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for IPv6 local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR might affect local services, such as ping and Telnet. When you use IPv6 local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view
2. Specify an IPv6 policy for IPv6 local PBR.

   ipv6 local policy-based-route *policy-name*

   By default, IPv6 local PBR is not enabled.

Specifying an IPv6 policy for IPv6 interface PBR

About this task

Perform this task to apply an IPv6 policy to an interface to guide the forwarding of packets received on the interface only.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

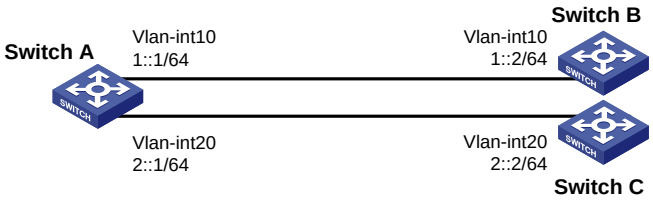
1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IPv6 policy for IPv6 interface PBR.
   ipv6 policy-based-route *policy-name*
   By default, no IPv6 policy is applied to the interface.

Display and maintenance commands for IPv6 PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PBR policy information.	**display ipv6 policy-based-route** [**policy** *policy-name*]
Display IPv6 interface PBR configuration and statistics.	**display ipv6 policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display IPv6 local PBR configuration and statistics.	**display ipv6 policy-based-route local** [**slot** *slot-number*]
Display IPv6 PBR configuration.	**display ipv6 policy-based-route setup**
Clear IPv6 PBR statistics.	**reset ipv6 policy-based-route statistics** [**policy** *policy-name*]

IPv6 PBR configuration examples



Example: Configuring packet type-based IPv6 local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C are connected through Switch A. Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets to the next hop 1::2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IPv6 addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ipv6 address 1::1 64
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 2::1 64
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3001 to match TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 local PBR by applying policy **aaa** to Switch A.

   ```
   [SwitchA] ipv6 local policy-based-route aaa
   ```

2. Configure Switch B:

   # Create VLAN 10.

   ```
   <SwitchB> system-view
   [SwitchB] vlan 10
   ```

```
[SwitchB-vlan10] quit
```

Configure the IPv6 address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
[SwitchB-Vlan-interface10] quit
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IPv6 address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
[SwitchC-Vlan-interface20] quit
```

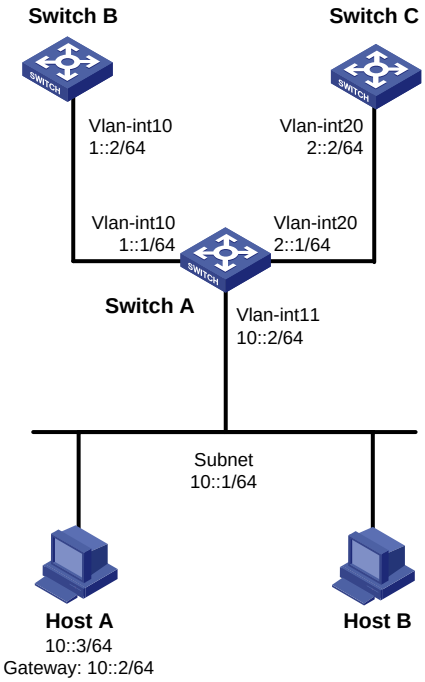
Verifying the configuration

1. Perform telnet operations to verify that IPv6 local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based IPv6 interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1::2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses and unicast routing protocol settings to make sure that Switch B and Switch C each have a route to reach Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3001 to match TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 interface PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   [SwitchA-Vlan-interface11] ipv6 policy-based-route aaa
   [SwitchA-Vlan-interface11] quit
   ```

Verifying the configuration

1. Enable IPv6 and configure the IPv6 address 10::3 for Host A.

   ```
   C:\>ipv6 install
   Installing...
   Succeeded.
   C:\>ipv6 adu 4/10::3
   ```

2. Perform telnet operations to verify that IPv6 interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

3. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)

Configuring routing policies

About routing policies

Routing policies control routing paths by filtering and modifying routing information.

Routing policies can filter advertised, received, and redistributed routes, and modify attributes for specific routes.

Implementation of a routing policy

To configure a routing policy:

1. **Define route filters**—Configure filters based on route attributes.
2. **Apply route filters**—Create a routing policy and apply filters to the routing policy.

Filters

Routing policies can use the following filters to match routes.

ACL

An Access Control List (ACL) can match the destination or next hop of routes.

For more information about ACLs, see ACL configuration in *ACL and QoS Configuration Guide*.

IP prefix list

An IP prefix list matches the destination address of routes.

An IP prefix list can contain multiple items that specify prefix ranges. Each destination IP address prefix of a route is compared with these items in ascending order of their index numbers. A prefix matches the IP prefix list if it matches one item in the list.

RD list

A route distinguisher (RD) list matches the RD of routes. After you add an RD as a prefix to an IPv4 address prefix, the address prefix becomes a unique VPN-IPv4 address prefix.

An RD list is identified by an RD list number and can contain multiple items that specify RD ranges. Each item is identified by an index number. The RD of a route is compared with these items in ascending order of their index numbers. An RD matches the RD list if it matches one item in the list.

For information about RD, see MCE configuration in *MCE Configuration Guide*.

Routing policy

A routing policy can contain multiple nodes, which are in a logical OR relationship. A node with a smaller number is matched first. A route matches the routing policy if it matches one node (except the node configured with the **continue** clause) in the routing policy.

Each node has a match mode of **permit** or **deny**.

- **permit**—Specifies the **permit** match mode for a routing policy node. If a route meets all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. The route is not compared with the next node unless the **continue** clause is configured. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.
- **deny**—Specifies the **deny** match mode for a routing policy node. The **apply** and **continue** clauses of a deny node are never executed. If a route meets all the **if-match** clauses of the

node, it is denied without being compared with the next node. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.

A node can contain a set of **if-match**, **apply**, and **continue** clauses.

- **if-match** clauses—Specify the match criteria that match the attributes of routes. The **if-match** clauses of different types are in a logical AND relationship and the **if-match** clauses of the same type are in a logical OR relationship. A route must meet **if-match** clauses of all types to match the node.
- **apply** clauses—Specify the actions to be taken on permitted routes, such as modifying a route attribute.
- **continue** clause—Specifies the next node. A route that matches the current node (permit node) must match the specified next node in the same routing policy. The **continue** clause combines the **if-match** and **apply** clauses of the two nodes to improve flexibility of the routing policy. After you configure a **continue** clause, a route can pass the routing policy even if it does not match the specified next node. To reject such a route, add a **deny** node without clauses.

Follow these guidelines when you configure **if-match**, **apply**, and **continue** clauses:

- If you only want to filter routes, do not configure **apply** clauses.
- If you do not configure any **if-match** clauses for a permit node, the node will permit all routes.
- Configure a permit node containing no **if-match** or **apply** clauses following multiple deny nodes to allow unmatched routes to pass.

Routing policy tasks at a glance

To configure a routing policy, perform the following tasks:

1. (Optional.) Configure filters:
   - Configuring an IPv4 prefix list
   - Configuring an IPv6 prefix list
   - Configuring an RD list
2. Configuring a routing policy:
   a. Creating a routing policy
   b. Configuring if-match clauses
   c. Configuring apply clauses
   d. Configuring the continue clause

Configuring an IPv4 prefix list

About this task

An IPv4 prefix list is used to filter IPv4 addresses. It can contain multiple items, each of which specifies a range of IPv4 prefixes. The relation between the items is logical OR. A route can pass an IPv4 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv4 prefix list cannot be passed.

Restrictions and guidelines

If the *ip-address mask-length* argument is specified as 0.0.0.0 0, only the default route will be matched. To match all routes, use `0.0.0.0 0` **`less-equal`** `32`.

If all the items are set to **deny** mode, no routes can pass the IPv4 prefix list. To permit unmatched IPv4 routes, you must configure the **permit** 0.0.0.0 0 **less-equal** 32 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

Configuring an IPv6 prefix list

About this task

An IPv6 prefix list is used to filter IPv6 addresses. It can contain multiple items, each of which specifies a range of IPv6 prefixes. The relation between the items is logical OR. A route can pass an IPv6 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv6 prefix list cannot be passed.

Restrictions and guidelines

If the *ipv6-address prefix-length* argument is specified as :: 0, only the default route matches. To match all routes, configure **:: 0 less-equal** 128.

If all items are set to **deny** mode, no routes can pass the IPv6 prefix list. To permit unmatched IPv6 routes, you must configure the **permit** :: 0 **less-equal** 128 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 prefix list.

   ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { **inverse** *inverse-prefix-length* | *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] }

Configuring an RD list

About this task

RD lists are used to filter VPN routing information. You can configure multiple items for an RD list that is identified by a number. The relationship between the items is logical OR. A route matches the RD list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an RD list.

   ip rd-list *rd-list-number* [**index** *index-number*] { **deny** | **permit** } *route-distinguisher*&<1-10>

Configuring a routing policy

Creating a routing policy

About this task

A routing policy must have a minimum of one permit node. If all the nodes are in **deny** mode, no routes can pass the routing policy.

Procedure

1. Enter system view.

   system-view

2. Create a routing policy and a node, and enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

Configuring if-match clauses

About this task

You can either specify no **if-match** clauses or multiple **if-match** clauses for a routing policy node. If no **if-match** clause is specified for a permit node, all routes can pass the node. If no **if-match** clause is specified for a deny node, no routes can pass the node.

Restrictions and guidelines

When you configure **if-match** clauses, follow these restrictions and guidelines:

- The **if-match** clauses of a routing policy node have a logical AND relationship. A route must meet all **if-match** clauses before it can be executed by the **apply** clauses of the node. If an **if-match** command exceeds the maximum length, multiple **if-match** clauses of the same type are generated. These clauses have a logical OR relationship. A route only needs to meet one of them.
- All IPv4 routes match a node if the **if-match** clauses of the node use only IPv6 ACLs. All IPv6 routes match a node if the **if-match** clauses of the node use only IPv4 ACLs.
- If the ACL used by an **if-match** clause does not exist or the ACL is not configured with any rules, the clause is always matched. When the ACL of an **if-match** clause is configured with rules, a route cannot match the **if-match** clause in one of the following scenarios:
  - The route cannot match any rule of the specified ACL.
  - The route matches a deny-mode rule of the specified ACL.
- If the prefix list or RD list used by an **if-match** clause does not exist, the clause is always matched. The clause is not matched if one of the following conditions exists:
  - No rules of the specified prefix list or RD list are matched.
  - The specified prefix list or RD list is in **deny** mode.
- The **rule** [*rule-id*] **permit ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command can create a rule for an advanced ACL to match specific routes. The **source** *sour-addr sour-wildcard* option represents the destination network address and the **destination** *dest-addr dest-wildcard* option represents the mask in dotted decimal notation. For example, to match route 3.3.3.0/24, the rule configuration should be **rule** [*rule-id*] **permit ip source** 3.3.3.0 0.0.0.255 **destination** 255.255.255.0 0.0.0.255.

Procedure

1. Enter system view.

system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Match routes whose destination, next hop, or source address matches an ACL or prefix list.

   IPv4:

   if-match ip { **address** | **next-hop** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

   IPv6:

   if-match ipv6 { **address** | **next-hop** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name* }

   By default, no ACL or prefix list match criterion is configured.

   The ACL specified in an **if-match** clause must be a non-VPN ACL.

4. Configure route match criteria.

   - Match routes having the specified cost.

     if-match cost *cost-value*

   - Match routes having the specified output interface.

     if-match interface { *interface-type interface-number* }&<1-16>

   - Match routes having the specified route type.

     if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *

   - Match IGP routes having the specified tag value.

     if-match tag *tag-value*

   By default, no route match criteria are configured.

5. Match routes whose RD matches the specified RD list.

   if-match rd-list *rd-list-number*

   By default, no RD match criterion is configured.

Configuring apply clauses

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Configure the route cost and cost type.

   - Set a cost for routes.

     apply cost [**+** | **-**] *cost-value*

     By default, no cost is set for routes.

   - Set a cost type for routes.

     apply cost-type { **type-1** | **type-2** }

     By default, no cost type is set for routes.

4. Set the next hop for routes.

   IPv4:

   apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

IPv6:

apply ipv6 next-hop *ipv6-address*

By default, no next hop is set for routes.

The configuration does not apply to redistributed routes.

5. Configure route priorities.
   - Set an IP precedence for matching routes.

     apply ip-precedence { *value* | **clear** }

     By default, no IP precedence is set.
   - Set a preference.

     apply preference *preference*

     By default, no preference is set.
   - Set a prefix priority.

     apply prefix-priority { **critical** | **high** | **medium** }

     By default, the prefix priority is low.
6. Set a tag value for IGP routes.

   apply tag *tag-value*

   By default, no tag value is set for IGP routes.
7. Set a backup link for fast reroute (FRR).

   IPv4:

   apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }

   IPv6:

   apply ipv6 fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ipv6-address*] | **backup-nexthop** *ipv6-address* }

   By default, no backup link is set for FRR.

Configuring the continue clause

Restrictions and guidelines

When you configure the **continue** clause to combine multiple nodes, follow these restrictions and guidelines:

- If you configure an **apply** clause that sets different attribute values on all the nodes, the **apply** clause of the node configured most recently takes effect.
- If you configure the **apply cost** with the **+** or **–** keyword on all the nodes, the **apply cost** clause of each node takes effect.

Procedure

1. Enter system view.

   system-view
2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
3. Specify the next node to be matched.

   continue [*node-number*]

   By default, no continue clause is configured.

   The specified next node must have a larger number than the current node.

Configuring the routing policy change delay timer

About this task

This feature makes a routing policy take effect after a delayed time interval, which prevents incomplete routing policy configuration from being issued to cause incorrect route advertisement. The system automatically starts the timer when a routing policy changes. The changes will not take effect on the policy until the change delay timer expires.

A routing policy changes when one of the following events occurs:

- A routing policy is created.
- A routing policy node, **if-match** clause, or **apply** clause is added, modified, or deleted for a routing policy.
- You add, modify, or delete one of the following lists:
  - IPv4 prefix list.
  - IPv6 prefix list.
- The ACL used by an **if-match** clause changes.

Procedure

1. Enter system view.

   system-view
2. Set the routing policy change delay timer.

   route-policy-change delay-time { *time-value* | **unlimited** }

   By default, routing policy changes immediately take effect, but the routing protocol waits five seconds before processing routes from the new routing policy.

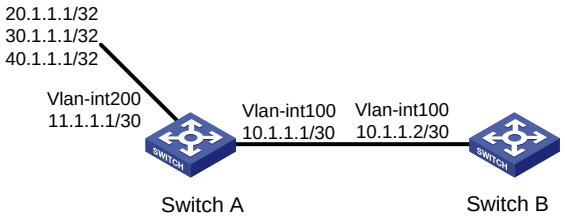
   When the delay timer expires, the routing protocol waits five seconds before processing routes from the new routing policy.

Display and maintenance commands for routing policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv4 prefix list statistics.	**display ip prefix-list** [**name** *prefix-list-name*]
Display RD list information.	**display ip rd-list** [*rd-list-number*]
Display IPv6 prefix list statistics.	**display ipv6 prefix-list** [**name** *prefix-list-name*]
Display routing policy information.	**display route-policy** [**name** *route-policy-name*]
Clear IPv4 prefix list statistics.	**reset ip prefix-list** [*prefix-list-name*]
Clear IPv6 prefix list statistics.	**reset ipv6 prefix-list** [*prefix-list-name*]

Routing policy configuration examples



Example: Configuring a routing policy for redistributing static routes to RIP

Network configuration

As shown in Figure 1, Switch A exchanges routing information with Switch B by using RIP.

On Switch A, configure three static routes. Use a routing policy to configure Switch B to redistribute networks 20.1.1.1/32 and 40.1.1.1/32 and block network 30.1.1.1/32.

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Configure IP addresses for interfaces VLAN-interface 100 and VLAN-interface 200.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] ip address 10.1.1.1 30
   [SwitchA-vlan-interface100] quit
   [SwitchA] interface vlan-interface 200
   [SwitchA-vlan-interface200] ip address 11.1.1.1 30
   [SwitchA-vlan-interface200] quit
   ```

   # Enable RIP on interface VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] rip 1 enable
   [SwitchA-vlan-interface100] quit
   ```

   # Configure three static routes and set the next hop of the three routes to 11.1.1.2.

   ```
   [SwitchA] ip route-static 20.1.1.1 32 11.1.1.2
   [SwitchA] ip route-static 30.1.1.1 32 11.1.1.2
   [SwitchA] ip route-static 40.1.1.1 32 11.1.1.2
   ```

   # Configure a routing policy.

   ```
   [SwitchA] ip prefix-list a index 10 permit 30.1.1.1 32
   [SwitchA] route-policy static2rip deny node 0
   [SwitchA-route-policy-static2rip-0] if-match ip address prefix-list a
   [SwitchA-route-policy-static2rip-0] quit
   [SwitchA] route-policy static2rip permit node 10
   [SwitchA-route-policy-static2rip-10] quit
   ```

   # Enable RIP and apply routing policy **static2rip** to filter redistributed static routes.

   ```
   [SwitchA] rip
   ```

```
[SwitchA-rip-1] import-route static route-policy static2rip
```

2. Configure Switch B:

Configure an IP address for interface VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] ip address 10.1.1.2 30
```

Enable RIP.

```
[SwitchB] rip
[SwitchB-rip-1] quit
```

Enable RIP on the interface.

```
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] rip 1 enable
[SwitchB-vlan-interface100] quit
```

Verifying the configuration

Display the routing table information on Switch B.

```
<SwitchB> display ip routing-table

Destinations : 14       Routes : 14

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0
10.1.1.0/30         Direct  0   0           10.1.1.2        Vlan100

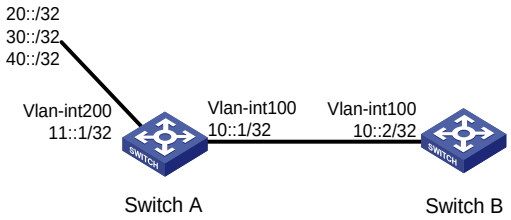
```



Example: Configuring a routing policy for IPv6 route redistribution

Network configuration

As shown in Figure 2:

- Run RIPng on Switch A and Switch B.
- Configure three static routes on Switch A.
- On Switch A, apply a routing policy to redistribute static routes 20::/32 and 40::/32 and deny route 30::/32.

Figure 2 Network diagram

Procedure

1. Configure Switch A:

Configure IPv6 addresses for VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 address 10::1 32
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 11::1 32
[SwitchA-Vlan-interface200] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

Configure three static routes with next hop 11::2, and make sure the static routes are active.

```
[SwitchA] ipv6 route-static 20:: 32 11::2
[SwitchA] ipv6 route-static 30:: 32 11::2
[SwitchA] ipv6 route-static 40:: 32 11::2
```

Configure a routing policy.

```
[SwitchA] ipv6 prefix-list a index 10 permit 30:: 32
[SwitchA] route-policy static2ripng deny node 0
[SwitchA-route-policy-static2ripng-0] if-match ipv6 address prefix-list a
[SwitchA-route-policy-static2ripng-0] quit
[SwitchA] route-policy static2ripng permit node 10
[SwitchA-route-policy-static2ripng-10] quit
```

Enable RIPng and apply the routing policy to static route redistribution.

```
[SwitchA] ripng
[SwitchA-ripng-1] import-route static route-policy static2ripng
```

2. Configure Switch B:

Configure the IPv6 address for VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipv6 address 10::2 32
```

Enable RIPng.

```
[SwitchB] ripng
[SwitchB-ripng-1] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
```

```
[SwitchB-Vlan-interface100] quit
```

Verifying the configuration

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------

 Peer FE80::7D58:0:CA03:1 on Vlan-interface 100
 Destination 20::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 8 secs
 Destination 40::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 3 secs
 Local route
 Destination 10::/32,
     via ::, cost 0, tag 0, DOF
```

Configuring DCN

About DCN

Data communication network (DCN) is built for the network management system (NMS) to implement operation, administration, and maintenance (OAM) on the network elements (NEs).

On large-scaled networks with DCN configured, the NMS remotely manages and controls all NEs through the gateway network element (GNE), which reduces operation and maintenance costs.

On the DCN network, all NEs must operate in Area 0 of OSPF process 65535.

Basic concepts

NE

A network device managed by the NMS on the DCN network.

GNE

The NE that is directly connected to the NMS. The NSM communicates with the GNE at the network layer or application layer and manages the NEs through the GNE.

NE table

Stores the NE ID-to-NE IP mappings for each NE in the DCN domain. After DCN is enabled, an NE encapsulates its NE ID and NE IP in a Type-10 Opaque LSA. It floods the LSA to synchronize the mappings with other NEs in the DCN domain.

The NE IP in the Type-10 Opaque LSA might be inconsistent with the NE's router ID when DCN is enabled on an OSPF network. Devices from other vendors will fail to identify the NE. To avoid this problem, make sure the following requirements are met:

- Change the router ID by modifying the NE IP. Do not change the default IP address of the DCN's loopback interface.
- Do not associate other loopback interfaces with the DCN VPN instance.

GNE

The GNE allows the NMS to access NEs on the DCN network. The GNE provides the NE ID-to-NE IP mappings of all NEs for the Telnet users to access the target NE remotely.

NE search

The NE search feature allows the NMS to search for all NEs that are connected to the GNE. With this feature, the GNE can report information about all NEs in its NE table and the GNE itself to the NMS.

Automatic report

The automatic report feature enables the GNE to automatically report online or offline events of NEs to the NMS.

DCN tasks at a glance

To configure DCN, perform the following tasks:

1. Enabling DCN
2. (Optional.) Configuring the NE ID and NE IP
3. Configuring DCN VPN
4. (Optional.) Enabling the automatic report feature
5. Configuring the LLDP features
   a. (Optional.) Configuring the source MAC address of LLDP frames
   b. Advertising the LLDP management address
   c. Enabling the device to generate ARP entries for received management address LLDP TLVs

Enabling DCN

About this task

After DCN is enabled, the device assigns an NE IP to the loopback interface with the largest interface number and uses the interface for communication. The NE IP is specified as the management address and advertised in an LLDP frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enable DCN and enter DCN view.
   `dcn`
   By default, DCN is disabled.

Configuring the NE ID and NE IP

About this task

Typically an NE automatically generates an NE IP according to its NE ID. The automatically generated NE IP changes when the NE ID changes. When you replan your network or an NE ID conflict occurs, you can manually configure the NE ID and NE IP. The manually configured NE IP does not change when the NE ID changes.

Procedure

1. Enter system view.
   `system-view`
2. Enter DCN view.
   `dcn`
3. Configure the NE ID.
   `ne-id` *`id-number`*
   By default, the NE ID is automatically generated by using the 24 low-order bits of the bridge MAC address.
4. Configure the NE IP.
   `ne-ip` *`ip-address`* { *`mask-length`* | *`mask`* }

By default, the NE IP is automatically generated by using 129 as the eight high-order bits and the NE ID as the rest 16 bits. The mask length is 32.

Configuring DCN VPN

About this task

Perform this task to ensure the independence of DCN services. For more information about VPN instances, see MCE configuration in *MCE Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create a VPN instance and enter its view, or enter the view of an existing VPN instance.

   ip vpn-instance *vpn-instance-name*

   For more information about this command, see MCE configuration in *MCE Configuration Guide*.

3. Quit VPN instance view.

   quit

4. Create a loopback interface and enter its view, or enter the view of an existing loopback interface.

   interface loopback *interface-number*

5. Associate the loopback interface with a VPN instance.

   ip binding vpn-instance *vpn-instance-name*

   By default, the loopback interface is not associated with a VPN instance.

   For more information about this command, see MCE configuration in *MCE Configuration Guide*.

Enabling the automatic report feature

Restrictions and guidelines

Perform this task only on GNE to enable it to automatically report online or offline events of NEs to the NMS.

Procedure

1. Enter system view.

   system-view

2. Enter DCN view.

   dcn

3. Enable the automatic report feature.

   auto-report

   By default, the automatic report feature is disabled.

Configuring the LLDP features

Configuring the source MAC address of LLDP frames

About this task

Perform this task to configure the MAC address of the as the source MAC address of LLDP frames. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the MAC address of the Dot1q termination-enabled VLAN interface as the source MAC address of LLDP frames.

   lldp source-mac vlan *vlan-id*

   By default, the MAC address of the current Ethernet interface is specified as the source MAC address of LLDP frames.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Advertising the LLDP management address

About this task

An NE on the DCN network learns the MAC address of its neighbor through LLDP. Perform this task to enable an NE to advertise the IP address of the specified loopback interface (management address) for ARP entry learning. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Advertise the LLDP management address.

   lldp tlv-enable basic-tlv management-address-tlv [*ip-address* | **interface loopback** *interface-number*]

   By default, the LLDP management address is not advertised.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Enabling the device to generate ARP entries for received management address LLDP TLVs

About this task

This feature enables the device to generate an ARP entry for a received LLDP frame that meets the following requirements:

- The LLDP frame carries a management address TLV.
- The management address TLV contains an IPv4 address.

The generated ARP entry contains the management address and the source MAC address of the frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the device to generate an ARP entry when receiving a management address LLDP TLV.

   lldp management-address arp-learning vlan *vlan-id*

   By default, the device does not generate an ARP entry when receiving a management address LLDP TLV.

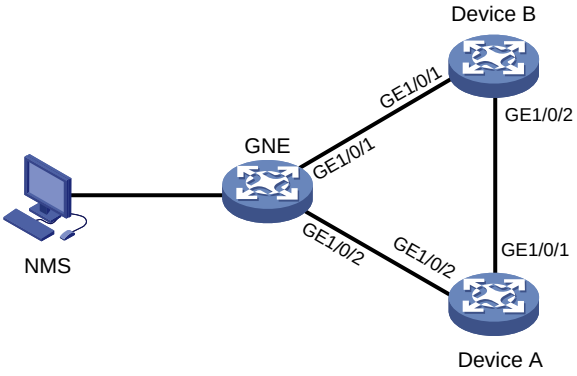
   The *vlan-id* argument specifies the VLAN ID of a VLAN interface.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Display and maintenance commands for DCN

Execute the **display** commands in any view.

Task	Command
Display the brief DCN information.	**display dcn**
Display information about all online NEs on the DCN network.	**display dcn ne-info**



DCN configuration examples

Example: Configuring DCN

Network configuration

As shown in Figure 1, the GNE, Device A, and Device B run DCN in the same VPN instance. The NMS uses SNMP to manage the GNE, and the GNE automatically sends notifications to the NMS to report online or offline events of NEs.

Figure 1 Network diagram

Procedure

1. Configure the GNE:

   # Enable SNMP on the GNE. (Details not shown. For more information, see *Network Management and Monitoring Configuration Guide*.)

   # Enable DCN, configure the NE ID as 100001 and NE IP as 11.1.1.1/32, and enable the automatic report feature.

   ```
   <GNE> system-view
   [GNE] dcn
   [GNE-dcn] ne-id 100001
   [GNE-dcn] ne-ip 11.1.1.1 32
   [GNE-dcn] auto-report
   [GNE-dcn] quit
   ```

   # Create a VPN instance named **dcn_vpn**.

   ```
   [GNE] ip vpn-instance dcn_vpn
   [GNE-vpn-instance-dcn_vpn] quit
   ```

   # Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

   ```
   [GNE] interface loopback 1023
   [GNE-LoopBack1023] ip binding vpn-instance dcn_vpn
   [GNE-LoopBack1023] quit
   ```

   # Enable LLDP globally.

   ```
   [GNE] lldp global enable
   ```

   # Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

   ```
   [GNE] interface Gigabitethernet 1/0/1
   [GNE-GigabitEthernet1/0/1] port access vlan 3001
   [GNE-GigabitEthernet1/0/1] lldp source-mac vlan 3001
   [GNE-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
   interface loopback 1023
   ```

   # Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 4094 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

   ```
   [GNE-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
   [GNE-GigabitEthernet1/0/1] quit
   ```

   # Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[GNE] interface Gigabitethernet 1/0/2
[GNE-GigabitEthernet1/0/2] port access vlan 3002
[GNE-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[GNE-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 4094 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[GNE-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[GNE-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3001] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

```
 [GNE] interface Vlan-interface 3002
[GNE-Vlan-interface3002] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3002] quit
```

Enable OSPF process 65535 and create area 0.

```
[GNE] ospf 65535 vpn-instance dcn_vpn
[GNE-ospf-65535] area 0
[GNE-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[GNE-ospf-65535-area-0.0.0.0] quit
[GNE-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ospf network-type p2p
[GNE-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[GNE] interface Vlan-interface 3002
[GNE-Vlan-interface3002] ospf network-type p2p
[GNE-Vlan-interface3002] quit
```

2. Configure Device A:

Enable DCN, configure the NE ID as 200002 and NE IP as 22.2.2.2/32.

```
<DeviceA> system-view
[DeviceA] dcn
[DeviceA-dcn] ne-id 200002
[DeviceA-dcn] ne-ip 22.2.2.2 32
[DeviceA-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceA] ip vpn-instance dcn_vpn
[DeviceA-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceA] interface loopback 1023
[DeviceA-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceA-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceA] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface Gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port access vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3002 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface Gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port access vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp source-mac vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3003 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3003
[DeviceA-GigabitEthernet1/0/1] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

```
[DeviceA] interface Vlan-interface 3002
[DeviceA-Vlan-interface3002] ip address unnumbered interface loopback 1023
[DeviceA-Vlan-interface3002] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceA-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceA] ospf 65535 vpn-instance dcn_vpn
[DeviceA-ospf-65535] area 0
[DeviceA-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceA-ospf-65535-area-0.0.0.0] quit
[DeviceA-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[DeviceA] interface Vlan-interface 3002
[DeviceA-Vlan-interface3002] ospf network-type p2p
[DeviceA-Vlan-interface3002] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ospf network-type p2p
[DeviceA-Vlan-interface3003] quit
```

3. Configure Device B:

Enable DCN, configure the NE ID as 300003 and NE IP as 33.3.3.3/32.

```
<DeviceB> system-view
[DeviceB] dcn
[DeviceB-dcn] ne-id 300003
[DeviceB-dcn] ne-ip 33.3.3.3 32
[DeviceB-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceB] ip vpn-instance dcn_vpn
[DeviceB-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceB] interface loopback 1023
[DeviceB-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceB-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceB] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceB] interface GigabitEthernet1/0/1
[DeviceB-GigabitEthernet1/0/1] port access vlan 3001
[DeviceB-GigabitEthernet1/0/1] lldp source-mac vlan 3001
[DeviceB-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3001 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[DeviceB-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
[DeviceB-GigabitEthernet1/0/1] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceB] interface GigabitEthernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port access vlan 3003
[DeviceB-GigabitEthernet1/0/2] lldp source-mac vlan 3003
[DeviceB-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3003 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceB-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3003
[DeviceB-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3001] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceB] ospf 65535 vpn-instance dcn_vpn
[DeviceB-ospf-65535] area 0
[DeviceB-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceB-ospf-65535-area-0.0.0.0] quit
[DeviceB-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ospf network-type p2p
[DeviceB-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ospf network-type p2p
[DeviceB-Vlan-interface3003] quit
```

Verifying the configuration

Display brief DCN information on the GNE.

```
[GNE] display dcn

              DCN Brief Information

 NE ID        : 0x100001
 NE IP        : 11.1.1.1
 Mask         : 255.255.255.255
 DCN interface: LoopBack1023
 Auto report  : Enabled
```

Display all DCN NE information on the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

 NE ID          NE IP            Metric   Device Type
 0x100001       11.1.1.1         0        H3C S5135S-24P4S-EI
 0x200002       22.2.2.2         1        H3C S5135S-24P4S-EI
 0x300003       33.3.3.3         1        H3C S5135S-24P4S-EI

 Total number: 3
```

The output shows that GNE, Device A, and Device B are online. The GNE notifies the NMS of the online event. You can successfully ping the NE IP addresses of Device A and Device B from the GNE.

Remove Device B from the DCN network and display all DCN NE information for the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

 NE ID          NE IP            Metric   Device Type
 0x100001       11.1.1.1         0        H3C S5135S-24P4S-EI
 0x200002       22.2.2.2         1        H3C S5135S-24P4S-EI
```

```
Total number: 2
```

The output shows that GNE and Device A are online. The GNE notifies the NMS of the offline event of Device B. You can still successfully ping the NE IP address of Device A from the GNE.

Preface

This configuration guide covers Layer 3 IPv4 multicast protocols and Layer 3 IPv6 multicast protocols.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

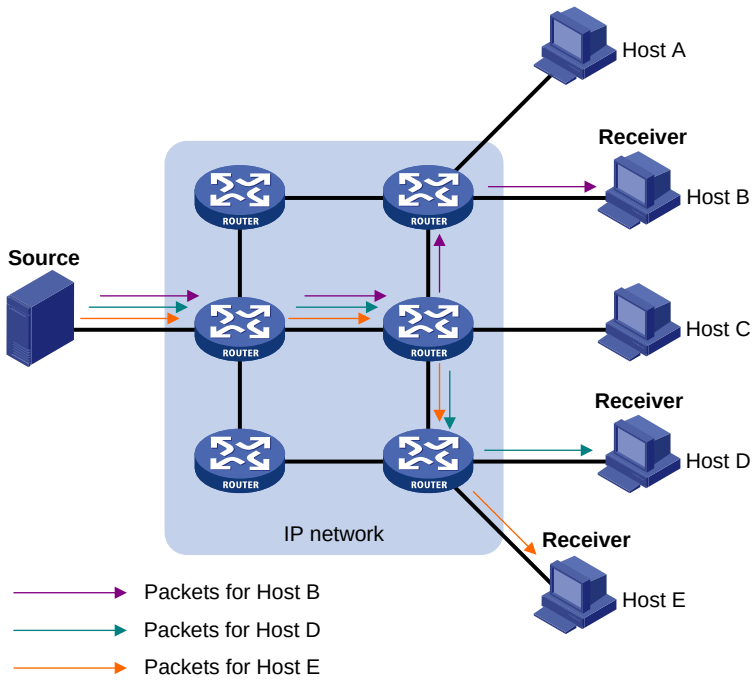
Multicast overview

Introduction to multicast

As a technique that coexists with unicast and broadcast, the multicast technique effectively addresses the issue of point-to-multipoint data transmission. By enabling high-efficiency point-to-multipoint data transmission over a network, multicast greatly saves network bandwidth and reduces network load.

By using multicast technology, a network operator can easily provide bandwidth-critical and time-critical information services. These services include live webcasting, Web TV, distance learning, telemedicine, Web radio, and real-time video conferencing.



Information transmission techniques

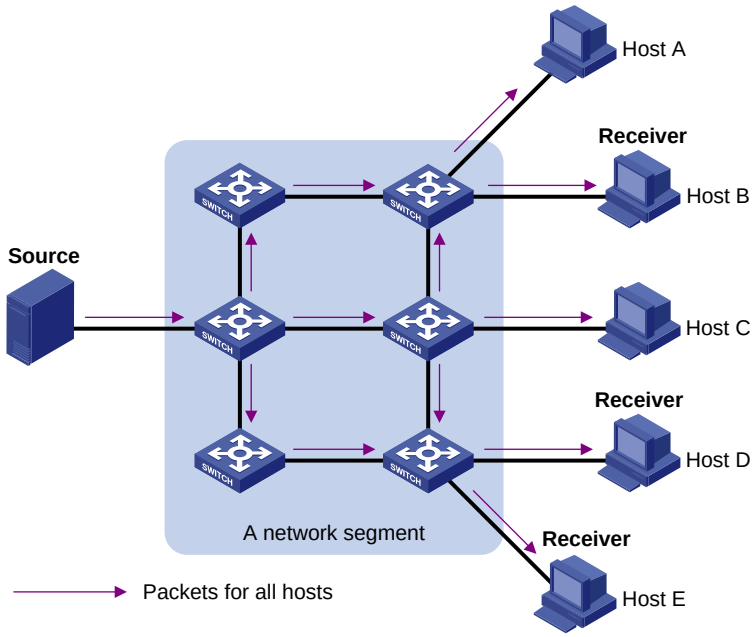
The information transmission techniques include unicast, broadcast, and multicast.

Unicast

In unicast transmission, the information source must send a separate copy of information to each host that needs the information.

Figure 1 Unicast transmission

In Figure 1, Host B, Host D, and Host E need the information. A separate transmission channel must be established from the information source to each of these hosts.



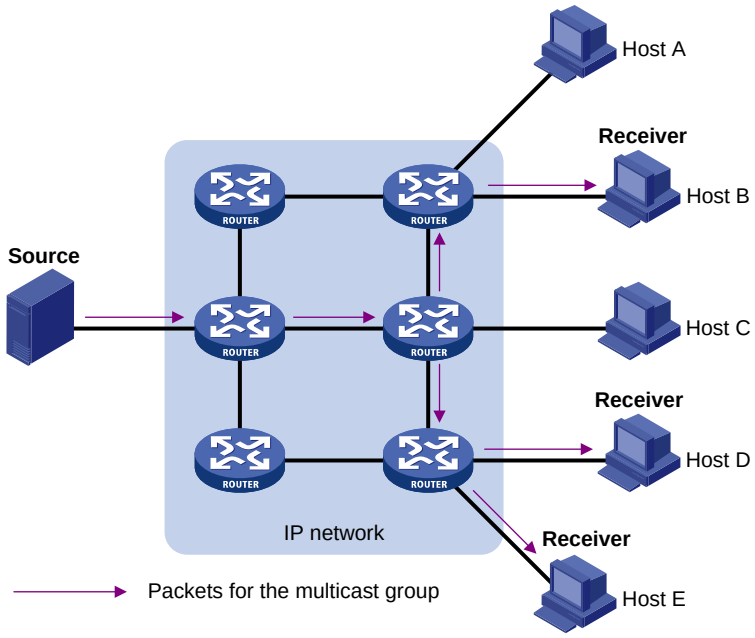
In unicast transmission, the traffic transmitted over the network is proportional to the number of hosts that need the information. If a large number of hosts need the information, the information source must send a separate copy of the same information to each of these hosts. Sending many copies can place a tremendous pressure on the information source and the network bandwidth.

Unicast is not suitable for batch transmission of information.

Broadcast

In broadcast transmission, the information source sends information to all hosts on the subnet, even if some hosts do not need the information.

Figure 2 Broadcast transmission



In Figure 2, only Host B, Host D, and Host E need the information. If the information is broadcast to the subnet, Host A and Host C also receive it. In addition to information security issues, broadcasting to hosts that do not need the information also causes traffic flooding on the same subnet.

Broadcast is disadvantageous in transmitting data to specific hosts. Moreover, broadcast transmission is a significant waste of network resources.

Multicast

Multicast provides point-to-multipoint data transmissions with the minimum network consumption. When some hosts on the network need multicast information, the information sender, or multicast source, sends only one copy of the information. Multicast distribution trees are built through multicast routing protocols, and the packets are replicated only on nodes where the trees branch.

Figure 3 Multicast transmission

In Figure 3, the multicast source sends only one copy of the information to a multicast group. Host B, Host D, and Host E, which are information receivers, must join the multicast group. The routers on the network duplicate and forward the information based on the distribution of the group members. Finally, the information is correctly delivered to Host B, Host D, and Host E.

To summarize, multicast has the following advantages:

- **Advantages over unicast**—Multicast data is replicated and distributed until it flows to the farthest-possible node from the source. The increase of receiver hosts will not remarkably increase the load of the source or the usage of network resources.
- **Advantages over broadcast**—Multicast data is sent only to the receivers that need it. This saves network bandwidth and enhances network security. In addition, multicast data is not confined to the same subnet.

Multicast features

- A multicast group is a multicast receiver set identified by an IP multicast address. Hosts must join a multicast group to become members of the multicast group before they receive the multicast data addressed to that multicast group. Typically, a multicast source does not need to join a multicast group.
- A multicast source is an information sender. It can send data to multiple multicast groups at the same time. Multiple multicast sources can send data to the same multicast group at the same time.
- The group memberships are dynamic. Hosts can join or leave multicast groups at any time. Multicast groups are not subject to geographic restrictions.
- Multicast routers or Layer 3 multicast devices are routers or Layer 3 switches that support Layer 3 multicast. They provide multicast routing and manage multicast group memberships on stub subnets with attached group members. A multicast router itself can be a multicast group member.

For a better understanding of the multicast concept, you can compare multicast transmission to the transmission of TV programs.

Table 1 Comparing TV program transmission and multicast transmission

TV program transmission	Multicast transmission
A TV station transmits a TV program through a channel.	A multicast source sends multicast data to a multicast group.
A user tunes the TV set to the channel.	A receiver joins the multicast group.
The user starts to watch the TV program transmitted by the TV station on the channel.	The receiver starts to receive the multicast data sent by the source to the multicast group.
The user turns off the TV set or tunes to another channel.	The receiver leaves the multicast group or joins another group.

Multicast benefits and applications

Multicast benefits

- **Enhanced efficiency**—Reduces the processor load of information source servers and network devices.
- **Optimal performance**—Reduces redundant traffic.
- **Distributed application**—Enables point-to-multipoint applications at the price of minimum network resources.

Multicast applications

- Multimedia and streaming applications, such as Web TV, Web radio, and real-time video/audio conferencing
- Communication for training and cooperative operations, such as distance learning and telemedicine
- Data warehouse and financial applications (stock quotes)
- Any other point-to-multipoint application for data distribution

Multicast models

Based on how the receivers treat the multicast sources, the multicast models include any-source multicast (ASM), source-filtered multicast (SFM), and source-specific multicast (SSM).

ASM model

In the ASM model, any multicast sources can send information to a multicast group. Receivers can join a multicast group and get multicast information addressed to that multicast group from any multicast sources. In this model, receivers do not know the positions of the multicast sources in advance.

SFM model

The SFM model is derived from the ASM model. To a multicast source, the two models appear to have the same multicast membership architecture.

The SFM model functionally extends the ASM model. The upper-layer software checks the source address of received multicast packets and permits or denies multicast traffic from specific sources.

The receivers obtain the multicast data from only part of the multicast sources. To a receiver, multicast sources are not all valid, but are filtered.

SSM model

The SSM model provides a transmission service that enables multicast receivers to specify the multicast sources in which they are interested.

In the SSM model, receivers have already determined the locations of the multicast sources. This is the main difference between the SSM model and the ASM model. In addition, the SSM model uses a different multicast address range than the ASM/SFM model. Dedicated multicast forwarding paths are established between receivers and the specified multicast sources.

Multicast addresses

IP multicast addresses

IPv4 multicast addresses

IANA assigned the Class D address block (224.0.0.0 to 239.255.255.255) to IPv4 multicast.

Table 2 Class D IP address blocks and description

Address block	Description
224.0.0.0 to 224.0.0.255	Reserved permanent group addresses. The IP address 224.0.0.0 is reserved. Other IP addresses can be used by routing protocols and for topology searching, protocol maintenance, and so on. Table 3 lists common permanent group addresses. A packet destined for an address in this block will not be forwarded beyond the local subnet regardless of the TTL value in the IP header.
224.0.1.0 to 238.255.255.255	Globally scoped group addresses. This block includes the following types of designated group addresses: • **232.0.0.0/8**—SSM group addresses. • **233.0.0.0/8**—Glop group addresses.
239.0.0.0 to 239.255.255.255	Administratively scoped multicast addresses. These addresses are considered locally unique rather than globally unique. You can reuse them in domains administered by different organizations without causing conflicts. For more information, see RFC 2365.

NOTE:

Glop is a mechanism for assigning multicast addresses between different ASs. By filling an AS number into the middle two bytes of 233.0.0.0, you get 255 multicast addresses for that AS. For more information, see RFC 2770.

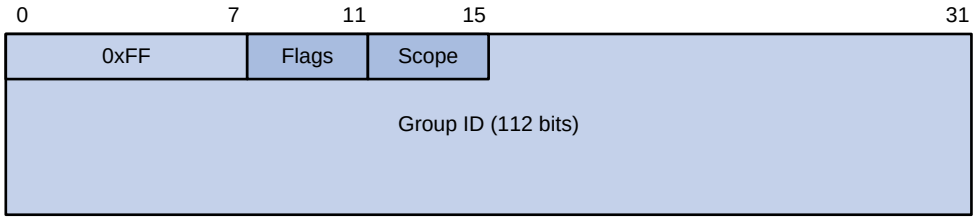


Table 3 Common permanent multicast group addresses

Address	Description
224.0.0.1	All systems on this subnet, including hosts and routers.
224.0.0.2	All multicast routers on this subnet.
224.0.0.3	Unassigned.
224.0.0.4	DVMRP routers.
224.0.0.5	OSPF routers.

Address	Description
224.0.0.6	OSPF designated routers and backup designated routers.
224.0.0.7	Shared Tree (ST) routers.
224.0.0.8	ST hosts.
224.0.0.9	RIPv2 routers.
224.0.0.11	Mobile agents.
224.0.0.12	DHCP server/relay agent.
224.0.0.13	All Protocol Independent Multicast (PIM) routers.
224.0.0.14	RSVP encapsulation.
224.0.0.15	All Core-Based Tree (CBT) routers.
224.0.0.16	Designated SBM.
224.0.0.17	All SBMs.
224.0.0.18	VRRP.

IPv6 multicast addresses

Figure 4 IPv6 multicast format

The following describes the fields of an IPv6 multicast address:

- **0xFF**—The most significant eight bits are 11111111.
- **Flags**—The Flags field contains four bits.

  Figure 5 Flags field format

  Table 4 Flags field description

Bit	Description
0	Reserved, set to 0.
R	• When set to 0, this address is an IPv6 multicast address without an embedded RP address. • When set to 1, this address is an IPv6 multicast address with an embedded RP address. (The P and T bits must also be set to 1.)
P	• When set to 0, this address is an IPv6 multicast address not based on a unicast prefix. • When set to 1, this address is an IPv6 multicast address based on a unicast prefix. (The T bit must also be set to 1.)

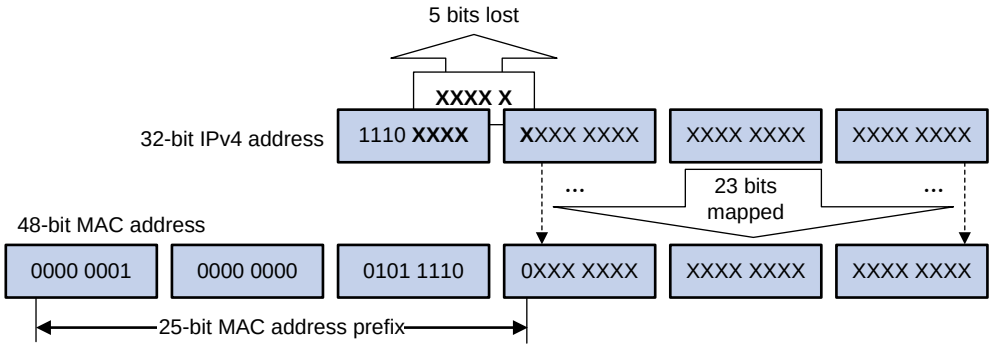
Bit	Description
T	• When set to 0, this address is an IPv6 multicast address permanently-assigned by IANA. • When set to 1, this address is a transient or dynamically assigned IPv6 multicast address.

- **Scope**—The Scope field contains four bits, which represent the scope of the IPv6 internetwork for which the multicast traffic is intended.

  Table 5 Values of the Scope field

Value	Meaning
0, F	Reserved.
1	Interface-local scope.
2	Link-local scope.
3	Subnet-local scope.
4	Admin-local scope.
5	Site-local scope.
6, 7, 9 through D	Unassigned.
8	Organization-local scope.
E	Global scope.

- **Group ID**—The Group ID field contains 112 bits. It uniquely identifies an IPv6 multicast group in the scope that the Scope field defines.



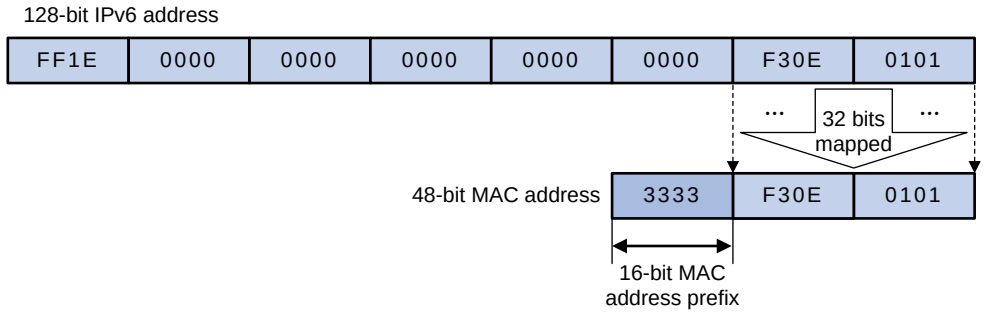
Ethernet multicast MAC addresses

An Ethernet multicast MAC address identifies receivers that belong to the same multicast group at the data link layer.

IPv4 multicast MAC addresses

As defined by IANA, the most significant 24 bits of an IPv4 multicast MAC address are 0x01005E. Bit 25 is 0, and the other 23 bits are the least significant 23 bits of an IPv4 multicast address.

Figure 6 IPv4-to-MAC address mapping



The most significant four bits of an IPv4 multicast address are fixed at 1110. In an IPv4-to-MAC address mapping, five bits of the IPv4 multicast address are lost. As a result, 32 IPv4 multicast addresses are mapped to the same IPv4 multicast MAC address. A device might receive unwanted multicast data at Layer 2 processing, which needs to be filtered by the upper layer.

IPv6 multicast MAC addresses

As defined by IANA, the most significant 16 bits of an IPv6 multicast MAC address are 0x3333. The least significant 32 bits are mapped from the least significant 32 bits of an IPv6 multicast address. Therefore, the problem of duplicate IPv6-to-MAC address mapping also arises like IPv4-to-MAC address mapping.

Figure 7 IPv6-to-MAC address mapping

IMPORTANT:

Because of the duplicate mapping from multicast IP address to multicast MAC address, the device might inadvertently send multicast protocol packets as multicast data in Layer 2 forwarding. To avoid this, do not use the IP multicast addresses that are mapped to multicast MAC addresses 0100-5E00-00xx and 3333-0000-00xx (where "x" represents any hexadecimal number from 0 to F).

Multicast protocols

Multicast protocols include the following categories:

- Layer 3 and Layer 2 multicast protocols:
  - Layer 3 multicast refers to IP multicast operating at the network layer.

    Layer 3 multicast protocols—IGMP, MLD, PIM, IPv6 PIM, MSDP.
  - Layer 2 multicast refers to IP multicast operating at the data link layer.

    Layer 2 multicast protocols—IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.
- IPv4 and IPv6 multicast protocols:
  - **For IPv4 networks**—IGMP snooping, PIM snooping, multicast VLAN, IGMP, PIM, MSDP.
  - **For IPv6 networks**—MLD snooping, IPv6 PIM snooping, IPv6 multicast VLAN, MLD, IPv6 PIM.

This section provides only general descriptions about applications and functions of the Layer 2 and Layer 3 multicast protocols in a network. For more information about these protocols, see the related chapters.

Layer 3 multicast protocols

In Figure 8, Layer 3 multicast protocols include multicast group management protocols and multicast routing protocols.

Figure 8 Positions of Layer 3 multicast protocols

- Multicast group management protocols:

  Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) protocol are multicast group management protocols. Typically, they run between hosts and Layer 3 multicast devices that directly connect to the hosts to establish and maintain multicast group memberships.

- Multicast routing protocols:

  A multicast routing protocol runs on Layer 3 multicast devices to establish and maintain multicast routes and correctly and efficiently forward multicast packets. Multicast routes constitute loop-free data transmission paths (also known as multicast distribution trees) from a data source to multiple receivers.

  In the ASM model, multicast routes include intra-domain routes and inter-domain routes.

  - An intra-domain multicast routing protocol discovers multicast sources and builds multicast distribution trees within an AS to deliver multicast data to receivers. Among a variety of mature intra-domain multicast routing protocols, PIM is most widely used. Based on the forwarding mechanism, PIM has dense mode (often referred to as PIM-DM) and sparse mode (often referred to as PIM-SM).
  - An inter-domain multicast routing protocol is used for delivering multicast information between two ASs. So far, mature solutions include Multicast Source Discovery Protocol (MSDP) and MBGP. MSDP propagates multicast source information among different ASs.

  For the SSM model, multicast routes are not divided into intra-domain routes and inter-domain routes. Because receivers know the positions of the multicast sources, channels established through PIM-SM are sufficient for the transport of multicast information.

Layer 2 multicast protocols

In Figure 9, Layer 2 multicast protocols include IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.

Figure 9 Positions of Layer 2 multicast protocols

- IGMP snooping and MLD snooping:

  IGMP snooping and MLD snooping are multicast constraining mechanisms that run on Layer 2 devices. They manage and control multicast groups by monitoring and analyzing IGMP or MLD messages exchanged between the hosts and Layer 3 multicast devices. This effectively controls the flooding of multicast data in Layer 2 networks.

- PIM snooping and IPv6 PIM snooping:

  PIM snooping and IPv6 PIM snooping run on Layer 2 devices. They work with IGMP snooping or MLD snooping to analyze received PIM messages. Then, they add the ports that are interested in specific multicast data to a PIM snooping routing entry or IPv6 PIM snooping routing entry. In this way, multicast data can be forwarded to only the ports that are interested in the data.

- Multicast VLAN and IPv6 multicast VLAN:

  Multicast VLAN or IPv6 multicast VLAN runs on a Layer 2 device in a multicast network where multicast receivers for the same group exist in different VLANs. With these protocols, the Layer 3 multicast device sends only one copy of multicast to the multicast VLAN or IPv6 multicast VLAN on the Layer 2 device. This method avoids waste of network bandwidth and extra burden on the Layer 3 device.

Multicast packet forwarding mechanism

In a multicast model, receiver hosts of a multicast group are usually located at different areas on the network. They are identified by the same multicast group address. To deliver multicast packets to these receivers, a multicast source encapsulates the multicast data in an IP packet with the multicast group address as the destination address. Multicast routers on the forwarding paths forward multicast packets that an incoming interface receives through multiple outgoing interfaces. Compared to a unicast model, a multicast model is more complex in the following aspects:

- To ensure multicast packet transmission on the network, different routing tables are used to guide multicast forwarding. These routing tables include unicast routing tables, routing tables for multicast, and static multicast routing tables.
- To process the same multicast information from different peers received on different interfaces, the multicast device performs an RPF check on each multicast packet. The RPF check result determines whether the packet will be forwarded or discarded. The RPF check mechanism is the basis for most multicast routing protocols to implement multicast forwarding.

For more information about the RPF mechanism, see "Configuring multicast routing and forwarding" and "Configuring IPv6 multicast routing and forwarding."

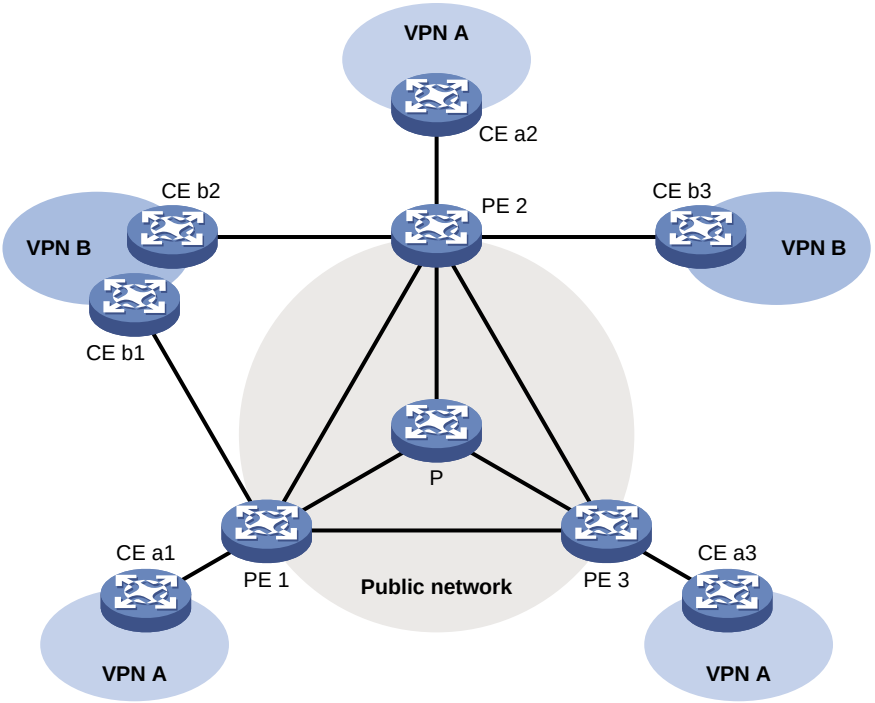
IP multicast architecture

IP multicast addresses the following issues:

- Where should the multicast source transmit information to? (Multicast addressing.)
- What receivers exist on the network? (Host registration.)
- Where is the multicast source that will provide data to the receivers? (Multicast source discovery.)
- How is the information transmitted to the receivers? (Multicast routing.)

IP multicast is an end-to-end service. The multicast architecture involves the following parts:

- **Addressing mechanism**—A multicast source sends information to a group of receivers through a multicast address.
- **Host registration**—Receiver hosts can join and leave multicast groups dynamically. This mechanism is the basis for management of group memberships.
- **Multicast routing**—A multicast distribution tree (a forwarding path tree for multicast data on the network) is constructed for delivering multicast data from a multicast source to receivers.
- **Multicast applications**—A software system that supports multicast applications, such as video conferencing, must be installed on multicast sources and receiver hosts. The TCP/IP stack must support reception and transmission of multicast data.



Multicast support for VPNs

Multicast support for VPNs refers to multicast applied in VPNs.

Introduction to VPN instances

VPNs are isolated from one another and from the public network. As shown in Figure 10, VPN A and VPN B separately access the public network through PE devices.

Figure 10 VPN networking diagram

- The P device belongs to the public network. The CE devices belong to their respective VPNs. Each CE device serves its own VPN and maintains only one set of forwarding mechanisms.
- The PE devices connect to the public network and the VPNs. Each PE device must strictly distinguish the information for different networks, and maintain a separate forwarding mechanism for each network. On a PE device, a set of software and hardware that serve the same network forms an instance. Multiple instances can exist on the same PE device, and an instance can reside on different PE devices. On a PE device, the instance for the public network is called the public network instance, and those for VPNs are called VPN instances.

Multicast application in VPNs

A PE device that supports multicast for VPNs performs the following operations:

- Maintains an independent set of multicast forwarding mechanisms for each VPN, including the multicast protocols, PIM neighbor information, and multicast routing table. In a VPN, the device forwards multicast data based on the forwarding table or routing table for that VPN.
- Implements the isolation between different VPNs.
- Implements information exchange and data conversion between the public network and VPN instances.

For example, as shown in Figure 10, a multicast source in VPN A sends multicast data to a multicast group. Only receivers that belong to both the multicast group and VPN A can receive the multicast data. The multicast data is multicast both in VPN A and on the public network. If you configure MVPN extranet, multicast data can be transmitted across different VPNs.

Common notations in multicast

The following notations are commonly used in multicast transmission:

- **(*, G)**—Rendezvous point tree (RPT), or a multicast packet that any multicast source sends to multicast group G. The asterisk (*) represents any multicast source, and "G" represents a specific multicast group.
- **(S, G)**—Shortest path tree (SPT), or a multicast packet that multicast source "S" sends to multicast group "G." "S" represents a specific multicast source, and "G" represents a specific multicast group.

For more information about the concepts RPT and SPT, see "PIM overview" and "IPv6 PIM overview."

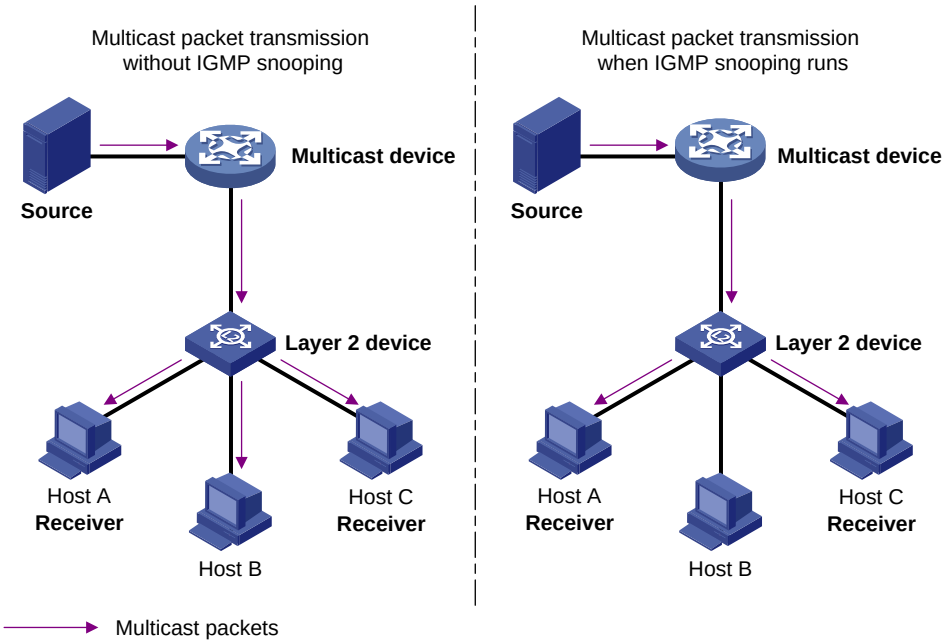
Multicast group policy does not work ····· 40

Configuring IGMP snooping



About IGMP snooping

IGMP snooping runs on a Layer 2 device as a multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from IGMP packets that are exchanged between the hosts and the Layer 3 device.

Fundamentals of IGMP snooping

As shown in Figure 1, when IGMP snooping is not enabled, the Layer 2 switch floods multicast packets to all hosts in a VLAN. When IGMP snooping is enabled, the Layer 2 switch forwards multicast packets of known multicast groups to only the receivers.

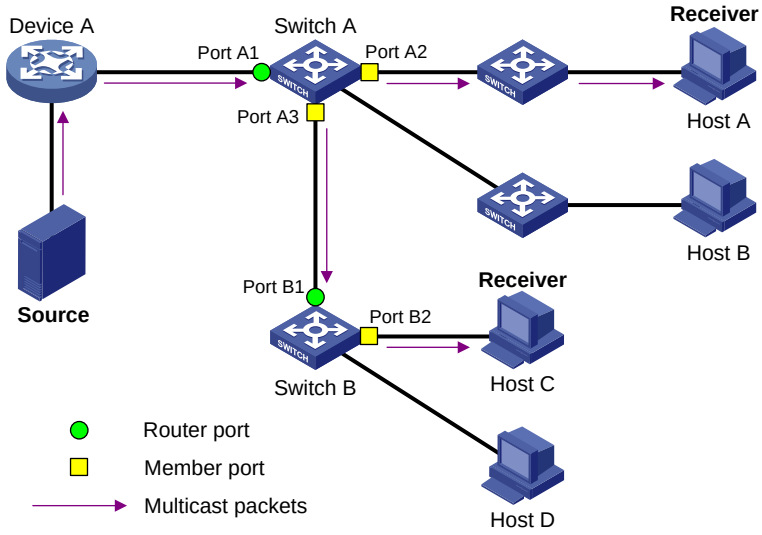


Figure 1 Multicast packet transmission without and with IGMP snooping

IGMP snooping ports

As shown in Figure 2, IGMP snooping runs on Switch A and Switch B, and Host A and Host C are receivers in a multicast group. IGMP snooping ports are divided into member ports and router ports.

Figure 2 IGMP snooping ports

Router ports

On an IGMP snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an IGMP general query whose source address is not 0.0.0.0 or receives a PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive an IGMP general query whose source address or a PIM hello message when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in IGMP snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in IGMP snooping is a Layer 2 interface.

Member ports

On an IGMP snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an IGMP report, it is added to the associated dynamic IGMP snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an IGMP report before the timer expires, the timer is reset. If the port does not receive an IGMP report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static IGMP snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How IGMP snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

IGMP messages types include general query, IGMP report, and leave message. An IGMP snooping-enabled Layer 2 device performs differently depending on the message types.

General query

The IGMP querier periodically sends IGMP general queries to all hosts and devices on the local subnet to check for the existence of multicast group members.

After receiving an IGMP general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

IGMP report

A host sends an IGMP report to the IGMP querier for the following purposes:

- Responds to queries if the host is a multicast group member.
- Applies for a multicast group membership.

After receiving an IGMP report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the address of the reported multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an IGMP report through a non-router port because of the host IGMP report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their IGMP reports upon receiving IGMP reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port.

Leave message

An IGMPv1 receiver host does not send any leave messages when it leaves a multicast group. The Layer 2 device cannot immediately update the status of the port that connects to the receiver host. The Layer 2 device does not remove the port from the outgoing interface list in the associated forwarding entry until the aging time for the group expires.

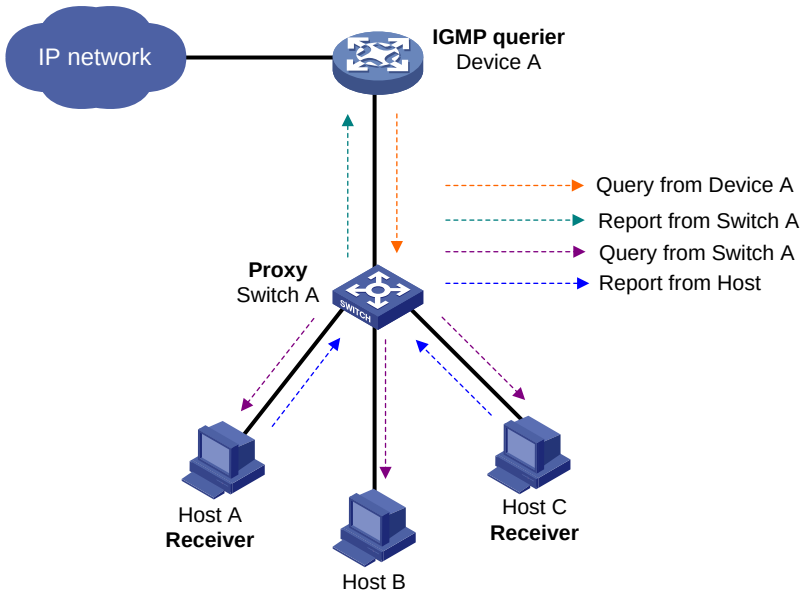
An IGMPv2 or IGMPv3 host sends an IGMP leave message when it leaves a multicast group.

When the Layer 2 device receives an IGMP leave message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the group address in the message.

- If no match is found, the Layer 2 device discards the IGMP leave message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the IGMP leave message.

- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the IGMP leave message.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.
- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the IGMP leave message to all router ports in the VLAN.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.

After receiving the IGMP leave message on a port, the IGMP querier resolves the multicast group address in the message. Then, it sends an IGMP group-specific query to the multicast group through the receiving port.



After receiving the IGMP group-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding IGMP report from the directly connected hosts. For the dynamic member port that received the leave message, the Layer 2 device also performs one of the following actions:

- If the port receives an IGMP report before the aging timer expires, the Layer 2 device resets the aging timer.
- If the port does not receive an IGMP report when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the multicast group.

IGMP snooping proxying

As shown in Figure 3, to reduce the number of IGMP report and leave messages received by the upstream device, you can enable IGMP snooping proxying on the edge device. With IGMP snooping proxying enabled, the edge device acts as a host for the upstream IGMP snooping querier to send IGMP report and leave messages to Device A. The host IGMP report suppression mechanism on the edge device does not take effect. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Figure 3 IGMP snooping proxying

The IGMP snooping proxy device processes different IGMP messages as follows:

- General query.

  After receiving an IGMP general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an IGMP report based on the local membership information and sends the report to all router ports.

- Group-specific query or group-and-source-specific query.

  After receiving an IGMP group-specific query or group-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a report to all router ports in the VLAN.

- Report.

  After receiving an IGMP report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Leave message.

  After receiving the IGMP leave message on a port, the device sends an IGMP group-specific query through the receiving port. The device sends the IGMP leave message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: IGMP snooping configuration

For IGMP reports received from secondary VLANs, the associated IGMP snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable IGMP snooping only for the primary VLAN. The IGMP snooping configuration made in secondary VLANs does not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The IGMP snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in IGMP-snooping view. The configuration made in VLAN view and the configuration made in IGMP-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in IGMP-snooping view. The interface-specific configuration takes priority over the configuration made in IGMP-snooping view.

VLAN-based IGMP snooping tasks at a glance

To configure IGMP snooping for VLANs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for VLANs
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Configuring static multicast MAC address entries
   - Setting the IGMP last member query interval
4. (Optional.) Configuring IGMP snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses
   - Enabling the device to send IGMP general queries upon a path change
   - Enabling the device to send IGMP general queries upon a port state change
6. (Optional.) Enabling IGMP snooping proxying
7. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
8. (Optional.) Configuring IGMP snooping policies
   - Configuring a multicast group policy
   - Enabling multicast source port filtering
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
   - Setting the maximum number of multicast groups on a port
   - Enabling multicast group replacement
   - Enabling host tracking
   - Configuring an IGMP snooping access control policy

9. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
10. (Optional.) Enabling SNMP notifications for IGMP snooping
11. (Optional.) Configuring IGMP snooping logging
    - Enabling IGMP snooping logging
    - Enabling IGMP snooping logging suppression

Enabling the IGMP snooping feature

About this task

You must enable the IGMP snooping feature before you configure other IGMP snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, the IGMP snooping feature is disabled.

Enabling IGMP snooping

Enabling IGMP snooping globally

About this task

After you enable IGMP snooping globally, IGMP snooping is enabled for all VLANs. You can disable IGMP snooping for a VLAN when IGMP snooping is globally enabled.

Restrictions and guidelines

To configure other IGMP snooping features for VLANs, you must enable IGMP snooping for the specific VLANs even though IGMP snooping is enabled globally.

The VLAN-specific IGMP snooping configuration takes priority over the global IGMP snooping configuration. For example, if you enable IGMP snooping globally and then use the **`igmp-snooping disable`** command to disable IGMP snooping for a VLAN, IGMP snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter IGMP-snooping view.
   `igmp-snooping`
3. Enable IGMP snooping globally.
   `global-enable`
   By default, IGMP snooping is disabled globally.
4. (Optional.) Disable IGMP snooping for a VLAN.
   a. Return to system view.
      `quit`
   a. Enter VLAN view.

vlan *vlan-id*

b. Disable IGMP snooping for the VLAN.

igmp-snooping disable

By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for VLANs

Restrictions and guidelines

You can enable IGMP snooping for multiple VLANs by using the **enable vlan** command in IGMP-snooping view or for a VLAN by using the **igmp-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view.

IGMP snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling IGMP snooping for multiple VLANs

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable IGMP snooping for the specified VLANs.

   enable vlan *vlan-list*

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Configuring basic IGMP snooping features

Specifying an IGMP snooping version

About this task

Different IGMP snooping versions process different versions of IGMP messages.

- IGMPv2 snooping processes IGMPv1 messages, IGMPv2 messages, and IGMPv3 queries, but it floods IGMPv3 reports in the VLAN instead of processing them.
- IGMPv3 snooping processes IGMPv1, IGMPv2, and IGMPv3 messages.

Restrictions and guidelines

If you change the IGMP snooping version from 2 to 3, the device performs the following actions:

- Clears all IGMP snooping forwarding entries that are dynamically created.
- Keeps static IGMPv3 snooping forwarding entries (*, G).
- Clears static IGMPv3 snooping forwarding entries (S, G), which will be restored when the IGMP snooping version is switched back to 3.

For more information about static IGMP snooping forwarding entries, see "Configuring a static member port."

Specifying an IGMP snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Specify an IGMP snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an IGMP snooping version for the VLAN.
   igmp-snooping version *version-number*
   By default, the IGMP snooping version for a VLAN is 2.

Setting the maximum number of IGMP snooping forwarding entries

About this task

You can modify the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum number of IGMP snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of IGMP snooping forwarding entries is 4294967295.

Configuring static multicast MAC address entries

About this task

In Layer 2 multicast, multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as IGMP snooping). You can also manually configure static multicast MAC address entries by binding multicast MAC addresses and ports to control the destination ports of the multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the IGMP last member query interval

About this task

A receiver host starts a report delay timer for a multicast group when it receives an IGMP group-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the group.

The IGMP last member query interval defines the maximum response time advertised in IGMP group-specific queries. Set an appropriate value for the IGMP last member query interval to speed up hosts' responses to IGMP group-specific queries and avoid IGMP report traffic bursts.

Setting the IGMP last member query interval globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the IGMP last member query interval globally.
   last-member-query-interval *interval*

By default, the global IGMP last member query interval is 1 second.

Setting the IGMP last member query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP last member query interval for the VLAN.
   igmp-snooping last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second for a VLAN.

Configuring IGMP snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an IGMP general query or PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an IGMP report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports. For example, if the memberships of multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports. If the memberships of multicast groups rarely change, set a relatively large value.

If a dynamic router port receives a PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **router-aging-time** or **igmp-snooping router-aging-time** command does not take effect on the port.

IGMP group-specific queries originated by the Layer 2 device trigger the adjustment of aging timers for dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the IGMP last member query interval. For more information about setting the IGMP last member query interval on the Layer 2 device, see "Setting the IGMP last member query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the global aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view

2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   igmp-snooping router-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic router ports.
4. Set the aging timer for dynamic member ports in the VLAN.
   igmp-snooping host-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for a multicast group so that hosts attached to the port can always receive multicast for the group. The static member port does not respond to IGMP queries. When you complete or cancel this configuration on a port, the port does not send an unsolicited IGMP report or leave message.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.
   igmp-snooping static-group *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*
   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for a multicast group so that all multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.
   igmp-snooping static-router-port vlan *vlan-id*

By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited IGMP report when you complete the configuration.
- It responds to IGMP general queries with IGMP reports.
- It sends an IGMP leave message when you cancel the configuration.

The version of IGMP running on the simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave massage. The Layer 2 device no longer sends or forwards IGMP group-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts in a VLAN. If you do so, the remaining receivers cannot receive multicast data for a group after a receiver leaves the group.

On a network where both Layer 2 multicast and Layer 3 multicast are enabled, when multicast group members on a port need to leave, you only need to enable fast-leave processing on the Layer 2 port. To avoid multicast service interruption on the other ports in the same VLAN, do not enable fast-leave processing for Layer 3 multicast group members at the same time (by using the **igmp fast leave** command). For more information about the **igmp fast leave** command, see IGMP commands in *IP Multicast Command Reference*.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping

3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   igmp-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send IGMP general queries or PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive multicast data that it does not want to receive.
- The port forwards the IGMP general queries or PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the IGMP querier or M-LAG election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable a port from becoming a dynamic router port. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   igmp-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an IGMP snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable IGMP snooping in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   igmp-snooping router-port-discard
   By default, the device forwards multicast data to static router ports in a VLAN.

Configuring the IGMP snooping querier

Enabling the IGMP snooping querier

About this task

This feature enables the Layer 2 device to periodically send IGMP general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an IGMP snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the IGMP snooping querier on a multicast network that runs IGMP. An IGMP snooping querier does not take part in IGMP querier elections. However, it might affect IGMP querier elections if it sends IGMP general queries with a low source IP address.

Enabling the IGMP snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the IGMP snooping querier for the VLAN.
   igmp-snooping querier
   By default, the IGMP snooping querier is disabled for a VLAN.

Enabling IGMP snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for IGMP snooping querier election is the same as that for IGMP querier election. For more information about IGMP querier election, see "Configuring IGMP."

Prerequisites for enabling IGMP snooping querier election

Before you enable IGMP snooping querier election, you must complete the following tasks:

- Enable the IGMP snooping querier for a VLAN. For more information about enabling the IGMP snooping querier, see "Enabling the IGMP snooping querier."
- Configure the source IP address for IGMP general queries as an IP address different from 0.0.0.0 and the local querier IP address. An IGMP snooping querier performs querier election only if the source IP address of a received IGMP general query is not 0.0.0.0 or its own IP address.
- Make sure the candidate IGMP snooping queriers run the same IGMP snooping version. To specify the IGMP snooping version, use the **igmp-snooping version** command.

Enabling IGMP snooping querier election for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable IGMP snooping querier election for the VLAN.

   igmp-snooping querier-election

   By default, IGMP snooping querier election is disabled for a VLAN.

Configuring parameters for IGMP general queries and responses

About this task

You can modify the IGMP general query interval based on the actual condition of the network.

A receiver host starts a report delay timer for each multicast group that it has joined when it receives an IGMP general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the corresponding multicast group.

Set an appropriate value for the maximum response time for IGMP general queries to speed up hosts' responses to IGMP general queries and avoid IGMP report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting multicast group members, make sure the IGMP general query interval is greater than the maximum response time for IGMP general queries.

Configuring parameters for IGMP general queries and responses globally

1. Enter system view.

   system-view
2. Enter IGMP-snooping view.

igmp-snooping

3. Set the maximum response time for IGMP general queries.

   max-response-time *seconds*

   By default, the maximum response time for IGMP general queries is 10 seconds.

Configuring parameters for IGMP general queries and responses in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the IGMP general query interval in the VLAN.

   igmp-snooping query-interval *interval*

   By default, the IGMP general query interval is 125 seconds for a VLAN.

4. Set the maximum response time for IGMP general queries in the VLAN.

   igmp-snooping max-response-time *seconds*

   By default, the maximum response time for IGMP general queries is 10 seconds for a VLAN.

Enabling the device to send IGMP general queries upon a path change

About this task

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when a path changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the IGMP snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

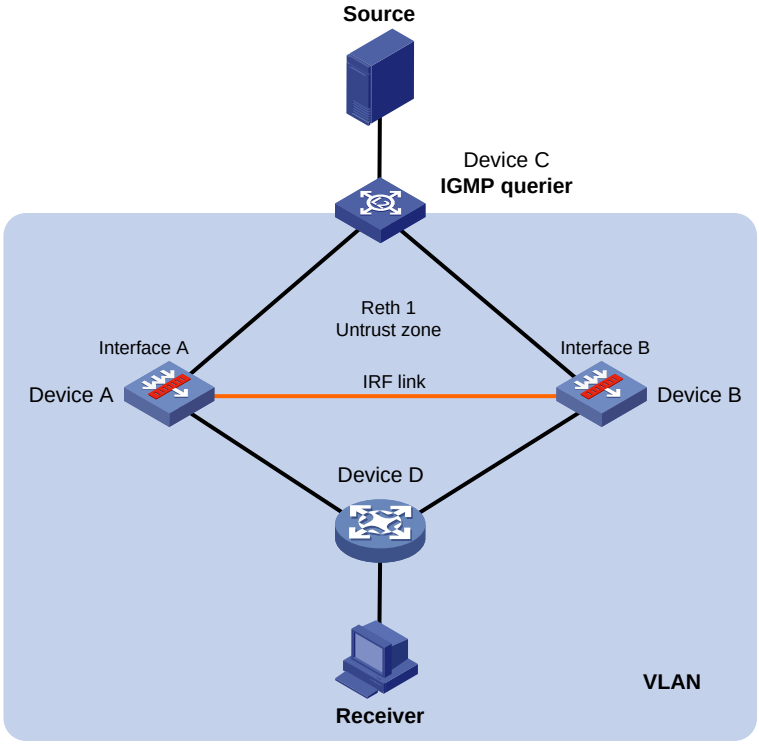
   igmp-snooping

3. Enable the device to send IGMP general queries upon a path change.

   send-query enable

   By default, the device does not send IGMP general queries upon a path change.

Enabling the device to send IGMP general queries upon a port state change



About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an IGMP general query immediately and cannot update

interface B to multicast forwarding entries. For information about Reth interfaces, see *High Availability Configuration Guide*.

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send IGMP general queries upon a port state change.
   igmp-snooping triggered-query enable { **port-down** | **port-up** } *
   By default, the device does not send IGMP general queries upon a port state change.

Enabling IGMP snooping proxying

About enabling IGMP snooping proxying

The device enabled with IGMP snooping proxying is called an IGMP snooping proxy. The IGMP snooping proxy acts as a host to the upstream device. Enabled with IGMP snooping querier, the IGMP snooping proxy acts as the router to downstream devices and receives report and leave messages on behalf of the upstream device. As a best practice, enable IGMP snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling IGMP snooping proxying

Before you enable IGMP snooping proxying for a VLAN, you must first enable IGMP snooping globally and enable IGMP snooping for the VLAN. IGMP snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with IGMP snooping querier. For more information about enabling IGMP snooping querier, see "Enabling the IGMP snooping querier."

Enabling IGMP snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping proxying for the VLAN.
   igmp-snooping proxy enable
   By default, IGMP snooping proxying is disabled for a VLAN.

Configuring parameters for IGMP messages

Configuring source IP addresses for IGMP messages

About this task

The IGMP snooping querier might send IGMP general queries with the source IP address 0.0.0.0. The port that receives such queries will not be maintained as a dynamic router port. This might prevent the associated dynamic IGMP snooping forwarding entry from being correctly created at the data link layer and eventually cause multicast traffic forwarding failures. To avoid this problem, you can configure a non-all-zero IP address as the source IP address of the IGMP queries on the IGMP snooping querier. This configuration might affect the IGMP querier election within the subnet.

You can also change the source IP address of IGMP reports or leave messages sent by a simulated member host or an IGMP snooping proxy.

Configuring the source IP addresses for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Configure the source IP address for IGMP general queries.
   igmp-snooping general-query source-ip *ip-address*
   By default, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.
4. Configure the source IP address for IGMP group-specific queries.
   igmp-snooping special-query source-ip *ip-address*
   By default, the source IP address of IGMP group-specific queries is one of the following:

- The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
- The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
- 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

   By default, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

Setting the 802.1p priority for IGMP messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards IGMP messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to IGMP messages that are created or forwarded by the device.

Setting the 802.1p priority for IGMP messages globally

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Set the 802.1p priority for IGMP messages.

   dot1p-priority *priority*

   By default, the global 802.1p priority is not set.

Setting the 802.1p priority for IGMP messages in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the 802.1p priority for IGMP messages in the VLAN.

   igmp-snooping dot1p-priority *priority*

   By default, the 802.1p priority is not set.

Configuring IGMP snooping policies

Configuring a multicast group policy

About this task

This feature enables the Layer 2 device to filter IGMP reports by using an ACL that specifies the multicast groups and the optional sources. It is used to control the multicast groups that hosts can join. This configuration takes effect only on the multicast groups that ports join dynamically.

In a multicast application, a host sends an unsolicited IGMP report when a user requests a multicast program. The Layer 2 device uses the multicast group policy to filter the IGMP report. The host can join the multicast group only if the IGMP report is permitted by the multicast group policy.

Configuring a multicast group policy globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Configure a multicast group policy globally.
   group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured, and hosts can join any multicast groups.

Configuring a multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a multicast group policy on the port.
   igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured on a port, and hosts attached to the port can join any multicast groups.

Enabling multicast source port filtering

About this task

This feature enables the Layer 2 device to discard all multicast data packets and to accept multicast protocol packets. You can enable this feature on ports that connect only to multicast receivers.

Restrictions and guidelines

The configuration made for multiple interfaces in IGMP-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling multicast source port filtering in IGMP-snooping view

1. Enter system view.
   system-view

2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast source port filtering.
   source-deny port *interface-list*
   By default, multicast source port filtering is disabled.

Enabling multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable multicast source port filtering.
   igmp-snooping source-deny
   By default, multicast source port filtering is disabled.

Enabling dropping unknown multicast data

About this task

Unknown multicast data refers to multicast data for which no forwarding entries exist in the IGMP snooping forwarding table. This feature enables the device to forward unknown multicast data only to the router port. If the device does not have a router port, unknown multicast data will be dropped.

If you do not enable this feature, the unknown multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv4 multicast data is enabled, the device also drops unknown IPv6 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown multicast data out of router ports except the receiving router port in this VLAN.

Enabling dropping unknown multicast data for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable dropping unknown multicast data for the VLAN.
   igmp-snooping drop-unknown
   By default, dropping unknown multicast data is disabled for a VLAN. Unknown multicast data is flooded in the VLAN.

Enabling IGMP report suppression

About this task

This feature enables the Layer 2 device to forward only the first IGMP report for a multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable IGMP report suppression.
   report-aggregation
   By default, IGMP report suppression is enabled.

Setting the maximum number of multicast groups on a port

About this task

You can set the maximum number of multicast groups on a port to regulate the port traffic. This feature takes effect only on the multicast groups that a port joins dynamically.

If the number of multicast groups on a port exceeds the limit, the system removes all the forwarding entries associated with the port. The receiver hosts attached to that port can join multicast groups again before the number of multicast groups on the port reaches the limit. When the number of multicast groups on the port reaches the limit, the port automatically drops IGMP reports for new groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of multicast groups on the port.
   igmp-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of multicast groups on a port.

Enabling multicast group replacement

About this task

When multicast group replacement is enabled, the port does not drop IGMP reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves the multicast group that has the lowest IP address and joins the new group contained in the IGMP report. The multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that a port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the IGMP snooping forwarding entries on the device reaches the upper limit.
- The multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling multicast group replacement globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled globally.

Enabling multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable multicast group replacement on the port.
   igmp-snooping overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving multicast data. The information includes IP addresses of the hosts, length of time elapsed since the hosts joined multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   igmp-snooping host-tracking
   By default, host tracking is disabled for a VLAN.

Configuring an IGMP snooping access control policy

About this task

This feature enables the device to use ACLs to filter IGMP reports and leave messages from multicast users. Multicast users can join or leave only multicast groups permitted by the IGMP snooping access control policies.

Procedure

1. Enter system view.

   system-view
2. Enter user profile view.

   user-profile *profile-name*

   For more information about this command, see user profile commands in *Security Command Reference*.
3. Configure an IGMP snooping access control policy.

   igmp-snooping access-policy *ipv4-acl-number*

   By default, no IGMP snooping access control policies are configured. Multicast users can join or leave any multicast groups.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view
2. Enter IGMP snooping view.

   igmp-snooping
3. Set the DSCP value for outgoing IGMP protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP snooping

About this task

To report critical IGMP snooping events to an SNMP NMS, enable SNMP notifications for IGMP snooping.

For IGMP snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.

system-view

2. Enable SNMP notifications for IGMP snooping.

   snmp-agent trap enable igmp-snooping [**entry-refresh-failed**]

   By default, SNMP notifications are enabled for IGMP snooping.

Configuring IGMP snooping logging

Enabling IGMP snooping logging

About this task

This feature enables the IGMP snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable IGMP snooping logging or use the **igmp-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.

   system-view

2. Enter IGMP snooping view.

   igmp-snooping

3. Enable IGMP snooping logging.

   igmp-snooping log enable [**group**]

   By default, IGMP snooping logging is enabled.

Enabling IGMP snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the IGMP snooping module to the information center.

Procedure

1. Enter system view.

   system-view

2. Enter IGMP snooping view.

   igmp-snooping

3. Enable IGMP snooping logging suppression.

   igmp-snooping log suppress [**group**]

   By default, IGMP snooping logging suppression is enabled.

Display and maintenance commands for IGMP snooping

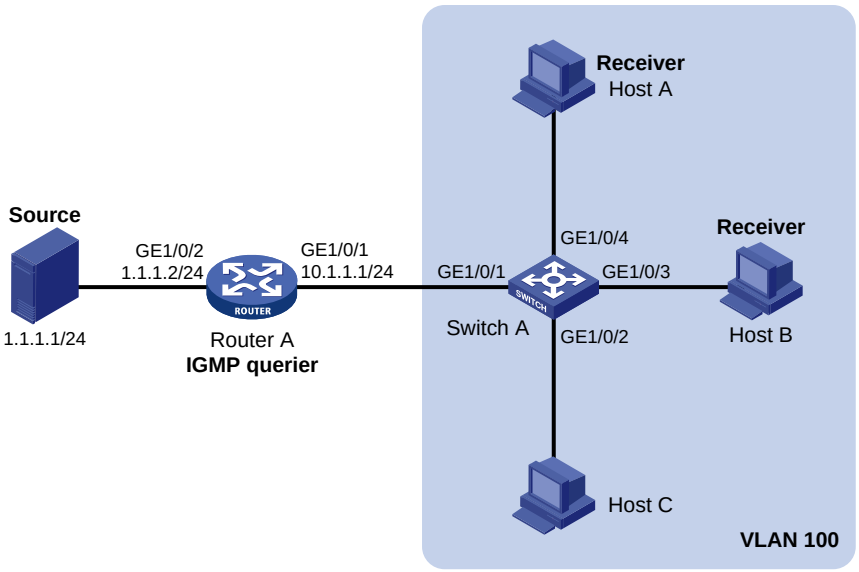
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IGMP snooping status.	**display igmp-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic IGMP snooping group entries.	**display igmp-snooping group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display igmp-snooping host-tracking vlan** *vlan-id* **group** *group-address* [**source** *source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display igmp-snooping router-port** [**vlan** *vlan-id* [**verbose**] [**slot** *slot-number*]
Display static IGMP snooping group entries.	**display igmp-snooping static-group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display igmp-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the IGMP messages and PIMv2 hello messages learned by IGMP snooping.	**display igmp-snooping statistics**
Display Layer 2 multicast fast forwarding entries.	**display l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*source-address* | *group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IP multicast groups.	**display l2-multicast ip** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IP multicast group entries.	**display l2-multicast ip forwarding** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 MAC multicast groups.	**display l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 MAC multicast group entries.	**display l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Clear dynamic IGMP snooping group entries.	**reset igmp-snooping group** { *group-address*

Task	Command
	[*source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset igmp-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping.	**reset igmp-snooping statistics**
Clear Layer 2 multicast fast forwarding entries.	**reset l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]

IGMP snooping configuration examples

Example: Configuring VLAN-based IGMP snooping group polices and simulated joining



Network configuration

As shown in Figure 5, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping.

Configure a multicast group policy and simulated joining to meet the following requirements:

- Host A and Host B receive only the multicast data addressed to multicast group 224.1.1.1. Multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

```
<RouterA> system-view
[RouterA] multicast routing
[RouterA-mrib] quit
```

   # Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] igmp enable
[RouterA-GigabitEthernet1/0/1] quit
```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping drop-unknown
[SwitchA-vlan100] quit
```

   # Configure a multicast group policy so that hosts in VLAN 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] group-policy 2001 vlan 100
[SwitchA-igmp-snooping] quit
```

   # Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts of multicast group 224.1.1.1.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.2.2.2. (Details not shown.)

Display dynamic IGMP snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

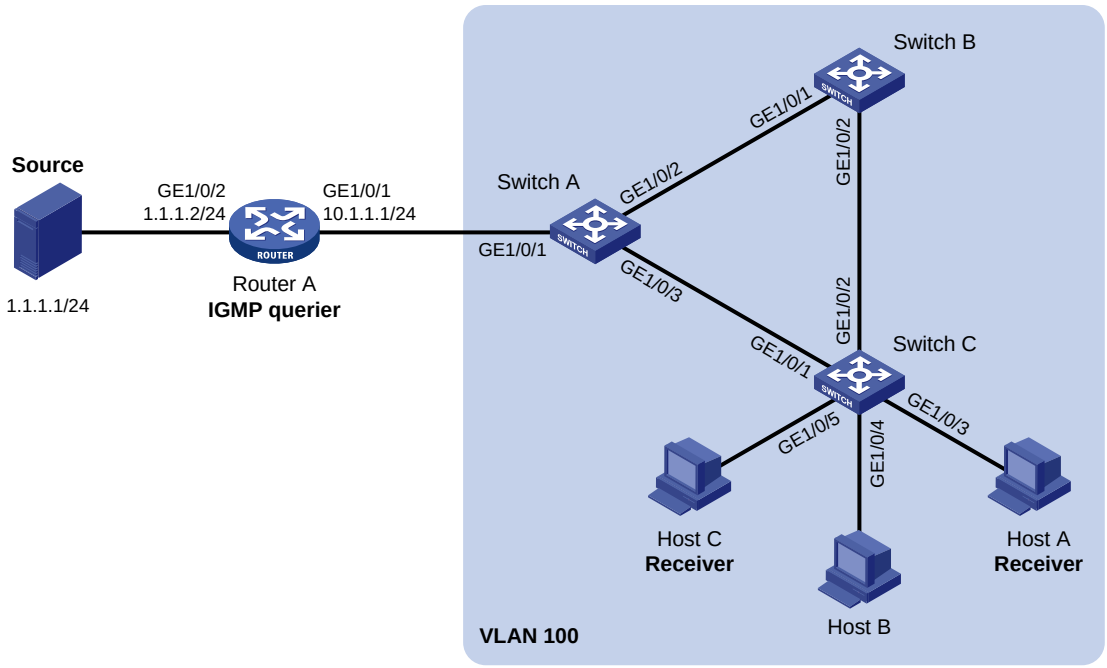
The output shows the following information:

- Host A and Host B have joined multicast group 224.1.1.1 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join multicast group 224.2.2.2.

Example: Configuring VLAN-based IGMP snooping static ports

Network configuration

As shown in Figure 6:



- Router A runs IGMPv2 and acts as the IGMP querier. Switch A, Switch B, and Switch C run IGMPv2 snooping.
- Host A and host C are permanent receivers of multicast group 224.1.1.1.

Configure static ports to meet the following requirements:

- To enhance the reliability of multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for multicast group 224.1.1.1.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. Multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one IGMP query-response cycle must be completed before multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, multicast data can flow to the receivers nearly uninterruptedly along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 6.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   ```

```
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable IGMP snooping for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable IGMP snooping for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for multicast group 224.1.1.1.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static IGMP snooping group entries for VLAN 100 on Switch C.

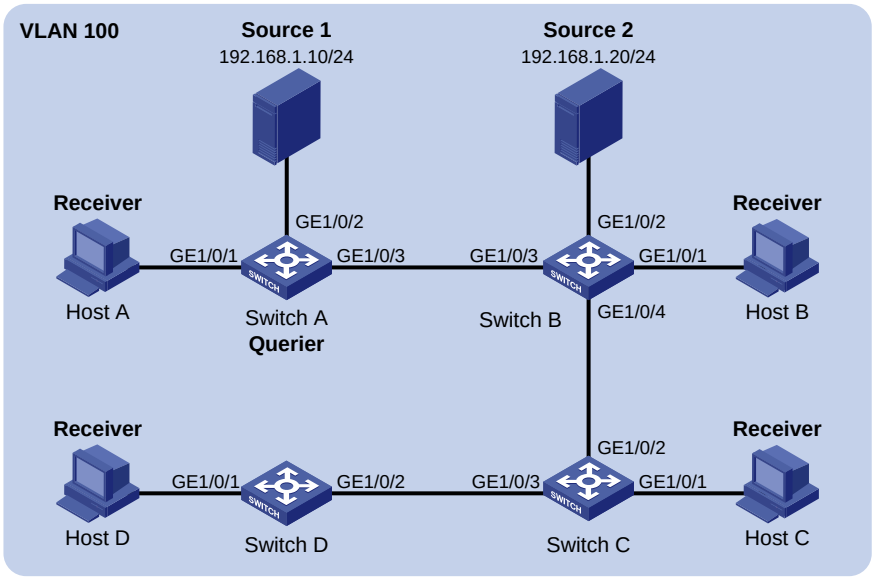
```
[SwitchC] display igmp-snooping static-group vlan 100
Total 1 entries.
```

```
VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of multicast group 224.1.1.1.

Example: Configuring the VLAN-based IGMP snooping querier

Network configuration



As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Host A and Host C are receivers of multicast group 224.1.1.1, and Host B and Host D are receivers of multicast group 225.1.1.1.
- All host receivers run IGMPv2, and all switches run IGMPv2 snooping. Switch A (which is close to the multicast sources) acts as the IGMP snooping querier.

Configure the switches to meet the following requirements:

- To prevent the switches from flooding unknown data in the VLAN, enable all the switches to drop unknown multicast data.
- A switch does not mark a port that receives an IGMP query with source IP address 0.0.0.0 as a dynamic router port. This adversely affects the establishment of Layer 2 forwarding entries and multicast traffic forwarding. To avoid this, configure the source IP address of IGMP queries as a non-zero IP address.

Figure 7 Network diagram

Procedure

1. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping drop-unknown
```

Configure Switch A as the IGMP snooping querier.

```
[SwitchA-vlan100] igmp-snooping querier
[SwitchA-vlan100] quit
```

In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP general queries.

```
[SwitchA-vlan100] igmp-snooping general-query source-ip 192.168.1.1
```

In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP group-specific queries.

```
[SwitchA-vlan100] igmp-snooping special-query source-ip 192.168.1.1
[SwitchA-vlan100] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] igmp-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] igmp-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the IGMP snooping feature.

```
<SwitchD> system-view
[SwitchD] igmp-snooping
[SwitchD-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

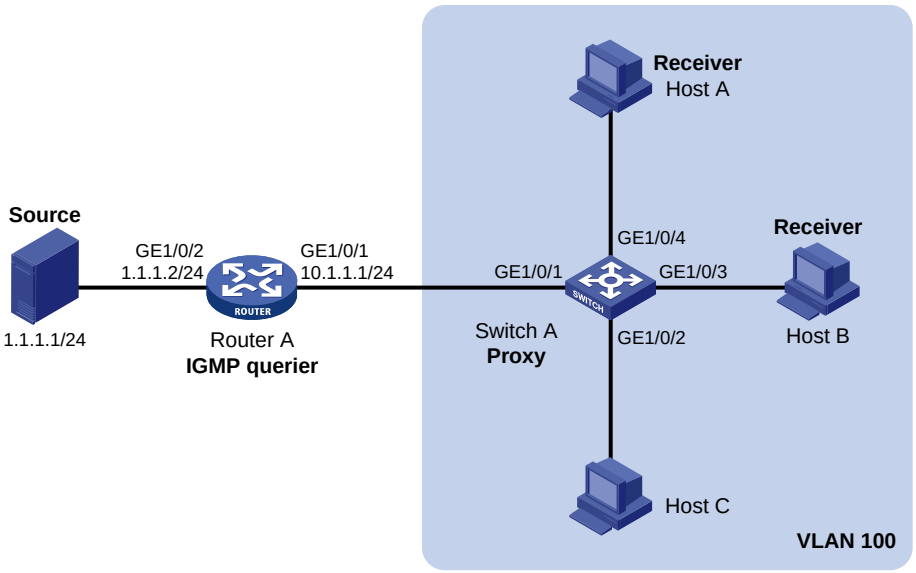
```
[SwitchD-vlan100] igmp-snooping enable
[SwitchD-vlan100] igmp-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping on Switch B.

```
[SwitchB] display igmp-snooping statistics
Received IGMP messages:
  IGMP general queries: 19
  IGMPv2 specific queries: 10
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
  IGMPv1 reports: 0
  IGMPv2 reports: 19
  IGMPv3 reports: 0
  IGMPv3 reports with right and wrong records: 0
  IGMP leaves: 5
  Error IGMP messages: 1
Sent IGMP messages:
  IGMPv2 specific queries: 0
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
Received PIMv2 hello : 0
```

The output shows that all switches except Switch A can receive the IGMP general queries after Switch A acts as the IGMP snooping querier.



Example: Configuring VLAN-based IGMP snooping proxying

Network configuration

As shown in Figure 8, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping. Configure IGMP snooping proxying so that Switch A can perform the following actions:

- Forward IGMP report and leave messages to Router A.
- Respond to IGMP queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 8.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP and PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping and IGMP snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping proxy enable
   ```

```
[SwitchA-vlan100] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:00)
      GE1/0/4                                  (00:04:04)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of multicast group 224.1.1.1. Host A and Host B become receivers of the group.

Display IGMP group membership information on Router A.

```
[RouterA] display igmp group
IGMP groups in total: 1
 GigabitEthernet1/0/1(10.1.1.1):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   224.1.1.1       0.0.0.0         00:00:31    00:02:03
```

Send an IGMP leave message from Host A to leave multicast group 224.1.1.1. (Details not shown.)

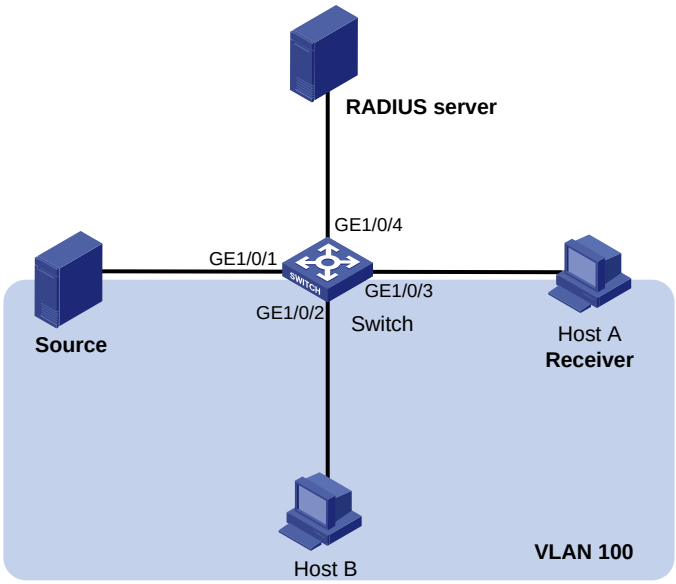
Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1. Only Host B remains as the receiver of the group.

Example: Configuring a VLAN-based IGMP snooping access policy



Network configuration

As shown in Figure 9:

- The switch runs IGMPv2 snooping.
- The switch performs 802.1X authentication for Host A and Host B.

Configure an IGMP snooping access group policy on the switch so that Host A can join or leave only multicast group 224.1.1.1.

Figure 9 Network diagram

Configuring the switch

1. Configure IGMP snooping.

   # Enable the IGMP snooping feature.

   ```
   <Switch> system-view
   [Switch] igmp-snooping
   [Switch-igmp-snooping] quit
   ```

   # Create VLAN 100 and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [Switch] vlan 100
   [Switch-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping for VLAN 100.

   ```
   [Switch-vlan100] igmp-snooping enable
   [Switch-vlan100] quit
   ```

   # Configure an IGMP snooping access policy.

   ```
   [Switch] acl basic 2001
   [Switch-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
   [Switch-acl-ipv4-basic-2001] quit
   [Switch] user-profile profile2
   [Switch-user-profile-profile2] igmp-snooping access-policy 2001
   [Switch-user-profile-profile2] quit
   ```

2. Configure a RADIUS scheme.

   # Create a RADIUS scheme named **scheme2**.

   ```
   [Switch] radius scheme scheme2
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-scheme2] primary authentication 3.1.1.1
   [Switch-radius-scheme2] key authentication simple 321123
   [Switch-radius-scheme2] primary accounting 3.1.1.1
   [Switch-radius-scheme2] key accounting simple 321123
   ```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-scheme2] user-name-format without-domain
[Switch-radius-scheme2] quit
```

3. Configure an ISP domain.

Create an ISP domain named **domain2**.

```
[Switch] domain domain2
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-domain2] authorization-attribute user-profile profile2
[Switch-isp-domain2] authentication lan-access radius-scheme scheme2
[Switch-isp-domain2] authorization lan-access radius-scheme scheme2
[Switch-isp-domain2] accounting lan-access radius-scheme scheme2
[Switch-isp-domain2] quit
```

Configure domain **domain2** as the default ISP domain.

```
[Switch] domain default enable domain2
```

4. Configure 802.1X authentication.

Enable 802.1X authentication on GigabitEthernet 1/0/2.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] dot1x
[Switch-GigabitEthernet1/0/2] quit
```

Enable 802.1X authentication on GigabitEthernet 1/0/3.

```
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] dot1x
[Switch-GigabitEthernet1/0/3] quit
```

Enable 802.1X authentication globally.

```
[Switch] dot1x
```

Configuring the RADIUS server

Configure the RADIUS server properly to provide authentication and accounting functions. (Details not shown.)

Verifying the configuration

Display dynamic IGMP snooping group entries for VLAN 100.

```
[Switch] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (1 in total):
      GE1/0/3                                  (00:03:05)
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1.

Troubleshooting IGMP snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function on the Layer 2 device.

Solution

To resolve the problem:

1. Use the **display igmp-snooping** command to display IGMP snooping status.
2. If IGMP snooping is not enabled, use the **igmp-snooping** command in system view to enable the IGMP snooping feature. Then, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
3. If IGMP snooping is enabled globally but not enabled for the VLAN, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Multicast group policy does not work

Symptom

Hosts can receive multicast data for multicast groups that are not permitted by the multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl** command to verify that the configured ACL meets the multicast group policy requirements.
2. Use the **display this** command in IGMP-snooping view or in a corresponding interface view to verify that the correct multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **igmp-snooping group-policy** command to apply the correct multicast group policy.
3. Use the **display igmp-snooping** command to verify that dropping unknown multicast data is enabled. If it is not, use the **igmp-snooping drop-unknown** command to enable dropping unknown multicast data.
4. If the problem persists, contact H3C Support.

Configuring PIM snooping

About PIM snooping

PIM snooping runs on Layer 2 devices. It works with IGMP snooping to analyze received PIM messages, and adds the ports that are interested in specific multicast data to a PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the PIM routers are in the same VLAN.

- When the Layer 2 switch runs only IGMP snooping, it performs the following actions:
  - **a.** Maintains the router ports according to the received PIM hello messages that PIM routers send.
  - **b.** Floods all other types of received PIM messages except PIM hello messages in the VLAN.
  - **c.** Forwards all multicast data to all router ports in the VLAN.

Each PIM router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all PIM messages except PIM hello messages.

- When the Layer 2 switch runs both IGMP snooping and PIM snooping, it performs the following actions:
  a. Examines whether a PIM router is interested in the multicast data addressed to a multicast group according to the received PIM messages that the router sends.
  b. Adds only the ports that connect to the router and are interested in the data to a PIM snooping routing entry.
  c. Forwards PIM messages and multicast data to only the routers that are interested in the data, which saves network bandwidth.

For more information about IGMP snooping and the router port, see "Configuring IGMP snooping."

Restrictions and guidelines: PIM snooping configuration

PIM snooping does not take effect on secondary VLANs. As a best practice, do not configure PIM snooping for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of a PIM join or prune message is smaller than the path MTU of devices connected to PIM snooping devices. Otherwise, fragmented PIM join or prune messages prevent PIM snooping from correctly forwarding multicast data.

PIM snooping is supported only for PIM-SM and PIM-SSM. As a best practice, do not configure PIM snooping for PIM-DM and BIDIR-PIM.

After you configure PIM snooping for a VLAN, PIM snooping takes effect only on ports that belong to the VLAN.

PIM snooping tasks at a glance

To configure PIM snooping, perform the following tasks:

1. Enabling PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling PIM snooping

Restrictions and guidelines

You must enable the IGMP snooping feature and enable IGMP snooping for a VLAN before you enable PIM snooping for the VLAN.

PIM snooping does not take effect on sub-VLANs of a multicast VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`

By default, IGMP snooping is disabled.

For more information about this command, see IGMP snooping commands in *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter VLAN view.

   vlan *vlan-id*

5. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, IGMP snooping is disabled in a VLAN.

   For more information about this command, see *IP Multicast Command Reference*.

6. Enable PIM snooping for the VLAN.

   pim-snooping enable

   By default, PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 multicast data interruption caused by the aging of PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives a PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives a PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.
   pim-snooping graceful-restart join-aging-time *seconds*
   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for PIM snooping

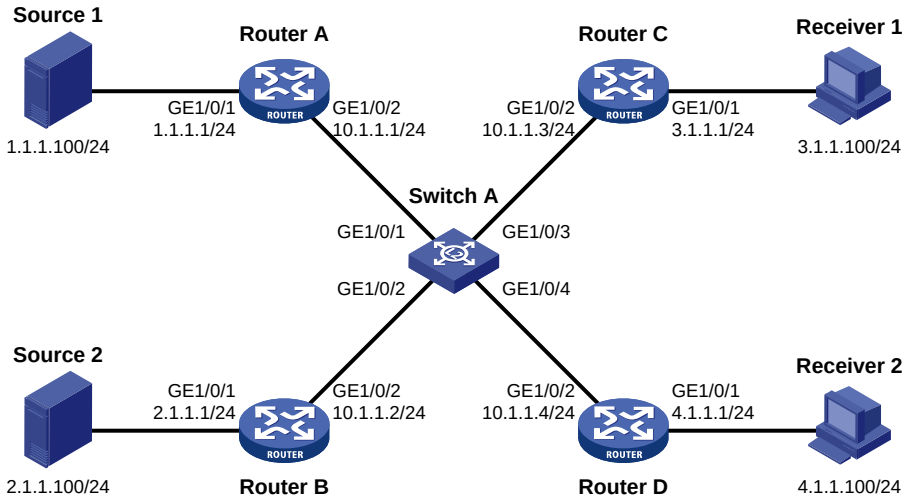
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PIM snooping neighbor information.	**display pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping router port information.	**display pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping routing entries.	**display pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the PIM messages learned through PIM snooping.	**display pim-snooping statistics**
Clear statistics for the PIM messages learned through PIM snooping.	**reset pim-snooping statistics**

PIM snooping configuration examples

Example: Configuring PIM snooping

Network configuration



As shown in Figure 2:

- OSPF runs on the network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Receiver 1 and Receiver 2 belong to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Router C and Router D run IGMP on GigabitEthernet 1/0/1. Router A, Router B, Router C, and Router D run PIM-SM.

- GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure IGMP snooping and PIM snooping on Switch A. Then, Switch A forwards PIM protocol packets and multicast data packets only to the routers that are connected to receivers.

Figure 2 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 2, and configure OSPF on the routers.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] pim
   [RouterA-pim] c-bsr 10.1.1.1
   [RouterA-pim] c-rp 10.1.1.1
   [RouterA-pim] quit
   ```

2. Configure Router B:

   # Enable IP multicast routing.

   ```
   <RouterB> system-view
   [RouterB] multicast routing
   [RouterB-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterB] interface gigabitethernet 1/0/1
   ```

```
[RouterB-GigabitEthernet1/0/1] pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IP multicast routing.

```
<RouterC> system-view
[RouterC] multicast routing
[RouterC-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] igmp enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IP multicast routing.

```
<RouterD> system-view
[RouterD] multicast routing
[RouterD-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] igmp enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and PIM snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display pim-snooping neighbor vlan 100
```

```
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  10.1.1.1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  10.1.1.2
    Ports (1 in total):
      GE1/0/2                 (00:32:43)
  10.1.1.3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  10.1.1.4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are PIM snooping neighbors.

On Switch A, display PIM snooping routing entries for VLAN 100.

```
[SwitchA] display pim-snooping routing-table vlan 100
Total 2 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, 225.1.1.1)
    Upstream neighbor: 10.1.1.2
      Upstream Ports (1 in total):
        GE1/0/2
      Downstream Ports (1 in total):
        GE1/0/4
          Expires: 00:03:11, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for multicast group 224.1.1.1 only to Router C.
- Switch A will forward the multicast data intended for multicast group 225.1.1.1 only to Router D.

Troubleshooting PIM snooping

PIM snooping does not work on a Layer 2 device

Symptom

PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about IGMP snooping and PIM snooping.
2. If IGMP snooping is not enabled, enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for the VLAN.
3. If PIM snooping is not enabled, enable PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Configuring multicast VLANs

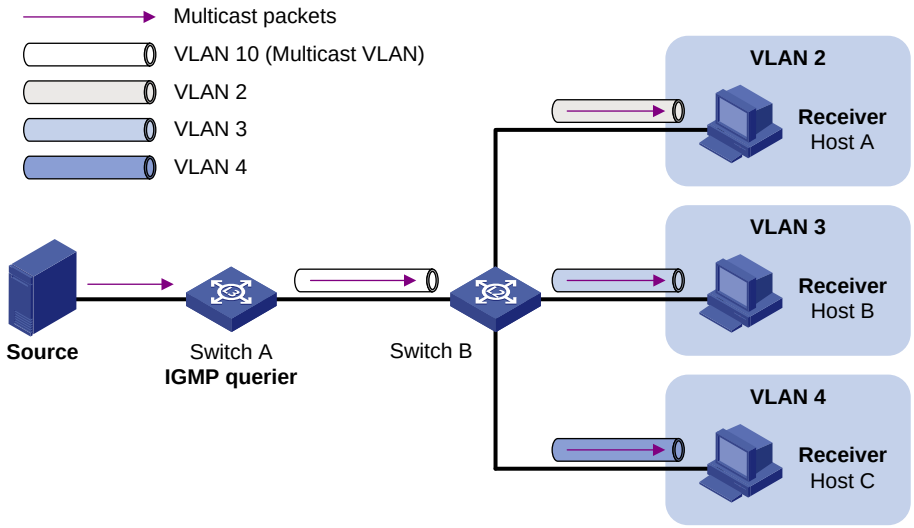
Multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in three different VLANs and the same multicast group. When Switch A (Layer 3 device) receives multicast data for that group, it sends three copies of the multicast data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the multicast VLAN feature

After a multicast VLAN is configured on Switch B, Switch A sends only one copy of the multicast data to the multicast VLAN on Switch B. This method saves network bandwidth and lessens the burden on the Layer 3 device.

Multicast VLAN implementations



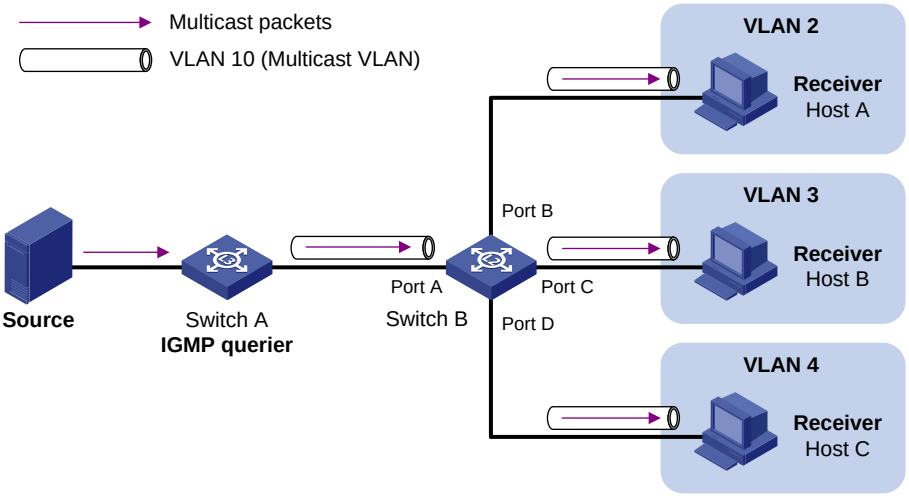
Multicast VLANs include sub-VLAN-based multicast VLANs and port-based multicast VLANs.

Sub-VLAN-based multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



IGMP snooping manages router ports in the multicast VLAN and member ports in each sub-VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN in the multicast VLAN.

Port-based multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. All the user ports are hybrid ports and are assigned to VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and VLAN 2 through VLAN 4.

Figure 3 Port-based multicast VLAN

IGMP snooping manages the router ports and member ports in the multicast VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Switch B sends a separate copy to each user port in the multicast VLAN.

Restrictions and guidelines: Multicast VLAN configuration

The VLAN to be configured as a multicast VLAN must exist.

If you have configured both a sub-VLAN-based multicast VLAN and a port-based multicast VLAN on a device, the port-based multicast VLAN configuration takes effect.

Do not configure a VLAN as a multicast VLAN or a multicast sub-VLAN if the VLAN interface is enabled with PIM or IGMP. Otherwise, the system displays errors. Do not enable PIM or IGMP on a VLAN interface if the VLAN interface belongs to a multicast VLAN or a multicast sub-VLAN. Otherwise, multicast forwarding exceptions occur.

The multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the multicast VLAN feature for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of a multicast VLAN must exist and cannot be multicast VLANs or sub-VLANs of any other multicast VLAN.

Prerequisites

Before you configure a sub-VLAN-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign VLANs to the multicast VLAN as sub-VLANs.
   subvlan *vlan-list*

Configuring a port-based multicast VLAN

Restrictions and guidelines

You can assign user ports to a multicast VLAN in multicast VLAN view or assign a user port to a multicast VLAN in interface view. These configurations have the same priority.

A user port can belong to only one multicast VLAN.

Prerequisites

Before you configure a port-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN.

- Enable IGMP snooping for all the VLANs that contain multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to a multicast VLAN in multicast VLAN view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign ports to the multicast VLAN.
   port *interface-list*

Assigning user ports to a multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the multicast VLAN.
   port multicast-vlan *vlan-id*
   By default, a port does not belong to any multicast VLAN.

Setting the maximum number of multicast VLAN forwarding entries

About this task

You can set the maximum number of multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of multicast VLAN forwarding entries.
   multicast-vlan entry-limit *limit*
   By default, the maximum number of multicast VLAN forwarding entries is 512.

Display and maintenance commands for multicast VLAN

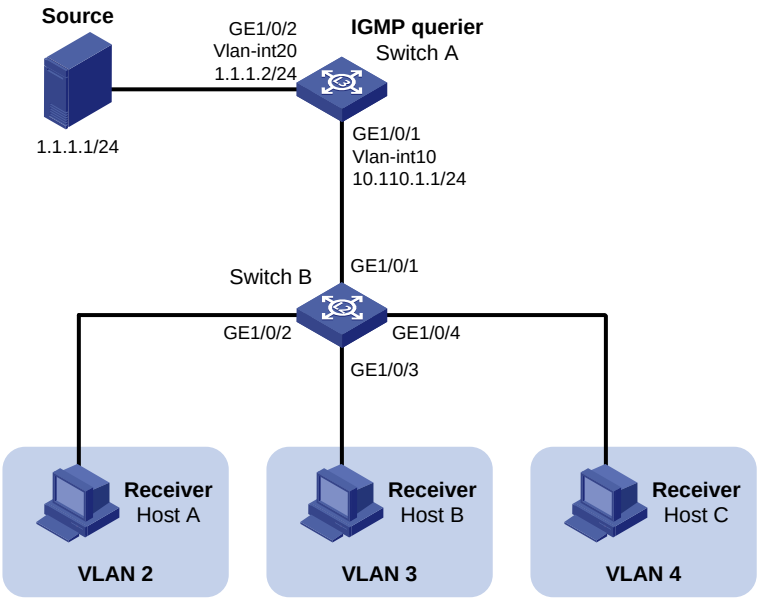
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about multicast VLANs.	**display multicast-vlan** [*vlan-id*]
Display information about multicast VLAN forwarding entries.	**display multicast-vlan forwarding-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about multicast groups in multicast VLANs.	**display multicast-vlan group** [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear multicast groups in multicast VLANs.	**reset multicast-vlan group** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Multicast VLAN configuration examples

Example: Configuring sub-VLAN-based multicast VLAN

Network configuration



As shown in Figure 4:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface20] pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] port link-type hybrid
   [SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
   [SwitchA-GigabitEthernet1/0/1] quit
   ```

   # Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ip address 10.110.1.1 24
   [SwitchA-Vlan-interface10] igmp enable
   [SwitchA-Vlan-interface10] quit
   ```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as a multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] multicast-vlan 10
[SwitchB-mvlan-10] subvlan 2 to 4
[SwitchB-mvlan-10] quit
```

Verifying the configuration

Display information about all multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about multicast groups in multicast VLANs on Switch B.

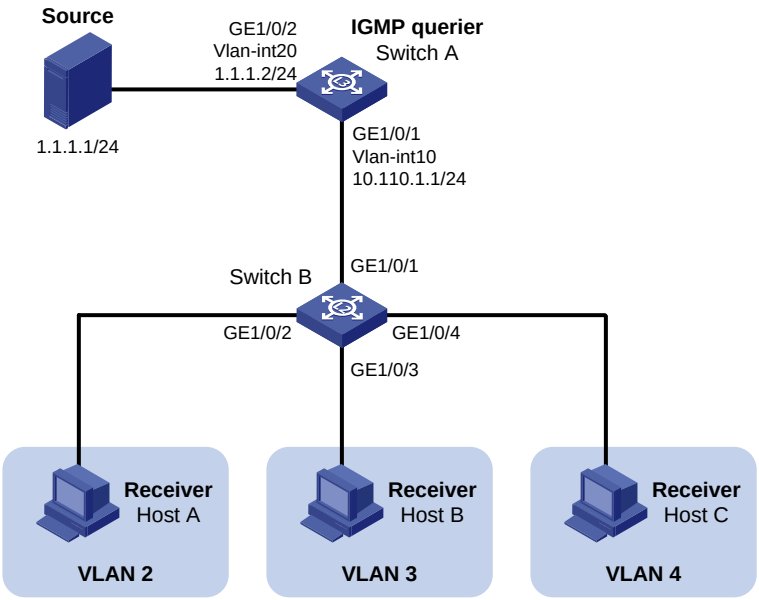
```
[SwitchB] display multicast-vlan group
Total 1 entries.

Multicast VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that multicast group 224.1.1.1 belongs to multicast VLAN 10. Multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based multicast VLAN

Network configuration



As shown in Figure 5:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.1.2 24
[SwitchA-Vlan-interface20] pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as a multicast VLAN.

```
[SwitchB] multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic IGMP snooping forwarding entries on Switch B.

```
[SwitchB] display igmp-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(0.0.0.0, 224.1.1.1)
  Host ports (3 in total):
    GE1/0/2        (00:03:23)
    GE1/0/3        (00:04:07)
    GE1/0/4        (00:04:16)
```

The output shows that IGMP snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the multicast data of VLAN 10 through these user ports.

Configuring multicast routing and forwarding

About multicast routing and forwarding

Each multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the multicast routing protocols and statically configured multicast routing entries are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general multicast routing table. The optimal multicast routing entries in the general multicast routing table are added to the multicast forwarding table to guide multicast data forwarding.

RPF check mechanism

A multicast routing protocol uses reverse path forwarding (RPF) check to ensure the multicast data delivery along the correct path and to avoid data loops.

RPF check process

A multicast device performs the RPF check on a multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the unicast and static multicast routing tables.

   The term "packet source" means different things in different situations:

   - For a packet that travels along the SPT, the packet source is the multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "PIM overview."
2. Selects one of the three optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with the highest subnet mask becomes the RPF route. If the routes have the same mask, the route with the highest route preference becomes the RPF route. If the routes have the same route preference, the unicast route becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with the highest route preference becomes the RPF route. If the routes have the same preference, the unicast route becomes the RPF route.

   The RPF route contains the RPF interface and RPF neighbor information.
   - If the RPF route is a unicast route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
   - If the RPF route is a static multicast route, the RPF interface and RPF neighbor are specified in the route.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.
   - If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in multicast

Implementing an RPF check on each received multicast packet brings a big burden to the device. The use of a multicast forwarding table is the solution to this issue. When the device creates a multicast forwarding entry for an (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up the multicast forwarding table for a matching (S, G) entry.

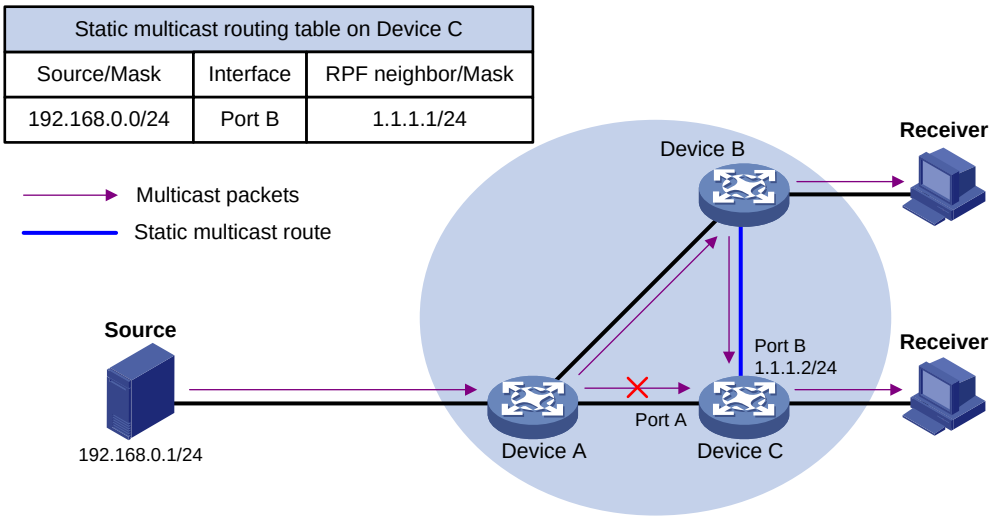
- If no match is found, the device first determines the RPF route back to the packet source and the RPF interface. Then, it creates a forwarding entry with the RPF interface as the incoming interface and makes the following judgments:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all the outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all the outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following actions:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

Figure 1 RPF check process

As shown in Figure 1, assume that unicast routes are available on the network, and no static multicast routes have been configured on Device C. Multicast packets travel along the SPT from the multicast source to the receivers. The multicast forwarding table on Device C contains the (S, G) entry, with Port A as the incoming interface.

- If a multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.
- If a multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its unicast routing table and finds that the

outgoing interface to the source (the RPF interface) is Port A. In this case, the (S, G) entry is correct, but the packet traveled along a wrong path. The packet fails the RPF check and Device C discards the packet.



Usages of static multicast routes

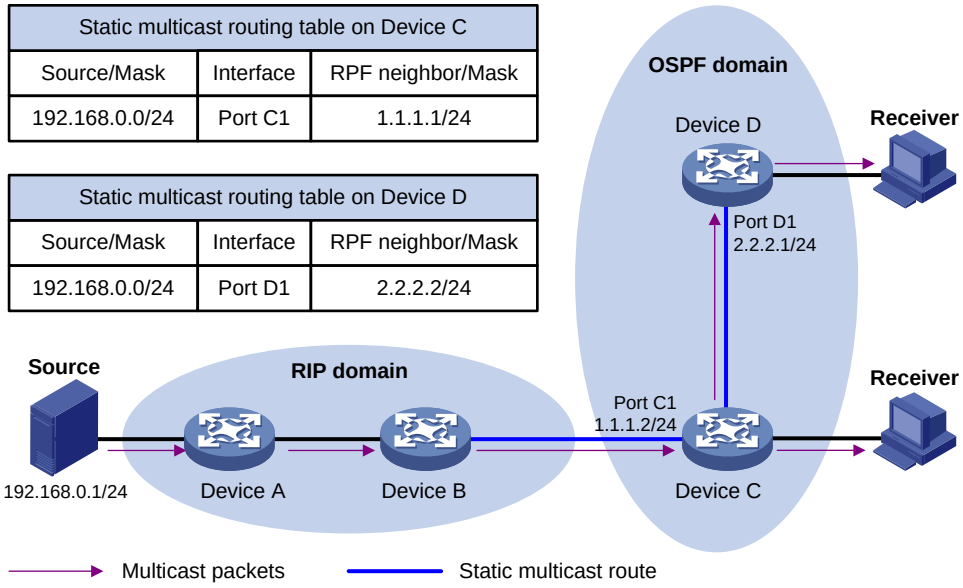
A static multicast route can change an RPF route or create an RPF route.

Changing an RPF route

Typically, the topology structure of a multicast network is the same as that of a unicast network, and multicast traffic follows the same transmission path as unicast traffic does. You can configure a static multicast route for a multicast source to change the RPF route. As a result, the device creates a transmission path for multicast traffic that is different from the transmission path for unicast traffic.

Figure 2 Changing an RPF route

As shown in Figure 2, when no static multicast route is configured, Device C's RPF neighbor on the path back to the source is Device A. The multicast data from the source travels through Device A to Device C. You can configure a static multicast route on Device C and specify Device B as Device C's RPF neighbor on the path back to the source. The multicast data from the source travels along the path: Device A to Device B and then to Device C.



Creating an RPF route

When a unicast route is blocked, multicast forwarding might be stopped due to lack of an RPF route. You can configure a static multicast route to create an RPF route. In this way, a multicast routing entry is created to guide multicast forwarding.

Figure 3 Creating an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port C1	1.1.1.1/24

Static multicast routing table on Device D		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port D1	2.2.2.2/24

As shown in Figure 3, the RIP domain and the OSPF domain are unicast isolated from each other. For the receiver hosts in the OSPF domain to receive multicast packets from the multicast source in the RIP domain, you must configure Device C and Device D as follows:

- On Device C, configure a static multicast route for the multicast source and specify Device B as the RPF neighbor.
- On Device D, configure a static multicast route for the multicast source and specify Device C as the RPF neighbor.

Mtrace

Mtrace is a traceroute facility used to trace the path along which multicast group data travels from a source to a destination.

Device roles

Mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has a multicast-enabled interface on the same subnet as the destination and can forward specific multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the multicast source.
- **Client**—A client is a router that initiates an mtrace.

Process

The mtrace process is as follows:

1. The client sends an mtrace Query message (with a **hops** field indicating the maximum number of hops to trace) to the destination.
2. The LHR turns the received Query message to an mtrace Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

If the client does not receive a Reply message within the waiting time, the client initiates a hop-by-hop trace to determine which device on the path encountered an error. It sends a Query message with the **hops** field set to 1 and waits for a Reply message. If it does not receive a Reply message within the waiting time, the client determines that this hop encountered an error. If the client receives a Reply message within the waiting time, it sends a Query message with the **hops** field value increased by 1 and waits for a Reply message. This process continues until the client does not receive a Reply message within the waiting time any more.

Restrictions: Hardware compatibility with multicast routing and forwarding

Only the S5136S-EI switch series supports multicast routing and forwarding.

Multicast routing and forwarding tasks at a glance

To configure multicast routing and forwarding, perform the following tasks:

1. Enabling IP multicast routing
2. (Optional.) Configuring static multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring a multicast forwarding boundary
5. (Optional.) Using mtrace to trace a multicast path
6. (Optional.) Setting the maximum number of cached unknown multicast packets
7. (Optional.) Setting the maximum number of copied multicast packets during software forwarding

Prerequisites for multicast routing and forwarding

Before you configure multicast routing and forwarding, configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IP multicast routing

About this task

Enable IP multicast routing before you configure any Layer 3 multicast functionality on the public network or VPN instance.

Procedure

1. Enter system view.

   system-view
2. Enable IP multicast routing and enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

   By default, IP multicast routing is disabled.

Configuring static multicast routes

About this task

To configure a static multicast route for a multicast source, you can specify an RPF interface or an RPF neighbor for the multicast traffic from that source.

Restrictions and guidelines

Static multicast routes take effect only on the multicast devices on which they are configured, and will not be advertised throughout the network or redistributed to other devices.

Procedure

1. Enter system view.

   system-view

2. Configure a static multicast route.

   ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]

3. (Optional.) Delete all static multicast routes.

   delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

   You can use the **undo ip rpf-route-static** command to delete a specific static multicast route or use the **delete ip rpf-route-static** command to delete all static multicast routes.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Specify the longest prefix match principle.

   longest-match

   By default, the route preference principle is used.

Configuring a multicast forwarding boundary

About this task

You can configure an interface as a multicast forwarding boundary for a multicast group range. The interface cannot receive or forward multicast packets for the group range.

Restrictions and guidelines

You do not need to enable IP multicast before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a multicast forwarding boundary for a multicast group range.
   multicast boundary *group-address* { *mask-length* | *mask* }
   By default, an interface is not a multicast forwarding boundary.

Using mtrace to trace a multicast path

Using mtrace1 to trace a multicast path

To use mtrace version 1 (mtrace1) to trace a multicast path, execute the following command in any view:

mtrace [**v1**] [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address*] [**verbose**]

Using mtrace2 to trace a multicast path

Restrictions and guidelines

For successful mtrace, do not specify a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Specify the UDP port number used by mtrace.
   mtrace-service port *number*
   By default, mtrace uses UDP port number 10240.
3. Use mtrace version 2 (mtrace2) to trace a multicast path.
   mtrace v2 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]
   Execute this command in any view.
   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown multicast packets

About this task

The device caches a multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly

dropping multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **multicast forwarding-table cache-unknown total** command to be far greater than the value in the **multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of unknown multicast packets that can be cached for an (S, G) entry.
   multicast forwarding-table cache-unknown per-entry *per-entry-limit*
   By default, the device can cache only one unknown multicast packet for an (S, G) entry.
3. Set the maximum number of unknown multicast packets that can be cached in total.
   multicast forwarding-table cache-unknown total *total-limit*
   By default, the device can cache 1024 unknown multicast packets in total.

Setting the maximum number of copied multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause multicast packets to be dropped.

CAUTION:
Perform this task under the guidance of H3C Support.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of copied multicast packets during software forwarding.
   multicast cpu-forwarding max-copy-count *count*
   The default setting is 5.

Display and maintenance commands for multicast routing and forwarding

CAUTION:
The **reset** commands might cause multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the MRIB.	**display mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display multicast boundary information.	**display multicast** [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]
Display multicast fast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*source-address* | *group-address*] * [**slot** *slot-number*]
Display statistics for multicast forwarding events.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display multicast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *
Display multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]
Display RPF information for a multicast source.	**display multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]
Clear multicast fast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for multicast forwarding events.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear multicast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length*

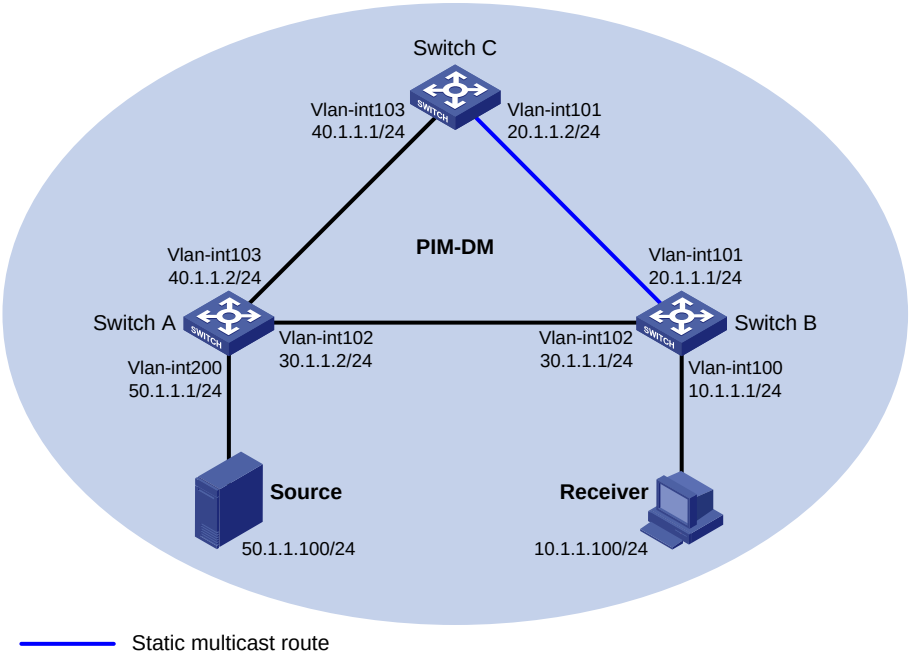
Task	Command
	| *mask* }] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear multicast routing entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear a multicast routing entry, the associated multicast forwarding entry is also cleared.
- When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 4:

- PIM-DM runs on the network.
- All switches on the network support multicast.
- Switch A, Switch B and Switch C run OSPF.
- Typically, the receiver host can receive the multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the multicast data from the source travels to the receiver through the path: Switch A to Switch C to Switch B. This is different from the unicast route.

Figure 4 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 4, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable PIM-DM on other interfaces.

   ```
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] pim dm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] pim dm
   [SwitchB-Vlan-interface102] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 200
   [SwitchA-Vlan-interface200] pim dm
   ```

```
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing and PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. Configure a static multicast route on Switch B and specify Switch C as its RPF neighbor on the route to the source.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 20.1.1.2
```

Verifying the configuration

Display RPF information for the source on Switch B.

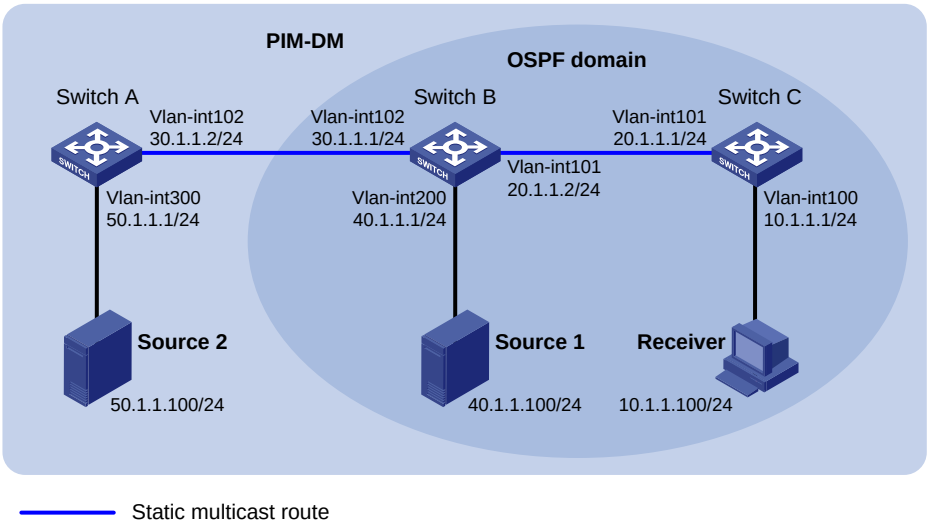
```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route

Network configuration



As shown in Figure 5:

- PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPF, and have no unicast routes to Switch A.

- Typically, the receiver host receives the multicast data from Source 1 in the OSPF domain.

Configure the switches so that the receiver host receives multicast data from Source 2, which is outside the OSPF domain.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 5, and configure OSPF on Switch B and Switch C.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch C, enable IP multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] multicast routing
   [SwitchC-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] igmp enable
   [SwitchC-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] pim dm
   [SwitchC-Vlan-interface101] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 300
   [SwitchA-Vlan-interface300] pim dm
   [SwitchA-Vlan-interface300] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim dm
   ```

```
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing and PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display multicast rpf-info 50.1.1.100
[SwitchC] display multicast rpf-info 50.1.1.100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B or Switch C.

3. Configure a static multicast route:

Configure a static multicast route on Switch B and specify Switch A as its RPF neighbor on the route to Source 2.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 30.1.1.2
```

Configure a static multicast route on Switch C and specify Switch B as its RPF neighbor on the route to Source 2.

```
[SwitchC] ip rpf-route-static 10.1.1.0 24 20.1.1.2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. The routes are the configured static routes.

Troubleshooting multicast routing and forwarding

Static multicast route failure

Symptom

No dynamic routing protocol is enabled on the device, and the physical status and link layer status of interfaces are both up, but the static multicast route fails.

Solution

To resolve the problem:

1. Use the **`display multicast routing-table static`** command to display information about static multicast routes. Verify that the static multicast route has been correctly configured and that the route entry exists in the static multicast routing table.
2. Check the type of interface that connects the static multicast route to the RPF neighbor. If the interface is not a point-to-point interface, be sure to specify the address for the RPF neighbor.
3. If the problem persists, contact H3C Support.

Configuring IGMP

About IGMP

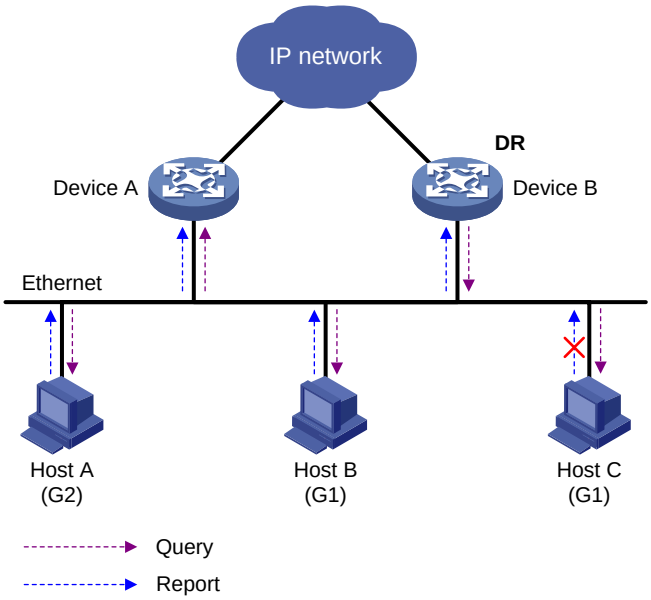
Internet Group Management Protocol (IGMP) establishes and maintains the multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

IGMP versions

IGMP has the following versions:

- IGMPv1 (defined by RFC 1112).
- IGMPv2 (defined by RFC 2236).
- IGMPv3 (defined by RFC 3376).

All IGMP versions support the ASM model. IGMPv3 can directly implement the SSM model. IGMPv1 and IGMPv2 must work with the IGMP SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."



IGMPv1 overview

IGMPv1 manages multicast group memberships based on the query and response mechanism.

All devices that run IGMP on the same subnet can get IGMP membership report messages (called reports) from hosts. However, only one device can act as the IGMP querier to send IGMP query messages (called queries). The querier election mechanism determines which device acts as the IGMP querier on the subnet.

In IGMPv1, the DR elected by the multicast routing protocol (such as PIM) acts as the IGMP querier. For more information about DR, see "PIM overview."

Figure 1 IGMP queries and reports

As shown in Figure 1, Host B and Host C are interested in the multicast data addressed to the multicast group G1. Host A is interested in the multicast data addressed to G2. The following process

describes how the hosts join the multicast groups and how the IGMP querier (Device B in Figure 1) maintains the multicast group memberships:

1. The hosts send unsolicited IGMP reports to the multicast groups they want to join without having to wait for the IGMP queries.
2. The IGMP querier periodically multicasts IGMP queries (with the destination address of 224.0.0.1) to all hosts and devices on the local subnet.
3. After receiving a query message, the host whose report delay timer expires first sends an IGMP report to multicast group G1 to announce its membership for G1. In this example, Host B sends the report message. After receiving the report from Host B, Host C suppresses its own report for G1.

   Because IGMP devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host IGMP report suppression, helps reduce traffic on the local subnet.
4. At the same time, Host A sends a report to the multicast group G2 after receiving a query.
5. Through the query and response process, the IGMP devices (Device A and Device B) determine that the local subnet has members of G1 and G2. The multicast routing protocol (PIM, for example) on the devices generates (*, G1) and (*, G2) multicast forwarding entries, where asterisk (*) represents any multicast source. These entries are the basis for subsequent multicast forwarding.
6. When the multicast data addressed to G1 or G2 reaches an IGMP device, the device looks up the multicast forwarding table. Based on the (*, G1) or (*, G2) entries, the device forwards the multicast data to the local subnet. Then, the receivers on the subnet can receive the data.

IGMPv1 does not define a leave group message (often called a leave message). When an IGMPv1 host is leaving a multicast group, it stops sending reports to that multicast group. If the subnet has no members for a multicast group, the IGMP devices will not receive any report addressed to that multicast group. In this case, the devices clear the information for that multicast group after a period of time.

IGMPv2 enhancements

Backwards-compatible with IGMPv1, IGMPv2 has introduced a querier election mechanism and a leave-group mechanism.

Querier election mechanism

In IGMPv1, the DR elected by the Layer 3 multicast routing protocol (such as PIM) acts as the querier.

IGMPv2 introduced an independent querier election mechanism. The querier election process is as follows:

1. Initially, every IGMPv2 device assumes itself to be the querier. Each device sends IGMP general query messages (called general queries) to all hosts and devices on the local subnet. The destination address is 224.0.0.1.
2. After receiving a general query, every IGMPv2 device compares the source IP address of the query with its own interface address. The device with the lowest IP address becomes the querier. All the other IGMPv2 devices become non-queriers.
3. All the non-queriers start the other querier present timer. If a device receives an IGMP query from the querier before the timer expires, it resets this timer. Otherwise, the device considers that the querier has timed out. In this case, the device initiates a new querier election process.

"Leave group" mechanism

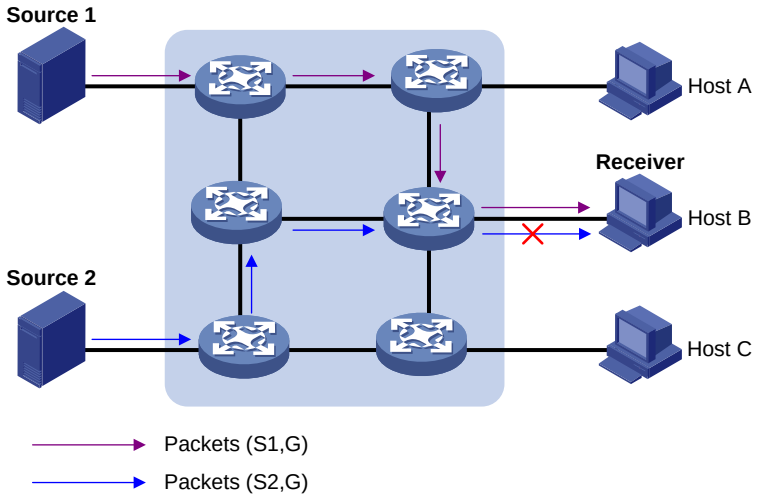
In IGMPv1, when a host leaves a multicast group, it does not send any notification to the multicast devices. The multicast devices determine whether a group has members by using the maximum response time. This adds to the leave latency.

In IGMPv2, when a host is leaving a multicast group, the following process occurs:

1. The host sends a leave message to all devices on the local subnet. The destination address of leave messages is 224.0.0.2.
2. After receiving the leave message, the querier sends a configurable number of IGMP group-specific queries to the group that the host is leaving. Both the destination address field and the group address field of the message are the address of the multicast group that is being queried.
3. One of the remaining members (if any on the subnet) in the group should send a report within the maximum response time advertised in the group-specific queries.
4. If the querier receives a report for the group before the maximum response timer expires, it maintains the memberships for the group. Otherwise, the querier assumes that the local subnet has no member hosts for the group and stops maintaining the memberships for the group.

IGMPv3 enhancements

IGMPv3 is based on and is compatible with IGMPv1 and IGMPv2. It enhances the control capabilities of hosts and the query and report capabilities of IGMP devices.



Enhancements in control capability of hosts

IGMPv3 introduced two source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified multicast sources. When a host joins a multicast group, one of the following occurs:

- If the host expects to receive multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host expects to reject multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two multicast sources: Source 1 (S1) and Source 2 (S2). Both of these sources can send multicast data to the multicast group G. Host B wants to receive the multicast data addressed to G from Source 1 but not from Source 2.

Figure 2 Flow paths of source-and-group-specific multicast traffic

In IGMPv1 or IGMPv2, Host B cannot select multicast sources when it joins the multicast group G. The multicast streams from both Source 1 and Source 2 flow to Host B whether or not it needs them.

In IGMPv3, Host B can explicitly express that it needs to receive multicast data destined to the multicast group G from Source 1 but not from Source 2.

Enhancements in query and report capabilities

IGMPv3 introduces IGMP group-and-source queries and IGMP reports carrying group records.

- Query message carrying the source addresses

  IGMPv3 is compatible with IGMPv1 and IGMPv2 and supports IGMP general queries and IGMP group-specific queries. It also introduces IGMP group-and-source-specific queries.

  - A general query does not carry a group address or a source address.
  - A group-specific query carries a group address, but no source address.
  - A group-and-source-specific query carries a group address and one or more source addresses.

- Reports containing multiple group records

  Unlike an IGMPv1 or IGMPv2 report, an IGMPv3 report is destined to 224.0.0.22 and contains one or more group records. Each group record contains a multicast group address and a multicast source address list.

  Group records include the following categories:

  - **IS_IN**—The current filtering mode is Include. The report sender requests the multicast data only from the sources specified in the Source Address field.
  - **IS_EX**—The current filtering mode is Exclude. The report sender requests the multicast data from any sources except those specified in the Source Address field.
  - **TO_IN**—The filtering mode has changed from Exclude to Include.
  - **TO_EX**—The filtering mode has changed from Include to Exclude.
  - **ALLOW**—The Source Address field contains a list of additional sources from which the receiver wants to obtain data. If the current filtering mode is Include, these sources are added to the multicast source list. If the current filtering mode is Exclude, these sources are deleted from the multicast source list.
  - **BLOCK**—The Source Address field contains a list of the sources from which the receiver no longer wants to obtain data. If the current filtering mode is Include, these sources are deleted from the multicast source list. If the current filtering mode is Exclude, these sources are added to the multicast source list.

IGMP SSM mapping

An IGMPv3 host can explicitly specify multicast sources in its IGMPv3 reports. From the reports, the IGMP device can obtain the multicast source addresses and directly provide the SSM service. However, an IGMPv1 or IGMPv2 host cannot specify multicast sources in its IGMPv1 or IGMPv2 reports.

The IGMP SSM mapping feature enables the IGMP device to provide SSM support for IGMPv1 or IGMPv2 hosts. The device translates (*, G) in IGMPv1 or IGMPv2 reports into (G, INCLUDE, (S1, S2...)) based on the configured IGMP SSM mappings.

Figure 3 IGMP SSM mapping

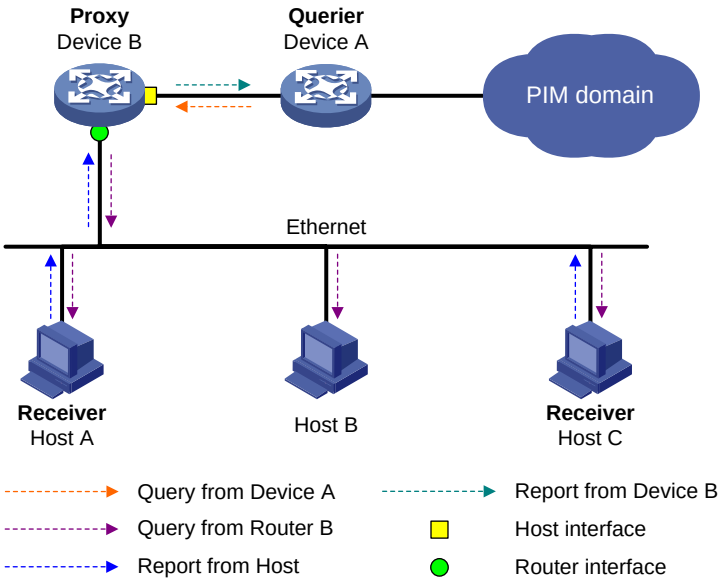
As shown in Figure 3, on an SSM network, Host A, Host B, and Host C run IGMPv1, IGMPv2, and IGMPv3, respectively. To provide the SSM service for Host A and Host B, you must configure the IGMP SSM mapping feature on Device A.

After IGMP SSM mappings are configured, Device A checks the multicast group address G in the received IGMPv1 or IGMPv2 report, and performs the following operations:

- If G is not in the SSM group range, Device A provides the ASM service.
- If G is in the SSM group range but does not match any IGMP SSM mapping, Device A drops the report.
- If G is in the SSM group range and matches IGMP SSM mappings, Device A translates (*, G) in the report into (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The IGMP SSM mapping feature does not process IGMPv3 reports.



For more information about SSM group ranges, see "PIM overview" and "Configuring PIM."

IGMP proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to run multicast routing protocols, such as PIM, on edge devices. Instead, you can configure IGMP proxying on these devices. With IGMP proxying configured, the edge device acts as an IGMP proxy:

- For the upstream IGMP querier, the IGMP proxy device acts as a host.
- For the downstream receiver hosts, the IGMP proxy device acts as an IGMP querier.

Figure 4 IGMP proxying

The following types of interfaces are defined in IGMP proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running IGMP. IGMP proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running IGMP. IGMP must be configured on this interface.

An IGMP proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or send join/leave messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received IGMP reports.

IGMP support for VPNs

IGMP maintains group memberships on a per-interface basis. After receiving an IGMP message on an interface, IGMP processes the packet within the VPN to which the interface belongs. IGMP only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 1112, *Host Extensions for IP Multicasting*
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 3376, *Internet Group Management Protocol, Version 3*

Restrictions: Hardware compatibility with IGMP

Only the S5136S-EI switch series supports IGMP.

IGMP tasks at a glance

To configure IGMP, perform the following tasks:

1. Enabling IGMP
2. (Optional.) Configuring basic IGMP features
   - Specifying an IGMP version
   - Configuring a static group member
   - Configuring a multicast group policy
3. (Optional.) Adjusting IGMP performance
   - Configuring IGMP query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring IGMP SSM mappings
5. (Optional.) Configuring IGMP proxying
   - Enabling IGMP proxying
   - Enabling multicast forwarding on a non-querier interface
   - Configuring multicast load splitting for IGMP proxy interfaces
6. (Optional.) Enabling IGMP NSR
7. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
8. (Optional.) Enabling SNMP notifications for IGMP
9. (Optional.) Configuring IGMP logging
   - Enabling IGMP logging
   - Enabling log message suppression for IGMP

Prerequisites for IGMP

Before you configure IGMP, you must configure any unicast routing protocol so that all devices can interoperate at the network layer.

Enabling IGMP

Restrictions and guidelines

Enable IGMP on interfaces where the multicast group memberships are established and maintained.

For IGMP to take effect on an interface, you must configure the primary IP address for the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.

interface *interface-type interface-number*

5. Enable IGMP.
   igmp enable
   By default, IGMP is disabled.

Configuring basic IGMP features

Specifying an IGMP version

Restrictions and guidelines

For IGMP to operate correctly, specify the same IGMP version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IGMP version on the interface.
   igmp version *version-number*
   By default, the IGMP version on an interface is IGMPv2.

Configuring a static group member

About this task

You can configure an interface as a static group member of a multicast group. Then, the interface can always receive multicast data addressed to the specified multicast group.

A static group member does not respond to IGMP queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited IGMP report or leave message.

Restrictions and guidelines

The interface to be configured as a static group member has the following restrictions:

- If the interface is IGMP and PIM-SM enabled, it must be a PIM-SM DR.
- If the interface is IGMP enabled but not PIM-SM enabled, it must be an IGMP querier.

For more information about PIM-SM and DR, see "PIM overview."

When you configure an interface as a static group member for multiple multicast groups or multicast sources and groups in batch, follow these restrictions and guidelines:

- Multicast group addresses in different batch configurations can overlap.
- The **undo igmp static-group** command does not support deleting one multicast group from batch configuration. When you delete a batch configuration, make sure the setting in the **undo** command match the batch configuration.
- If two batch configurations have the same parameter settings except the setting of the **number** *group-number* option, the new configuration takes effect.

Procedure

1. Enter system view.
   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the interface as a static group member.

   igmp static-group *group-address* [**inc-step-mask** { *group-mask* | *group-mask-length* } **number** *group-number*] [**source** *source-address*]

Configuring a multicast group policy

About this task

This feature enables an interface to filter IGMP reports by using an ACL that specifies multicast groups and the optional sources. It is used to control the multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send IGMP reports.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure a multicast group policy.

   igmp group-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* } [*version-number*]

Adjusting IGMP performance

Configuring IGMP query and response parameters

About this task

The following are IGMP query and response parameters:

- **IGMP querier's robustness variable**—Number of times for retransmitting IGMP queries in case of packet loss. A higher robustness variable makes the IGMP querier more robust, but increases the timeout time for multicast groups.
- **IGMP startup query interval**—Interval at which an IGMP querier sends IGMP general queries at startup.
- **IGMP startup query count**—Number of IGMP general queries that an IGMP querier sends at startup.
- **IGMP general query interval**—Interval at which an IGMP querier sends IGMP general queries to check for multicast group members on the network.
- **IGMP last member query interval**—In IGMPv2, it sets the interval at which a querier sends group-specific queries after receiving a leave message. In IGMPv3, it sets the interval at which a querier sends group-and-source-specific queries after receiving a report that changes multicast source and group mappings.
- **IGMP last member query count**—In IGMPv2, it sets the number of group-specific queries that a querier sends after receiving a leave message. In IGMPv3, it sets the number of group-and-source-specific queries that a querier sends after receiving a report that changes multicast source and group mappings.

- **IGMP maximum response time**—Maximum time before a receiver responds with a report to an IGMP general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the IGMP query. When the timer value for a group decreases to 0, the receiver sends an IGMP report to the group.
- **IGMP other querier present timer**—Lifetime for an IGMP querier after a non-querier receives an IGMP general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

To avoid frequent IGMP querier changes, set the IGMP other querier present timer greater than the IGMP general query interval. In addition, configure the same IGMP other querier present timer for all IGMP devices on the same subnet.

To avoid mistakenly deleting multicast receivers, set the IGMP general query interval greater than the maximum response time for IGMP general queries.

To speed up the response to IGMP queries and avoid simultaneous timer expirations that cause IGMP report traffic bursts, set an appropriate maximum response time.

- For IGMP general queries, the maximum response time is set by the **max-response-time** command.
- For IGMP group-specific queries and IGMP group-and-source-specific queries, the maximum response time equals the IGMP last member query interval.

The following configurations take effect only on the devices that run IGMPv2 and IGMPv3:

- Maximum response time for IGMP general queries.
- IGMP last member query interval.
- IGMP last member query count.
- IGMP other querier present interval.

You can configure the IGMP query and response parameters globally for all interfaces in IGMP view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the IGMP query and response parameters globally

1. Enter system view.

   system-view
2. Enter IGMP view.

   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the IGMP querier's robustness variable.

   robust-count *count*

   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.

   startup-query-interval *interval*

   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.

   startup-query-count *count*

   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.

   query-interval *interval*

   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.

last-member-query-interval *interval*

By default, the IGMP last member query interval is 1 second.

8. Set the IGMP last member query count.

   last-member-query-count *count*

   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.

9. Set the maximum response time for IGMP general queries.

   max-response-time *time*

   By default, the maximum response time for IGMP general queries is 10 seconds.

10. Set the IGMP other querier present timer.

    other-querier-present-interval *interval*

    By default, the IGMP other querier present timer is calculated by using the following formula: [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Configuring the IGMP query and response parameters on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the IGMP querier's robustness variable.

   igmp robust-count *count*

   By default, the IGMP querier's robustness variable is 2.

4. Set the IGMP startup query interval.

   igmp startup-query-interval *interval*

   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.

5. Set the IGMP startup query count.

   igmp startup-query-count *count*

   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.

6. Set the IGMP general query interval.

   igmp query-interval *interval*

   By default, the IGMP general query interval is 125 seconds.

7. Set the IGMP last member query interval.

   igmp last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second.

8. Set the IGMP last member query count.

   igmp last-member-query-count *count*

   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.

9. Set the maximum response time for IGMP general queries.

   igmp max-response-time *time*

   By default, the maximum response time for IGMP general queries is 10 seconds.

10. Set the IGMP other querier present timer.

    igmp other-querier-present-interval *interval*

By default, the IGMP other querier present timer is calculated by using the following formula:

[IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an IGMP querier to send leave notifications to the upstream without sending group-specific or group-and-source-specific queries after receiving a leave message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Restrictions and guidelines

The fast-leave processing configuration takes effect only when the device runs IGMPv2 or IGMPv3.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   igmp fast-leave [**group-policy** *ipv4-acl-number*]
   By default, fast-leave processing is disabled.

Configuring IGMP SSM mappings

About this task

This feature enables the device to provide SSM services for IGMPv1 or IGMPv2 hosts.

Restrictions and guidelines

This feature does not process IGMPv3 messages. Enable IGMPv3 on the receiver-side interface to ensure that IGMPv3 reports can be processed..

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Configure an IGMP SSM mapping.
   ssm-mapping *source-address* { *ipv4-acl-number* | **name** *ipv4-acl-name* }

Configuring IGMP proxying

Prerequisites for configuring IGMP proxying

Before you configure IGMP proxying, determine the router interfaces and host interfaces based on the network topology, and enable IGMP on the router interfaces.

Enabling IGMP proxying

Restrictions and guidelines

Enable IGMP proxying on the receiver-side interfaces.

If IGMP proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward multicast traffic.

On an interface enabled with IGMP proxying, only the **igmp version** command takes effect and other IGMP commands do not take effect.

If you enable both IGMP proxying and a multicast routing protocol (such as PIM or MSDP) on the same device, the multicast routing protocol does not take effect.

In IGMPv1, the DR is elected by PIM and acts as the IGMP querier. Because PIM does not take effect on a proxy device, a router interface running IGMPv1 cannot be elected as the DR. To ensure that the downstream receiver hosts on the router interface can receive multicast data, you must enable multicast forwarding on the interface. For more information, see "Enabling multicast forwarding on a non-querier interface."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IGMP proxying.
   igmp proxy enable
   By default, IGMP proxying is disabled.

Enabling multicast forwarding on a non-querier interface

About this task

Typically, only IGMP queriers can forward multicast traffic and non-queriers cannot. This prevents multicast data from being repeatedly forwarded. If a router interface on an IGMP proxy device failed in the querier election, enable multicast forwarding on the interface to forward multicast data to attached receiver hosts.

Restrictions and guidelines

A shared-media network might have multiple IGMP proxies, including one proxy acting as a querier. To avoid duplicate multicast traffic, do not enable multicast forwarding on any of the non-querier IGMP proxies for the network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable multicast forwarding on the interface.
   igmp proxy forwarding
   By default, multicast forwarding is disabled on a non-querier interface.

Configuring multicast load splitting for IGMP proxy interfaces

About this task

If multiple IGMP proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards multicast traffic. You can enable multicast load splitting for IGMP proxy interfaces so that all the proxy interfaces can share multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Enable multicast load splitting for IGMP proxy interfaces.
   proxy multipath
   By default, multicast load splitting is disabled for IGMP proxy interfaces.

Enabling IGMP NSR

About this task

This feature backs up information about IGMP interfaces and IGMP multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP NSR.
   igmp non-stop-routing
   By default, IGMP NSR is disabled.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP

About this task

To report critical IGMP events to an SNMP NMS, enable SNMP notifications for IGMP.

For IGMP SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IGMP.
   snmp-agent trap enable igmp [**join** | **leave**] *
   By default, SNMP notifications are enabled for IGMP.

Configuring IGMP logging

Enabling IGMP logging

About this task

To report critical IGMP events to the information center, enable IGMP logging. For IGMP log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IGMP logging or use the **igmp log suppress** command to enable IGMP log message suppression.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP logging.
   igmp log enable [**group**]
   IGMP logging is enabled by default.

Enabling log message suppression for IGMP

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IGMP. With this feature configured, the speed of sending IGMP log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IGMP logging has been enabled using the **igmp log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for IGMP.
   igmp log suppress [**group**]
   By default, log message suppression is enabled for IGMP.

Display and maintenance commands for IGMP

CAUTION:
The **reset igmp group** command might cause multicast data transmission failures.

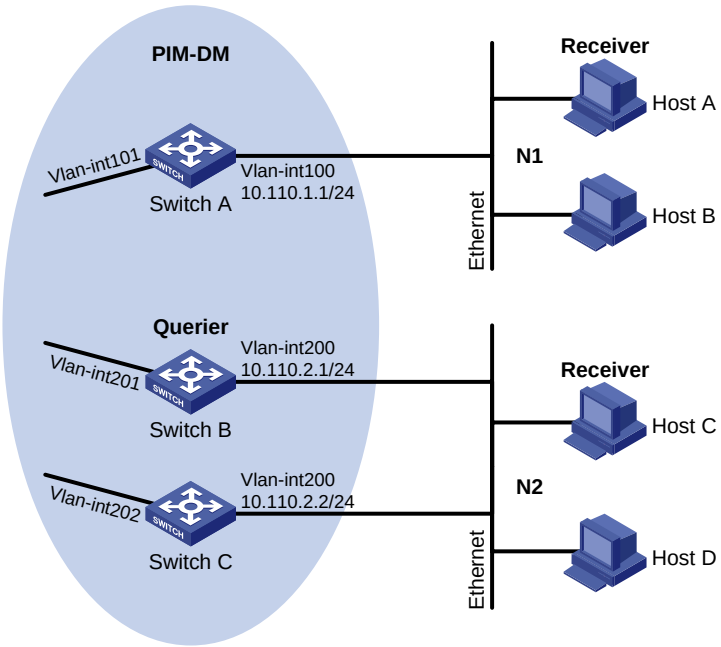
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IGMP multicast groups.	**display igmp** [**vpn-instance** *vpn-instance-name*] **group** [*group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display IGMP information for interfaces.	**display igmp** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**host** | **proxy**] [**verbose**]
Display multicast group membership information maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display multicast routing entries maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]
Display IGMP SSM mappings.	**display igmp** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*
Clear dynamic IGMP multicast group entries.	**reset igmp** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

IGMP configuration examples

Example: Configuring basic IGMP features

Network configuration



As shown in Figure 5:

- OSPF and PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are receiver hosts in N1 and N2, respectively.
- IGMPv2 runs between Switch A and N1, and between the other two switches and N2. Switch A acts as the IGMP querier in N1. Switch B acts as the IGMP querier in N2 because it has a lower IP address.

Configure the routers to meet the following requirements:

- The hosts in N1 can join only multicast group 224.1.1.1.
- The hosts in N2 can join any multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches in the PIM-DM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 101.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim dm
[SwitchA-Vlan-interface101] quit
```

On Switch B, enable IP multicast routing.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] igmp enable
[SwitchB-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IP multicast routing.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure a multicast group policy on Switch A so that hosts connected to VLAN-interface 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display IGMP information for VLAN-interface 200 on Switch B.

```
[SwitchB] display igmp interface vlan-interface 200
 Vlan-interface200(10.110.2.1):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
```

```
  Maximum query response time for IGMP: 10s
  Querier for IGMP: 10.110.2.1 (This router)
IGMP groups reported in total: 1
```

Example: Configuring IGMP SSM mapping

Network configuration

As shown in Figure 6:

- OSPF runs on the network.
- The PIM-SM domain uses the SSM model for multicast delivery. The SSM group range is 232.1.1.0/24.
- IGMPv3 runs on VLAN-interface 400 of Switch D. The receiver host runs IGMPv2, and does not support IGMPv3. The receiver host cannot specify multicast sources in its membership reports.
- Source 1, Source 2, and Source 3 send multicast packets to multicast groups in the SSM group range 232.1.1.0/24.

Configure the IGMP SSM mapping feature on Switch D so that the receiver host can receive multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

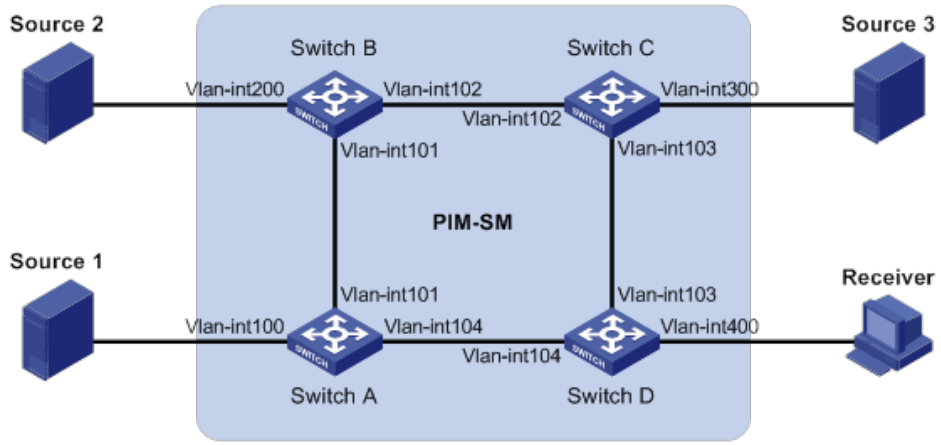


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	133.133.1.1/24	Source 3	—	133.133.3.1/24
Source 2	—	133.133.2.1/24	Receiver	—	133.133.4.1/24
Switch A	Vlan-int100	133.133.1.2/24	Switch C	Vlan-int300	133.133.3.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Vlan-int103	192.168.3.1/24
Switch A	Vlan-int104	192.168.4.2/24	Switch C	Vlan-int102	192.168.2.2/24
Switch B	Vlan-int200	133.133.2.2/24	Switch D	Vlan-int400	133.133.4.2/24
Switch B	Vlan-int101	192.168.1.2/24	Switch D	Vlan-int103	192.168.3.2/24
Switch B	Vlan-int102	192.168.2.1/24	Switch D	Vlan-int104	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches in the PIM-SM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP:

   # On Switch D, enable IP multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] multicast routing
   [SwitchD-mrib] quit
   ```

   # Enable IGMPv3 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] igmp enable
   [SwitchD-Vlan-interface400] igmp version 3
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable PIM-SM on the other interfaces.

   ```
   [SwitchD] interface vlan-interface 103
   [SwitchD-Vlan-interface103] pim sm
   [SwitchD-Vlan-interface103] quit
   [SwitchD] interface vlan-interface 104
   [SwitchD-Vlan-interface104] pim sm
   [SwitchD-Vlan-interface104] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] pim sm
   [SwitchA-Vlan-interface100] quit
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 104
   [SwitchA-Vlan-interface104] pim sm
   [SwitchA-Vlan-interface104] quit
   ```

   # Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

   # On Switch D, specify 232.1.1.0/24 as the SSM group range.

   ```
   [SwitchD] acl basic 2000
   [SwitchD-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
   [SwitchD-acl-ipv4-basic-2000] quit
   [SwitchD] pim
   [SwitchD-pim] ssm-policy 2000
   [SwitchD-pim] quit
   ```

   # Configure the SSM group range on Switch A, Switch B, and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure IGMP SSM mappings on Switch D.

```
[SwitchD] igmp
[SwitchD-igmp] ssm-mapping 133.133.1.1 2000
[SwitchD-igmp] ssm-mapping 133.133.3.1 2000
[SwitchD-igmp] quit
```

Verifying the configuration

Display IGMP SSM mappings for multicast group 232.1.1.1 on Switch D.

```
[SwitchD] display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        133.133.1.1
        133.133.3.1
```

On Switch D, display information about IGMP multicast groups that hosts have dynamically joined.

```
[SwitchD] display igmp group
IGMP groups in total: 1
 Vlan-interface400(133.133.4.2):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   232.1.1.1       133.133.4.1     00:02:04    off
```

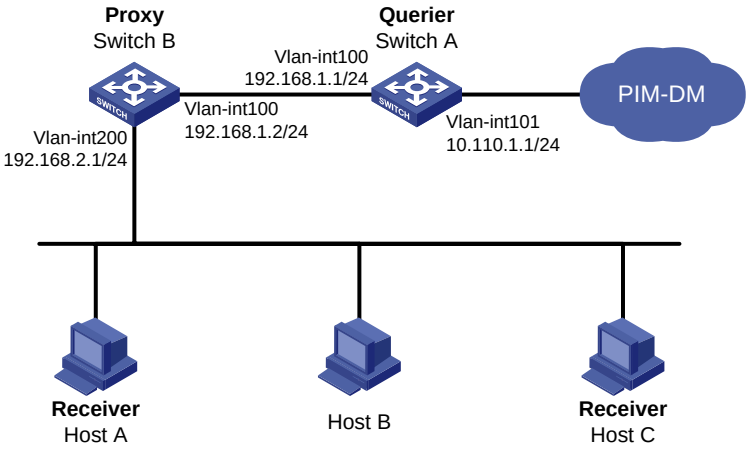
Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (133.133.1.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: 192.168.4.2
         RPF prime neighbor: 192.168.4.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -

 (133.133.3.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.3.1
         RPF prime neighbor: 192.168.3.1
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -
```

Example: Configuring IGMP proxying



Network configuration

As shown in Figure 7:

- PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information sent to multicast group 224.1.1.1.

Configure the IGMP proxying feature on Switch B so that Switch B can maintain group memberships and forward multicast traffic without running PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Enable IP multicast routing, PIM-DM, IGMP, and IGMP proxying:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   ```

```
[SwitchB-Vlan-interface100] igmp proxy enable
[SwitchB-Vlan-interface100] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] igmp enable
[SwitchB-Vlan-interface200] quit
```

Verifying the configuration

Display multicast group membership information maintained by the IGMP proxy on Switch B.

```
[SwitchB] display igmp proxy group
IGMP proxy group records in total: 1
 Vlan-interface100(192.168.1.2):
  IGMP proxy group records in total: 1
   Group address      Member state      Expires
   224.1.1.1          Delay             00:00:02
```

Troubleshooting IGMP

No membership information on the receiver-side device

Symptom

When a host sends a report for joining multicast group G, no membership information of multicast group G exists on the device closest to that host.

Solution

To resolve the problem:

1. Use the **`display igmp interface`** command to verify that the networking, interface connection, and IP address configuration are correct.
2. Use the **`display current-configuration`** command to verify that multicast routing is enabled. If it is not enabled, use the **`multicast routing`** command in system view to enable IP multicast routing. In addition, verify that IGMP is enabled on the associated interfaces.
3. Use the **`display igmp interface`** command to verify that the IGMP version on the interface is lower than that on the host.
4. Use the **`display current-configuration interface`** command to verify that no multicast group policies have been configured to filter IGMP reports for multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different IGMP devices on the same subnet.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to verify the IGMP information on the interfaces. Make sure the devices on the subnet have the same IGMP settings on their interfaces.

2. Use the **display igmp interface** command on all devices on the same subnet to verify the IGMP-related timer settings. Make sure the settings are consistent on all the devices.
3. Use the **display igmp interface** command to verify that all devices on the same subnet are running the same IGMP version.
4. If the problem persists, contact H3C Support.

PIM overview

Protocol Independent Multicast (PIM) provides IP multicast forwarding by leveraging unicast static routes or unicast routing tables generated by any unicast routing protocol. PIM uses the underlying unicast routing to generate a multicast routing table without relying on any particular unicast routing protocol. PIM uses the RPF mechanism to implement multicast forwarding. For more information about RPF, see "Configuring multicast routing and forwarding."

PIM modes

Based on the implementation mechanism, PIM includes the following modes:

- Protocol Independent Multicast–Dense Mode (PIM-DM).
- Protocol Independent Multicast–Sparse Mode (PIM-SM).
- Protocol Independent Multicast Source-Specific Multicast (PIM-SSM).

In this document, a PIM domain refers to a network that contains PIM devices.

PIM-DM

PIM-DM uses the push mode for multicast forwarding, and is suitable for small-sized networks with densely distributed multicast members.

PIM-DM assumes that all downstream nodes want to receive multicast data from a source, so multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees. When a pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In PIM-DM, the multicast forwarding paths for a multicast group constitutes a forwarding tree. The forwarding tree is rooted at the multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the multicast source to the receivers, it is also called a "shortest path tree (SPT)."

PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

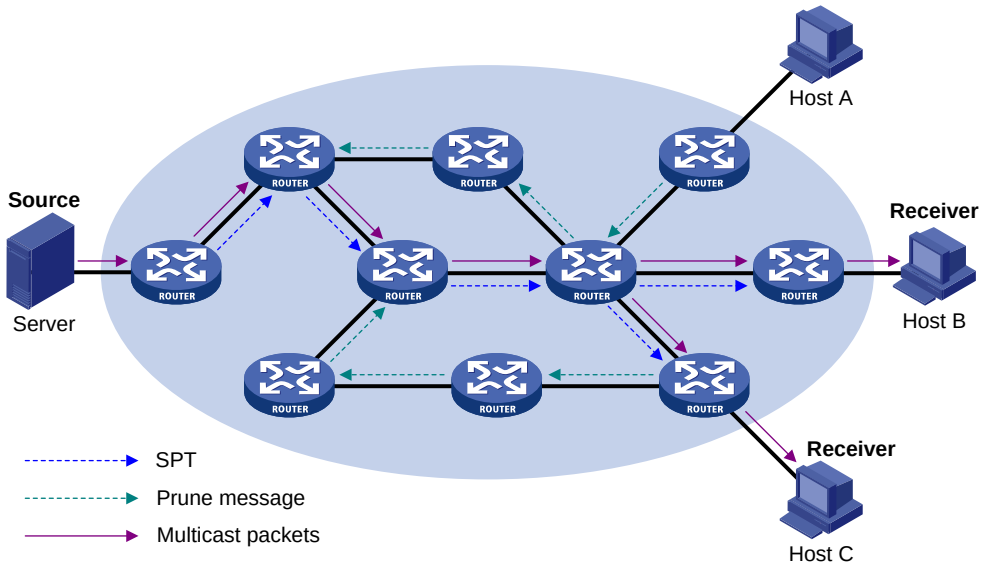
Neighbor discovery

In a PIM domain, each PIM interface on a device periodically multicasts PIM hello messages to all other PIM devices (identified by the address 224.0.0.13) on the local subnet. Through the exchanging of hello messages, all PIM devices on the subnet determine their PIM neighbors, maintain PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In a PIM-DM domain, the multicast data from the multicast source S to the multicast group G is flooded throughout the domain. A device performs an RPF check on the multicast data. If the RPF check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes on the network. In the flooding process, all the devices in the PIM-DM domain create the (S, G) entry.
2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all PIM devices on the subnet. When an upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In



this way, the upstream stream node stops forwarding subsequent packets addressed to that multicast group down to this node.

NOTE:

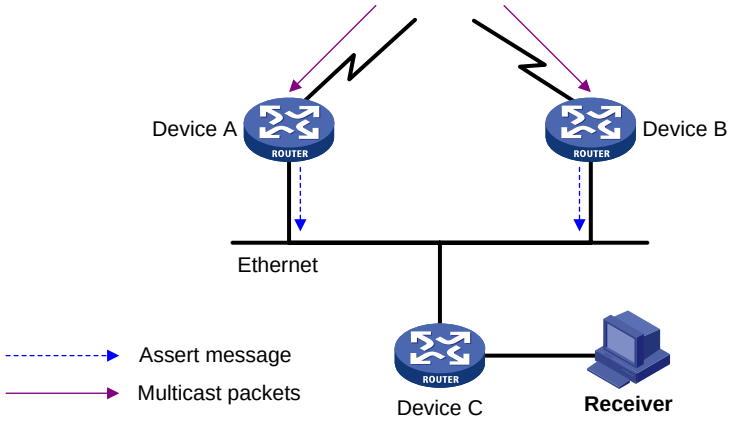
An (S, G) entry contains a multicast source address S, a multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the multicast source. This prune process goes on until only necessary branches are left in the PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all PIM devices (224.0.0.13) on the local subnet through the interface that received the packet. The assert message contains the multicast source address (S), the multicast group address (G), and the metric preference and metric of the unicast route/static multicast route to the multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the shared-media LAN. The comparison process is as follows:

1. The device with a higher metric preference to the multicast source wins.
2. If both devices have the same metric preference, the device with a smaller metric wins.
3. If both devices have the same metric, the device with a higher IP address on the downstream interface wins.

PIM-SM

PIM-DM uses the flood-and-prune cycles to build SPTs for multicast data forwarding. Although an SPT has the shortest paths from the multicast source to the receivers, it is built with a low efficiency. Therefore, PIM-DM is not suitable for large and medium-sized networks. PIM-SM uses the pull mode for multicast forwarding, and it is suitable for large- and medium-sized networks with sparsely and widely distributed multicast group members.

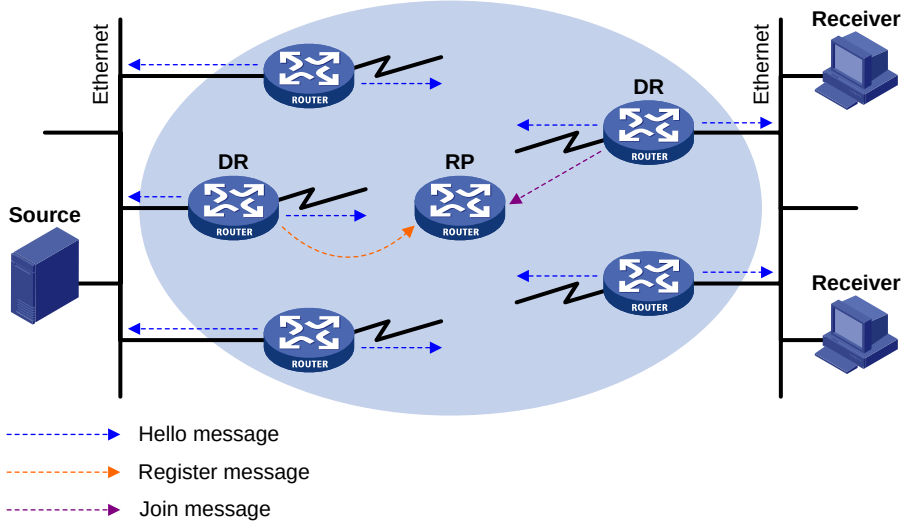
PIM-SM assumes that no hosts need multicast data. A multicast receiver must express its interest in the multicast data for a multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of a PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement multicast data forwarding. An SPT is rooted at the multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

PIM-SM uses the same neighbor discovery mechanism as PIM-DM does. For more information, see "Neighbor discovery."

DR election



A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the multicast receivers to send join messages to the RP.

PIM-DM does not require a DR. However, if IGMPv1 runs on any shared-media LAN in a PIM-DM domain, a DR must be elected to act as the IGMPv1 querier for the LAN. For more information about IGMP, see "Configuring IGMP."

IMPORTANT:

IGMP must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any multicast groups.

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IP address wins the DR election under one of following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its PIM neighbor lifetime expires and the other devices will initiate to elect a new DR.

RP discovery

An RP is the core of a PIM-SM domain. A multicast group can have only one RP for multicast forwarding, and an RP can be designated to multiple multicast groups.

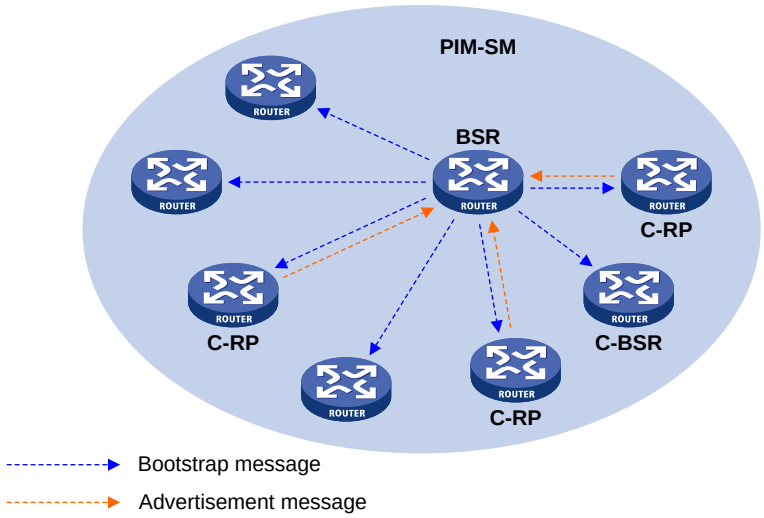
RP selection

An RP can be statically configured or dynamically elected. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.

- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs



A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election

Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to a multicast group.
- **BSR**—A BSR is the core of the administrative core of the PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. A PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

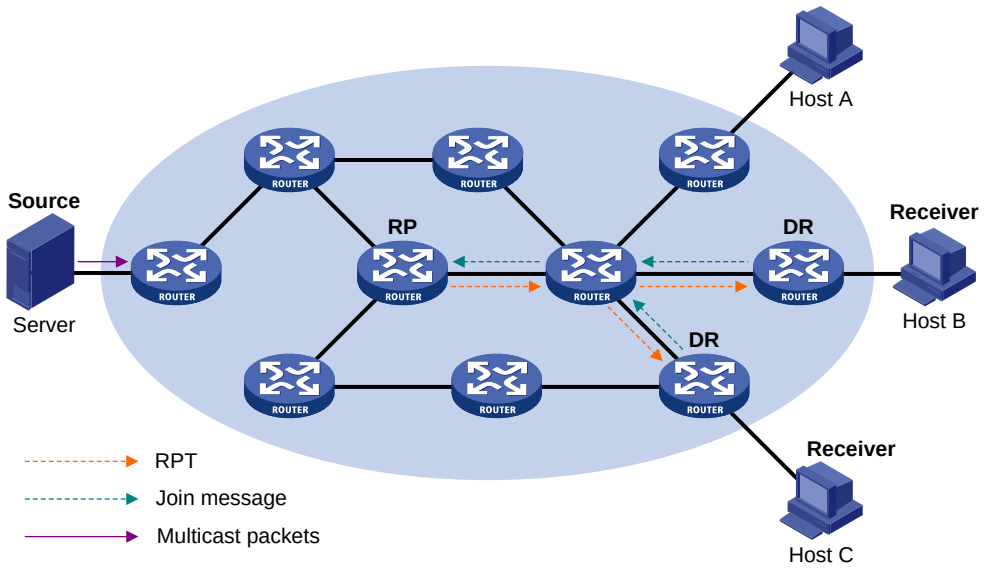
1. Each C-BSR sends a bootstrap message (BSM) to other devices in the PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IP address wins. The loser uses the winner's BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.
3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the multicast group range to which it is designated.
4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between multicast groups and RPs. The BSR encapsulates the RP-set information in the bootstrap messages (BSMs) and floods the BSMs to the entire PIM-SM domain.
5. All devices in the PIM-SM domain select an RP for a multicast group based on the following rules:
   a. The C-RP that is designated to the smallest multicast group range wins.

b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.

c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.

d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Anycast RP



PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IP address. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:

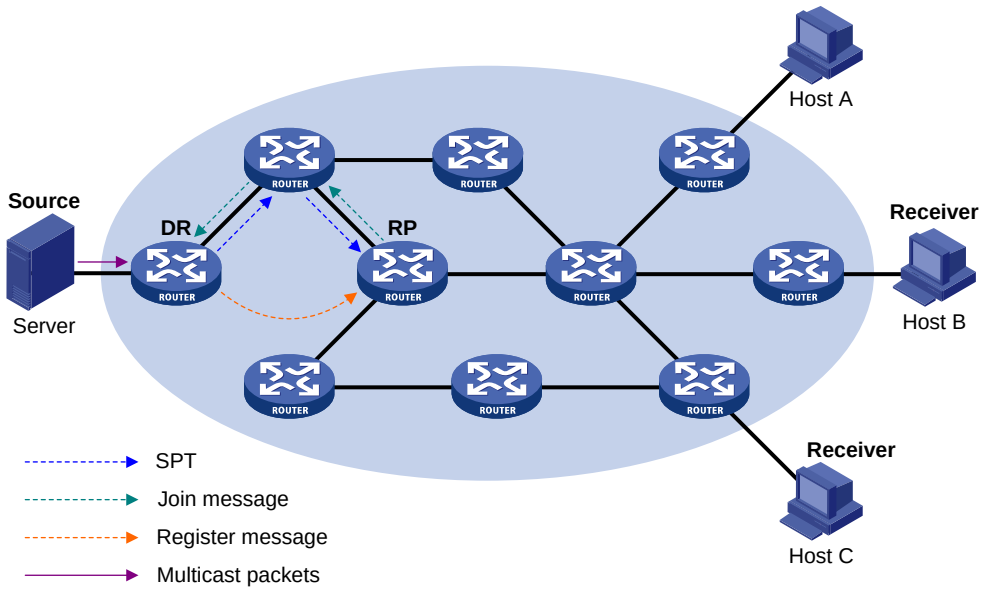
- **Optimal RP path**—A multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

RPT building

Figure 5 RPT building in a PIM-SM domain

As shown in Figure 5, the process of building an RPT is as follows:

1. When a receiver wants to join the multicast group G, it uses an IGMP message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any multicast source. The RP is the root of the RPT, and the DR is a leaf of the RPT.



When the multicast data addressed to the multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT, and finally to the receiver.

When a receiver is no longer interested in the multicast data addressed to the multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that multicast group. If no receivers for the multicast group exist, the device continues to forward the prune message to its upstream device.

Multicast source registration

The multicast source uses the registration process to inform an RP of its presence.

Figure 6 Multicast source registration

As shown in Figure 6, the multicast source registers with the RP as follows:

1. The multicast source S sends the first multicast packet to the multicast group G. When receiving the multicast packet, the source-side DR encapsulates the packet into a PIM register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates the register message and forwards the register message down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the multicast source. The devices along the path from the RP to the multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent multicast data from the multicast source are forwarded to the RP along the established SPT. When the multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

This section takes a router as an example. As compared with the switchover to SPT on a router, switchover to SPT is implemented in a simpler way on a switch.

In a PIM-SM domain, only one RP and one RPT provide services for a specific multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

Multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for a multicast packet might not be the shortest one.
- The RP might be overloaded by multicast traffic bursts.

To eliminate these weaknesses, PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives multicast traffic, it sends an (S, G) source-specific join message toward the multicast source. The routers along the path from the RP to the multicast source constitute an SPT. The subsequent multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

  For more information about the switchover to SPT initiated by the RP, see "Multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the multicast source. The routers along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the router where the RPT and the SPT branches, the router drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent multicast packets travel along the SPT from the multicast source to the receiver hosts.

With the switchover to SPT, PIM-SM builds SPTs more economically than PIM-DM does.

Assert

PIM-SM uses a similar assert mechanism as PIM-DM does. For more information, see "Assert."

Administrative scoping

Administrative scoping mechanism

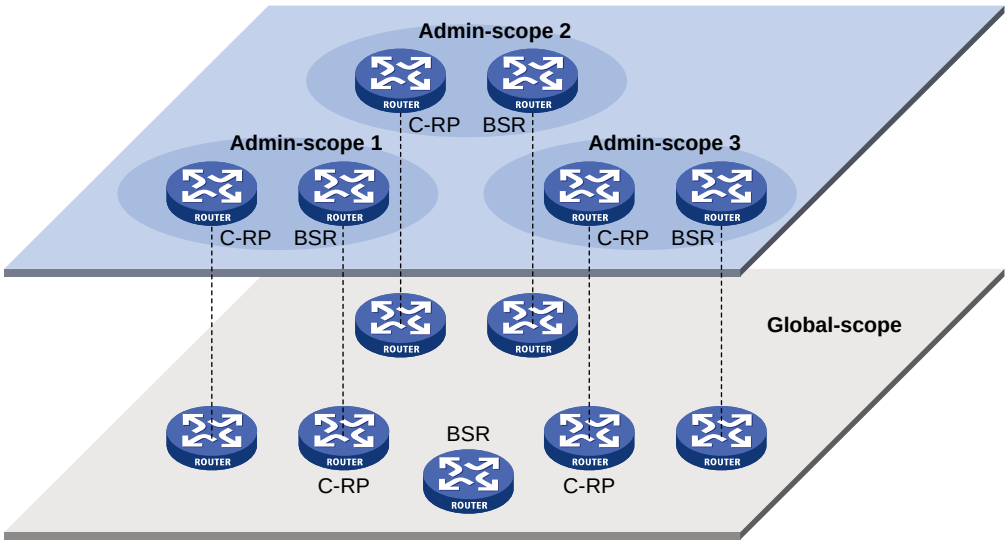
Administrative scoping mechanisms for PIM-SM include non-scoped BSR mechanism and administrative scoping mechanism.

- **Non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **Administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

Admin-scoped zones are divided for multicast groups. Zone border devices (ZBRs) form the boundary of an admin-scoped zone. Each admin-scoped zone maintains one BSR for multicast groups within a specific range. Multicast protocol packets, such as assert messages and BSMs, for a specific group range cannot cross the boundary of the admin-scoped zone for the group range.

Multicast group ranges that are associated with different admin-scoped zones can have intersections. However, the multicast groups in an admin-scoped zone are valid only within the local zone, and theses multicast groups are regarded as private group addresses.

The global-scoped zone maintains a BSR for the multicast groups that do not belong to any admin-scoped zones.



Relationship between admin-scoped zones and the global-scoped zone

The global-scoped zone and each admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each admin-scoped zone has its own boundary. The multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the global-scoped zone and admin-scoped zones based on geographical locations and multicast group address ranges.

- In view of geographical locations:

  An admin-scoped zone is a logical zone for particular multicast groups. The multicast packets for such multicast groups are confined within the local admin-scoped zone and cannot cross the boundary of the zone.

  Figure 7 Relationship in view of geographical locations

  As shown in Figure 7, for the multicast groups in a specific group address range, the admin-scoped zones must be geographically separated and isolated. A device cannot belong to multiple admin-scoped zones. An admin-scoped zone cannot contain a device that belongs to any other admin-scoped zone. However, the global-scoped zone includes all devices in the PIM-SM domain. Multicast packets that do not belong to any admin-scoped zones are forwarded in the entire PIM-SM domain.

- In view of multicast group address ranges:

  Each admin-scoped zone is designated to specific multicast groups, of which the multicast group addresses are valid only within the local zone. The multicast groups of different admin-scoped zones might have intersections. All the multicast groups other than those of the admin-scoped zones use the global-scoped zone.

Figure 8 Relationship in view of multicast group address ranges

As shown in Figure 8, the admin-scoped zones 1 and 2 have no intersection, but the admin-scoped zone 3 is a subset of the admin-scoped zone 1. The global-scoped zone provides services for all the multicast groups that are not covered by the admin-scoped zones 1 and 2, G—G1—G2 in this case.

PIM-SSM

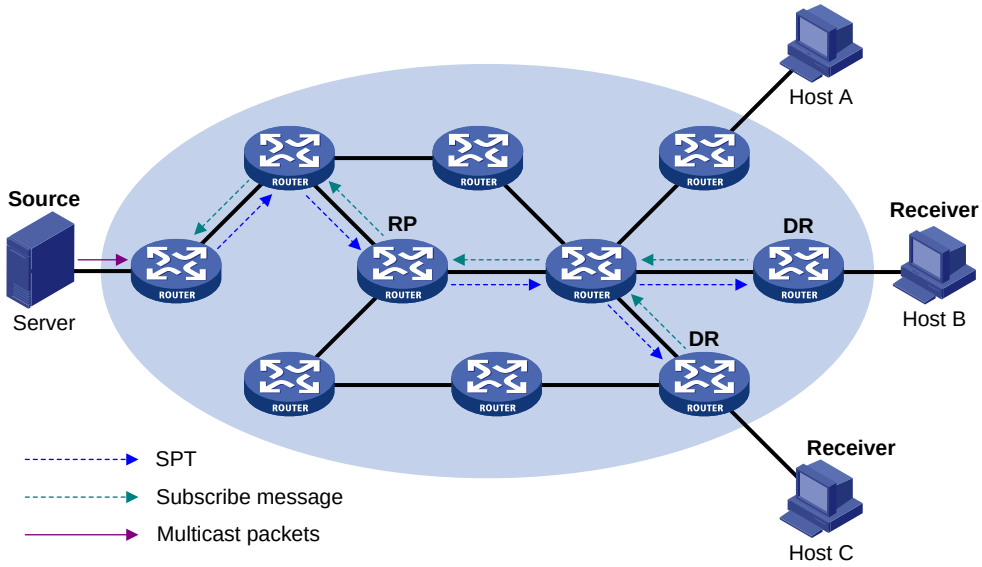
The ASM model includes PIM-DM and PIM-SM. The SSM model can be implemented by leveraging part of the PIM-SM technique. It is also called "PIM-SSM."

The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through IGMPv3.

In actual applications, part of IGMPv3 and PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located a multicast source, no RP or RPT is required. Multicast sources do not register with the RP, and the MSDP is not needed for discovering multicast sources in other PIM domains.

PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery



PIM-SSM uses the same neighbor discovery mechanism as PIM-SM. For more information, see "Neighbor discovery."

DR election

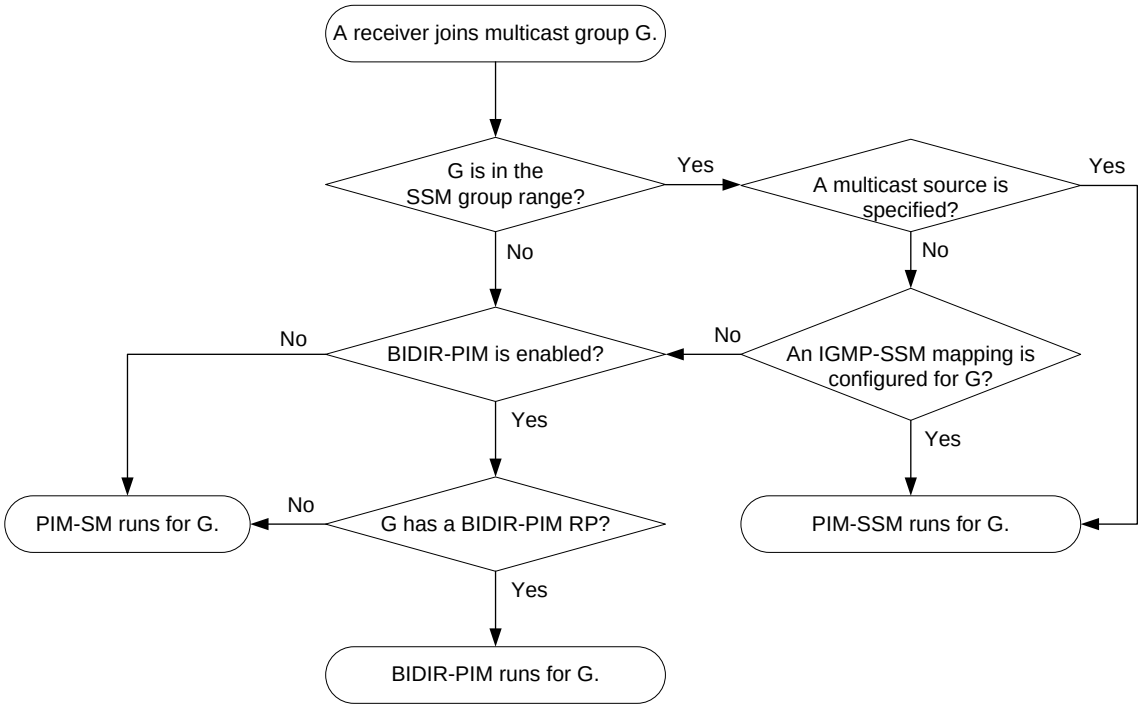
PIM-SSM uses the same DR election mechanism as PIM-SM. For more information, see "DR election."

SPT building

Figure 9 SPT building in PIM-SSM

As shown in Figure 9, an SPT is built as follows:

1. Host B and Host C are receivers. They send IGMPv3 report messages to their DRs to express their interest in the multicast information that the multicast source S sends to the multicast group G.
2. After receiving a report message, the DR sends a subscribe message hop by hop toward the multicast source S. All devices along the path from the DR to the source create an (S, G) entry to build an SPT. The SPT is rooted at the multicast source S and has the receivers as its leaves. This SPT is the transmission channel in PIM-SSM.



In PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among PIM protocols

In a PIM network, PIM-DM cannot run together with PIM-SM, BIDIR-PIM, or PIM-SSM. However, PIM-SM, BIDIR-PIM, and PIM-SSM can run together. (BIDIR-PIM is not supported in the current software version.) Figure 10 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about IGMP SSM mapping, see "Configuring IGMP."

Figure 10 Relationship among PIM protocols

PIM support for VPNs

To support PIM for VPNs, a multicast device that runs PIM maintains an independent set of PIM neighbor table, multicast routing table, BSR information, and RP-set information for each VPN.

After receiving a multicast data packet, the multicast device checks which VPN the data packet belongs to. Then, the device forwards the packet according to the multicast routing table for that VPN or creates a multicast routing entry for that VPN.

Protocols and standards

Configuring PIM

Restrictions: Hardware compatibility with PIM

Only the S5136S-EI switch series supports PIM.

Restrictions and guidelines: PIM configuration

All the interfaces on a device must operate in the same PIM mode on the public network or the same VPN instance.

Configuring PIM-DM

PIM-DM tasks at a glance

To configure PIM-DM, perform the following tasks:

1. Enabling PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the PIM-DM graft retry timer
4. (Optional.) Configuring common PIM timers

Prerequisites for PIM-DM

Before you configure PIM-DM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-DM

About this task

With PIM-DM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-DM on all non-border interfaces of the devices when you deploy a PIM-DM domain.

For PIM-DM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]

By default, IP multicast routing is disabled.

For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable PIM-DM.

   pim dm

   By default, PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the PIM device directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. It prevents the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can configure the time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own PIM-DM state, and resets the waiting timer.
- **TTL value of state refresh messages**—The TTL value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the TTL value comes down to 0. A state refresh message with a large TTL value might cycle on a small network.

  To effectively control the propagation scope of state refresh messages, configure an appropriate TTL value based on the network size on the device directly connected with the multicast source.

Restrictions and guidelines

Perform this task on all devices in the PIM-DM domain.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the state refresh feature.

   pim state-refresh-capable

   By default, the state refresh feature is enabled.

4. Return to system view.

   quit

5. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

6. Set the state refresh interval.

state-refresh-interval *interval*

The default setting is 60 seconds.

Perform this task on the device directly connected to the multicast source.

7. Set the amount of time that the device must wait to accept a new state refresh message.

   state-refresh-rate-limit *time*

   The default setting is 30 seconds.

8. Set the TTL value of state refresh messages.

   state-refresh-ttl *ttl-value*

   The default setting is 255.

Setting the PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the graft retry timer.

   pim timer graft-retry *interval*

   The default setting is 3 seconds.

Configuring PIM-SM

PIM-SM tasks at a glance

To configure PIM-SM, perform the following tasks:

1. Enabling PIM-SM
2. Configuring static RPs

   As a best practice, configure a static RP when only one dynamic RP exists in the network.

3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring a PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple PIM devices exist in the network.

   You can configure static RPs, dynamic RPs, or both.

4. (Optional.) Enabling Auto-RP listening
5. (Optional.) Configuring Anycast RP

6. (Optional.) Configuring multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common PIM features

Prerequisites for PIM-SM

Before you configure PIM-SM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-SM

About this task

With PIM-SM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SM domain.

For PIM-SM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable PIM-SM.
   `pim sm`
   By default, PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth because of frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In a PIM-SM domain, you can configure the same static RP for different multicast groups by using the same RP address but different ACLs.

You do not need to enable PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for a multicast group, only the static RP with the highest IP address takes effect.

The static RP configuration must be the same on all devices in the PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP.

   static-rp *rp-address* [{ *ipv4-acl-number* | **name** *ipv4-acl-number* } | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword in the **static-rp** command to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the PIM-SM domain because every C-BSR might become the BSR.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv4-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses. It is used to prevent the legal BSR from being replaced by a malicious host.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-BSRs and other devices.

The C-BSR configuration on the devices in the PIM-SM domain must be the same.

For a successful RPF check, configure static multicast routes to ensure that the next hop to a C-BSR is a tunnel interface when C-BSRs connect to other PIM devices through tunnels. For more information about static multicast routes, see "Configuring multicast routing and forwarding."

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv4-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits BSMs from the BSR for 130 seconds before sending BSMs.

Configuring a PIM domain border

About this task

A PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different PIM-SM domains.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a PIM domain border.
   pim bsr-boundary
   By default, an interface is not a PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.
   undo bsm-fragment enable
   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.
   undo bsm-reflection enable
   By default, the device forwards BSMs out of their incoming interfaces.

Enabling Auto-RP listening

About this task

This feature enables the device to receive Auto-RP announcement and discovery messages and learn RP information. The destination IP addresses for Auto-RP announcement and discovery messages are 224.0.1.39 and 224.0.1.40, respectively.

Restrictions and guidelines

After this feature is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Enable Auto-RP listening.
   auto-rp enable
   By default, Auto-RP listening is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IP address. The IP address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IP address of a loopback interface as the RP member address.

If you configure IP addresses of multiple interfaces on the same device as RP member addresses, the lowest IP address takes effect. The rest of the interface addresses become backup RP member addresses.

An Anycast RP address must be a host address with subnet mask 255.255.255.255.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RP or C-RPs in the PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *anycast-rp-address member-rp-address*

By default, Anycast RP is not configured.

You can repeat this command to add multiple RP member addresses to the Anycast RP set.

Configuring multicast source registration

About this task

- **PIM register policy**—A PIM register policy enables an RP to filter register messages by using an ACL that specifies the multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time—**The source-side DR stops sending register messages encapsulated with multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. Otherwise, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is fixed to 5 seconds. You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure a PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a PIM register policy.

   register-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM register policy is configured. All PIM register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate multicast data in register messages destined to the RP. As a best practice to avoid multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure RPT to SPT switchover.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

   By default, the first multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring PIM-SSM

PIM-SSM tasks at a glance

To configure PIM-SSM, perform the following tasks:

1. Enabling PIM-SM

2. (Optional.) Configuring the SSM group range
3. (Optional.) Configuring the delay time for DR election
4. (Optional.) Configuring common PIM features

Prerequisites for PIM-SSM

Before you configure PIM-SSM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable PIM-SM.
- Enable IGMPv3 on PIM devices that connect to multicast receivers.

Enabling PIM-SM

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SSM domain.

Procedure

1. Enter system view.
   system-view
2. Enable multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-SM.
   pim sm
   By default, PIM-SM is disabled.

Configuring the SSM group range

About this task

When a PIM-SM enabled interface receives a multicast packet, it checks whether the multicast group address of the packet is in the SSM group range. If the multicast group address is in this range, the PIM mode for this packet is PIM-SSM. If the multicast group address is not in this range, the PIM mode is PIM-SM.

Restrictions and guidelines

Configure the same SSM group range on all devices in the entire PIM-SSM domain. Otherwise, multicast information cannot be delivered through the SSM model.

When a member of a multicast group in the SSM group range sends an IGMPv1 or IGMPv2 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the SSM group range.
   ssm-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }
   By default, the SSM group range is 232.0.0.0/8.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the delay time for DR election.
   pim timer dr-elect-delay *delay-time*
   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common PIM features

Common PIM feature tasks at a glance

All the following tasks are optional.

- Configuring a multicast source policy
- Configuring a PIM hello policy
- Configuring PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common PIM timers

- Setting the maximum size of a join or prune message
- Configuring a PIM join policy
- Setting the DSCP value for outgoing PIM protocol packets
- Enabling BFD for PIM
- Enabling PIM passive mode
- Enabling PIM NSR
- Enabling SNMP notifications for PIM
- Enabling PIM logging
- Enabling log message suppression for PIM

Configuring a multicast source policy

About this task

This feature enables the device to filter multicast data by using an ACL that specifies the multicast sources and the optional groups. It filters not only data packets but also register messages with multicast data encapsulated. It controls the information available to downstream receivers.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a multicast source policy.

   source-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no multicast source policy is configured. The device does not filter multicast data packets.

Configuring a PIM hello policy

About this task

This feature enables the device to filter PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against PIM message attacks and to establish correct PIM neighboring relationships.

If hello messages of an existing PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure a PIM hello policy.

   pim neighbor-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM hello policy is configured on an interface. All PIM hello messages are regarded as legal.

Configuring PIM hello message options

About this task

In either a PIM-DM domain or a PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the multicast source or the receivers.
- **Holdtime**—PIM neighbor lifetime. If a device does not receive a hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the PIM message propagation delay. The override interval defines a period for a device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different PIM devices on a shared-media LAN are different, the largest ones apply.

If you want to enable neighbor tracking, you must enable it on all PIM devices on a shared-media LAN. Otherwise, the upstream device cannot track join messages from every downstream devices.

You can configure hello message options for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

Configuring hello message options globally

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.

   hello-option dr-priority *priority*

   The default setting is 1.
4. Set the neighbor lifetime.

   hello-option holdtime *time*

   The default setting is 105 seconds.
5. Set the PIM message propagation delay for a shared-media LAN.

hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the DR priority.

   pim hello-option dr-priority *priority*

   The default setting is 1.

4. Set the neighbor lifetime.

   pim hello-option holdtime *time*

   The default setting is 105 seconds.

5. Set the PIM message propagation delay.

   pim hello-option lan-delay *delay*

   The default setting is 500 milliseconds.

6. Set the override interval.

   pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with PIM. The generation ID is a random value, but it changes only when the status of the device changes. If a PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

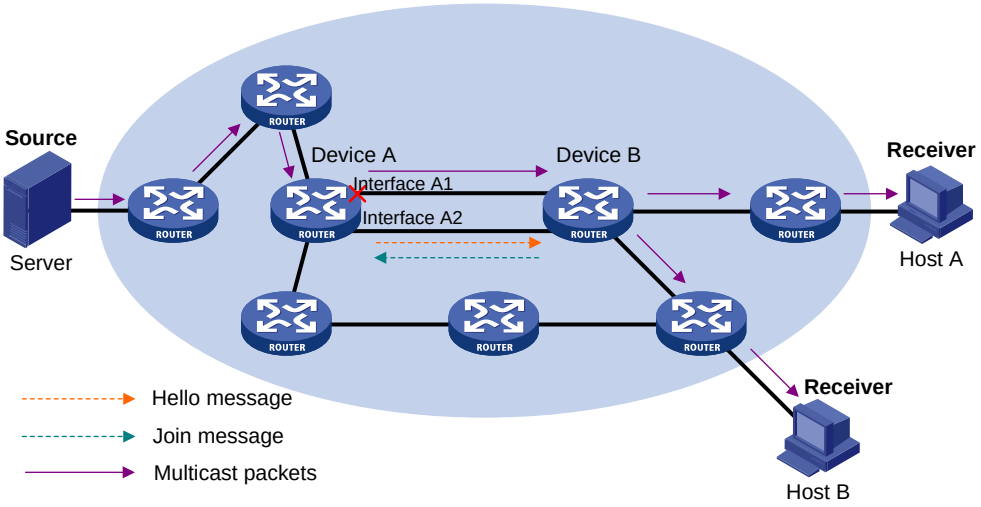
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

pim require-genid

By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 11, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send a PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 11 Network diagram

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to send hello messages with a different Generation ID upon a port state change.

   pim triggered-hello enable { **port-down** | **port-up** } *

   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common PIM timers

About this task

The following are common PIM timers:

- **Hello interval**—Interval at which a PIM device sends hello messages to discover PIM neighbors, and maintain PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, a PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join/Prune interval**—Interval at which a PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which a PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is specified in a join or prune message.
- **Multicast source lifetime**—Lifetime that a PIM device maintains for a multicast source. If a device does not receive subsequent multicast data from the multicast source S when the timer expires, it deletes the (S, G) entry for the multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common PIM timers for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common PIM timers globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.
   timer hello *interval*
   The default setting is 30 seconds.
4. Set the join or prune interval.
   timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.
   holdtime join-prune *time*
   The default setting is 210 seconds.
6. Set the multicast source lifetime.
   source-lifetime *time*
   The default setting is 210 seconds.

Configuring common PIM timers on an interface

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

About this task

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum size of a join or prune message.
   jp-pkt-size *size*
   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring a PIM join policy

About this task

The PIM join policy filters joined multicast sources and groups in PIM join or prune messages to protect the device against invalid PIM join or prune message attacks. The policy identifies valid joined multicast source and groups in PIM join or prune messages and filters out invalid joined multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined multicast sources and groups.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*

3. Configure a PIM join policy to filter joined multicast sources and groups in PIM join or prune messages.

   pim join-policy { { *ipv4-acl-number* | **name** *ipv4-acl-name* } | [**asm** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **ssm** { *ipv4-acl-number* | **name** *ipv4-acl-number* }] * }

   By default, no PIM join policy is configured and joined multicast sources and groups in PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing PIM protocol packets.

   dscp *dscp-value*

   By d efault, the DSCP value is 48 for outgoing PIM protocol packets.

Enabling BFD for PIM

About this task

If a DR on a shared-media network fails, a new DR election process does not start until the DR ages out. In addition, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, enable BFD for PIM to detect link failures among PIM neighbors.

You must enable BFD for PIM on all PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for PIM.

   pim bfd enable

   By default, BFD is disabled for PIM.

Enabling PIM passive mode

About this task

To guard against PIM hello spoofing, you can enable PIM passive mode on a receiver-side interface. The PIM passive interface cannot receive or forward PIM protocol messages (excluding register,

register-stop, and C-RP-Adv messages), and it acts as the DR on the subnet. In BIDIR-PIM, it also acts as the DF.

Restrictions and guidelines

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple PIM devices.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable PIM passive mode on the interface.
   pim passive
   By default, PIM passive mode is disabled on an interface.

Enabling PIM NSR

About this task

This feature enables PIM to back up protocol state information and data, including PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable PIM NSR.
   pim non-stop-routing
   By default, PIM NSR is disabled.
3. (Optional.) Specify a reserved VLAN for the peer link in an M-LAG system.
   m-lag peer-link reserved
   By default, no reserved VLAN is specified for the peer link in an M-LAG system.
   Execute this command in the view of the VLAN to be specified as the reserved VLAN. For more information about this command, see *Layer 2—LAN Switching Command Reference*.

Enabling SNMP notifications for PIM

About this task

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for PIM.
   snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **interface-election** | **invalid-join-prune** |

invalid-register | **neighbor-loss** | **private-interface-election** | **private-neighbor-loss** | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

By default, SNMP notifications for PIM are enabled.

Enabling PIM logging

About this task

To report critical PIM events to the information center, enable PIM logging. For PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable PIM logging or use the **pim log suppress** command to enable log message suppression for PIM.

Procedure

1. Enter system view.

   system-view
2. Enable PIM logging.

   pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *

   PIM logging is enabled by default.

Enabling log message suppression for PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for PIM. With this feature configured, the speed of sending PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure PIM logging has been enabled using the **pim log enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable log message suppression for PIM.

   pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *

   By default, log message suppression is enabled for PIM.

Display and maintenance commands for PIM

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description** | **down**]]
Display BSR information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by PIM.	**display pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*source-address*]
Display C-RP information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display PIM information on an interface.	**display pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]
Display PIM neighbor information.	**display pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display PIM routing entries.	**display pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* |**extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *
Display RP information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **rp-info** [*group-address*]
Display statistics for PIM packets.	**display pim statistics**

PIM configuration examples

Example: Configuring PIM-DM

Network configuration

As shown in Figure 12:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the dense mode.
- Host A and Host C are multicast receivers on two stub networks.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 12 Network diagram

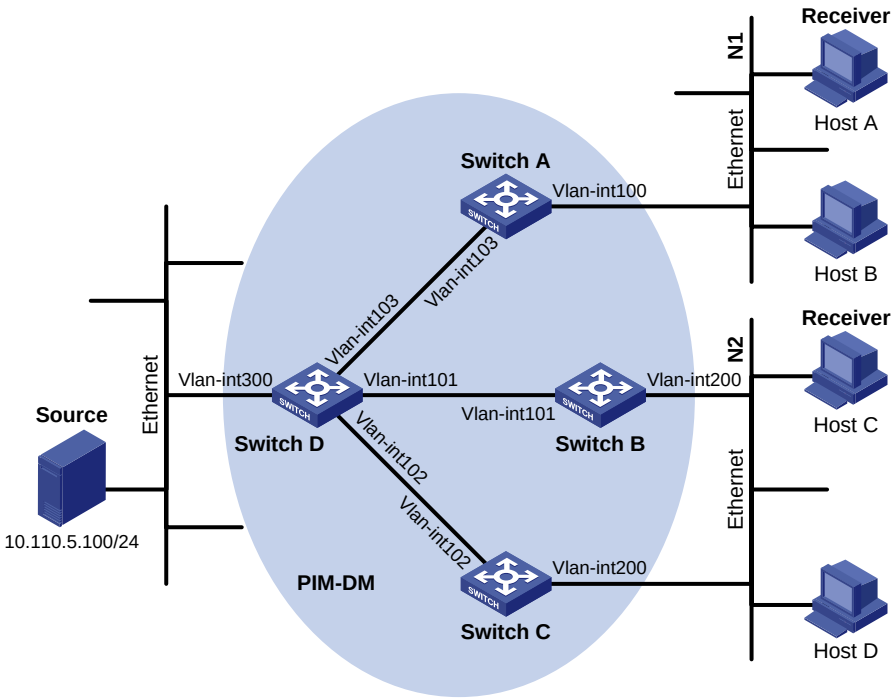


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int102	192.168.3.1/24
Switch A	Vlan-int103	192.168.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch B	Vlan-int200	10.110.2.1/24	Switch D	Vlan-int103	192.168.1.2/24
Switch B	Vlan-int101	192.168.2.1/24	Switch D	Vlan-int101	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch D	Vlan-int102	192.168.3.2/24

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 12, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
```

```
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing, IGMP, and PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IP multicast routing, and enable PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display PIM information on Switch D.

```
[SwitchD] display pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: 10.110.5.1 (local)
 Interface: Vlan103
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2 (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.2.2 (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.3.2 (local)
```

Display PIM neighboring relationships on Switch D.

```
[SwitchD] display pim neighbor
 Total pim neighbors: 3
  Neighbor: 192.168.1.1
    Interface: Vlan103
    Uptime: 00:02:22
```

```
    Expiry time: 00:01:27
    DR priority: 1
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan101
    Uptime: 00:00:22
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan102
    Uptime: 00:00:23
    Expiry time: 00:01:31
    DR priority: 5
    Mode: N/A
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from multicast source 10.110.5.100/24 to multicast group 225.1.1.1. (Details not shown.)

Display PIM routing entries on Switch A.

```
[SwitchA] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: igmp, UpTime: 00:04:25, Expires: -

 (10.110.5.100, 225.1.1.1)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:06:14
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.1.2
         RPF prime neighbor: 192.168.1.2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 225.1.1.1)
```

```
Protocol: pim-dm, Flag: LOC ACT
UpTime: 00:03:27
Upstream interface: Vlan-interface300
    Upstream neighbor: NULL
    RPF prime neighbor: NULL
Downstream interface(s) information:
Total number of downstream interfaces: 2
    1: Vlan-interface103
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
    2: Vlan-interface102
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has the correct (*, G) entry.

Example: Configuring non-scoped PIM-SM

Network configuration

As shown in Figure 13:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist on each stub network.
- The entire PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers on two stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to multicast group range 225.1.1.0/24. Specify VLAN-interface 101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 13 Network diagram

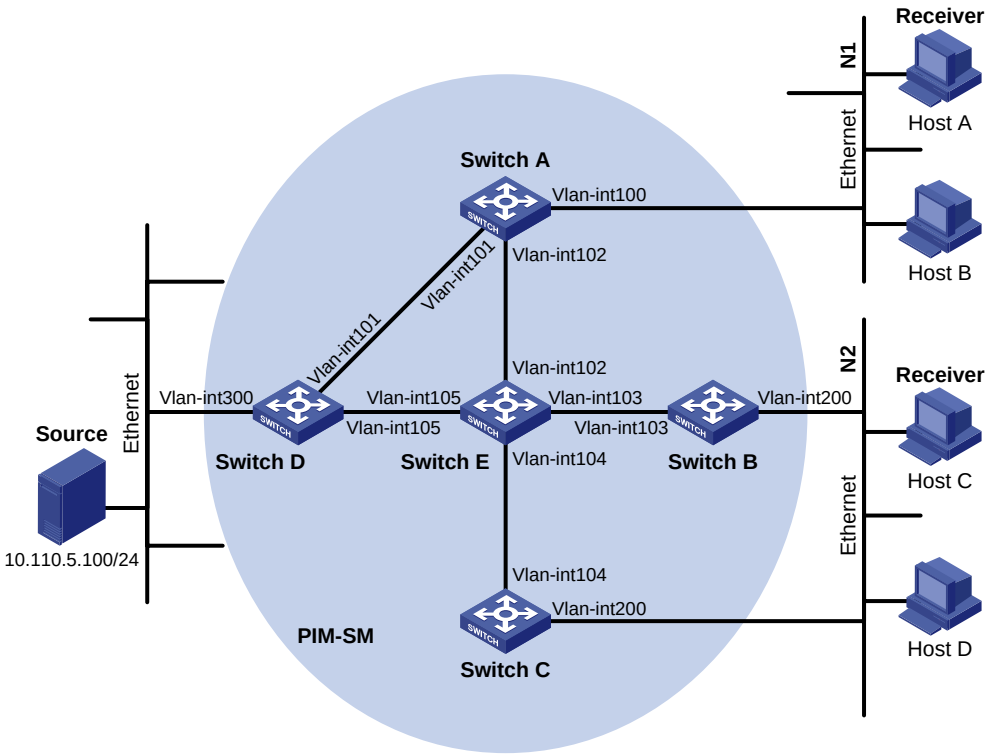

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 13, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and the static RP:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl basic 2005
[SwitchE-acl-ipv4-basic-2005] rule permit source 225.1.1.0 0.0.0.255
[SwitchE-acl-ipv4-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP.

```
[SwitchE] pim
[SwitchE-pim] c-bsr 192.168.9.2
[SwitchE-pim] c-rp 192.168.9.2 group-policy 2005
```

Configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE-pim] static-rp 192.168.1.2
[SwitchE-pim] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as the static RP.

```
<SwitchA> system-view
[SwitchA] pim
[SwitchA-pim] static-rp 192.168.1.2
[SwitchA-pim] quit
```

Configure the static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.9.2
```

Display BSR information on Switch A.

```
[SwitchA] display pim bsr-info
```

```
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
     Candidate BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch A.

```
[SwitchA] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 225.1.1.0/24
       RP address               Priority  HoldTime  Uptime    Expires
       192.168.9.2              192       180       00:51:45  00:02:22

Static RP information:
       RP address               ACL   Mode    Preferred
       192.168.1.2              ----  pim-sm  No
```

Example: Configuring admin-scoped PIM-SM

Network configuration

As shown in Figure 14:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The entire PIM-SM domain is divided into admin-scoped zone 1, admin-scoped zone 2, and the global-scoped zone. Switch B, Switch C, and Switch D are ZBRs of the three zones, respectively.
- Source 1 and Source 2 send different multicast data to the multicast group 239.1.1.1. Host A receives the multicast data only from Source 1, and Host B receives the multicast data only from Source 2. Source 3 sends multicast data to multicast group 224.1.1.1. Host C is a multicast receiver for the multicast group 224.1.1.1.
- VLAN-interface 101 of Switch B acts as a C-BSR and a C-RP for admin-scoped zone 1, and VLAN-interface 105 of Switch D acts as a C-BSR and a C-RP for admin-scoped zone 2. Both of the two interfaces are designated to multicast group range 239.0.0.0/8. VLAN-interface 109 of Switch F acts as a C-BSR and a C-RP for the global-scoped zone, and is designated to all the multicast groups that are not in the range 239.0.0.0/8.

- IGMPv2 runs between Switch A, Switch E, Switch I, and the receivers that directly connect to them, respectively.

Figure 14 Network diagram

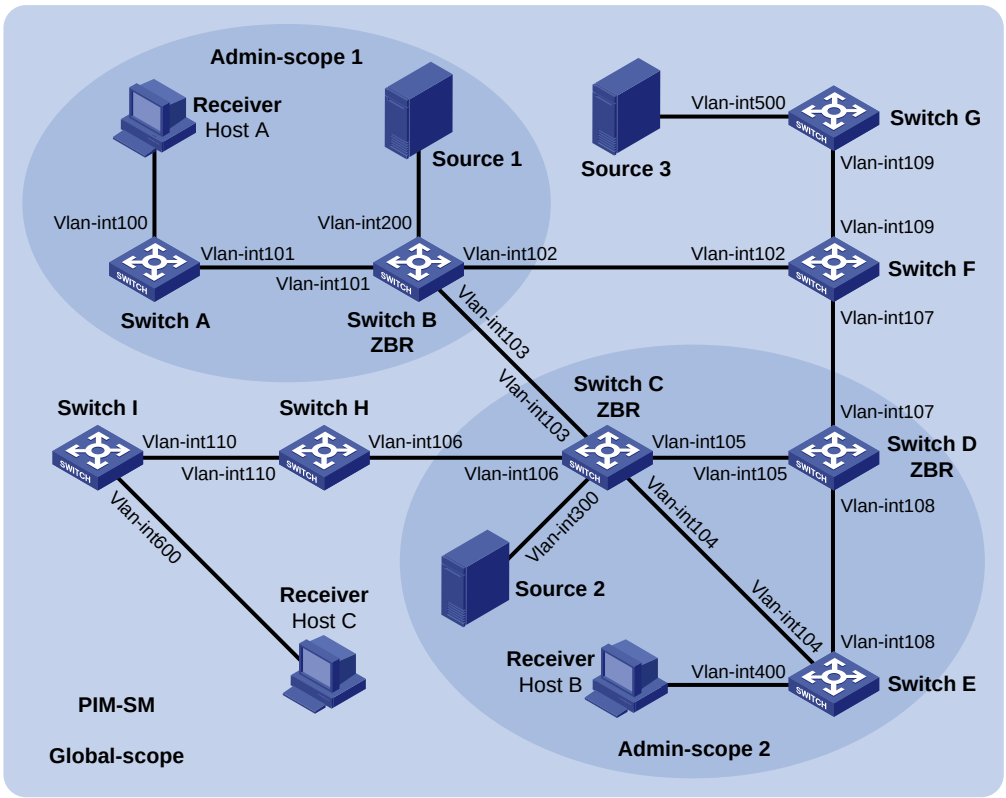

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	192.168.1.1/24	Switch D	Vlan-int105	10.110.5.2/24
Switch A	Vlan-int101	10.110.1.1/24	Switch D	Vlan-int108	10.110.7.1/24
Switch B	Vlan-int200	192.168.2.1/24	Switch D	Vlan-int107	10.110.8.1/24
Switch B	Vlan-int101	10.110.1.2/24	Switch E	Vlan-int400	192.168.4.1/24
Switch B	Vlan-int103	10.110.2.1/24	Switch E	Vlan-int104	10.110.4.2/24
Switch B	Vlan-int102	10.110.3.1/24	Switch E	Vlan-int108	10.110.7.2/24
Switch C	Vlan-int300	192.168.3.1/24	Switch F	Vlan-int109	10.110.9.1/24
Switch C	Vlan-int104	10.110.4.1/24	Switch F	Vlan-int107	10.110.8.2/24
Switch C	Vlan-int105	10.110.5.1/24	Switch F	Vlan-int102	10.110.3.2/24
Switch C	Vlan-int103	10.110.2.2/24	Switch G	Vlan-int500	192.168.5.1/24
Switch C	Vlan-int106	10.110.6.1/24	Switch G	Vlan-int109	10.110.9.2/24
Switch H	Vlan-int110	10.110.10.1/24	Source 1	—	192.168.2.10/24
Switch H	Vlan-int106	10.110.6.2/24	Source 2	—	192.168.3.10/24
Switch I	Vlan-int600	192.168.6.1/24	Source 3	—	192.168.5.10/24
Switch I	Vlan-int110	10.110.10.2/24			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 14, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 100).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on VLAN-interface 101.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch E and Switch I in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IP multicast routing, and enable PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] pim sm
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] pim sm
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim sm
[SwitchB-Vlan-interface103] quit
```

Enable IP multicast routing and PIM-SM on Switch C, Switch D, Switch F, Switch G, and Switch H in the same way Switch B is configured. (Details not shown.)

2. Configure admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 102 and VLAN-interface 103 as the boundaries of admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface103] quit
```

On Switch C, configure VLAN-interface 103 and VLAN-interface 106 as the boundaries of admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface103] quit
[SwitchC] interface vlan-interface 106
[SwitchC-Vlan-interface106] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface106] quit
```

On Switch D, configure VLAN-interface 107 as the boundary of admin-scoped zone 2.

```
<SwitchD> system-view
[SwitchD] interface vlan-interface 107
[SwitchD-Vlan-interface107] multicast boundary 239.0.0.0 8
[SwitchD-Vlan-interface107] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure the service scope of RP advertisements.

```
<SwitchB> system-view
[SwitchB] acl basic 2001
[SwitchB-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchB-acl-ipv4-basic-2001] quit
```

Configure VLAN-interface 101 as a C-BSR and a C-RP for admin-scoped zone 1.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 10.110.1.2 scope 239.0.0.0 8
[SwitchB-pim] c-rp 10.110.1.2 group-policy 2001
[SwitchB-pim] quit
```

On Switch D, configure the service scope of RP advertisements.

```
<SwitchD> system-view
[SwitchD] acl basic 2001
[SwitchD-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchD-acl-ipv4-basic-2001] quit
```

Configure VLAN-interface 105 as a C-BSR and a C-RP for admin-scoped zone 2.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 10.110.5.2 scope 239.0.0.0 8
[SwitchD-pim] c-rp 10.110.5.2 group-policy 2001
[SwitchD-pim] quit
```

On Switch F, configure VLAN-interface 109 as a C-BSR and a C-RP for the global-scoped zone.

```
<SwitchF> system-view
[SwitchF] pim
[SwitchF-pim] c-bsr 10.110.9.1
[SwitchF-pim] c-rp 10.110.9.1
[SwitchF-pim] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 10.110.9.1
```

```

```

Example: Configuring PIM-SSM

Network configuration

As shown in Figure 15:

- OSPF runs on the network.
- The receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the SSM mode.
- Host A and Host C are multicast receivers on two stub networks.
- The SSM group range is 232.1.1.0/24.
- IGMPv3 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 15 Network diagram

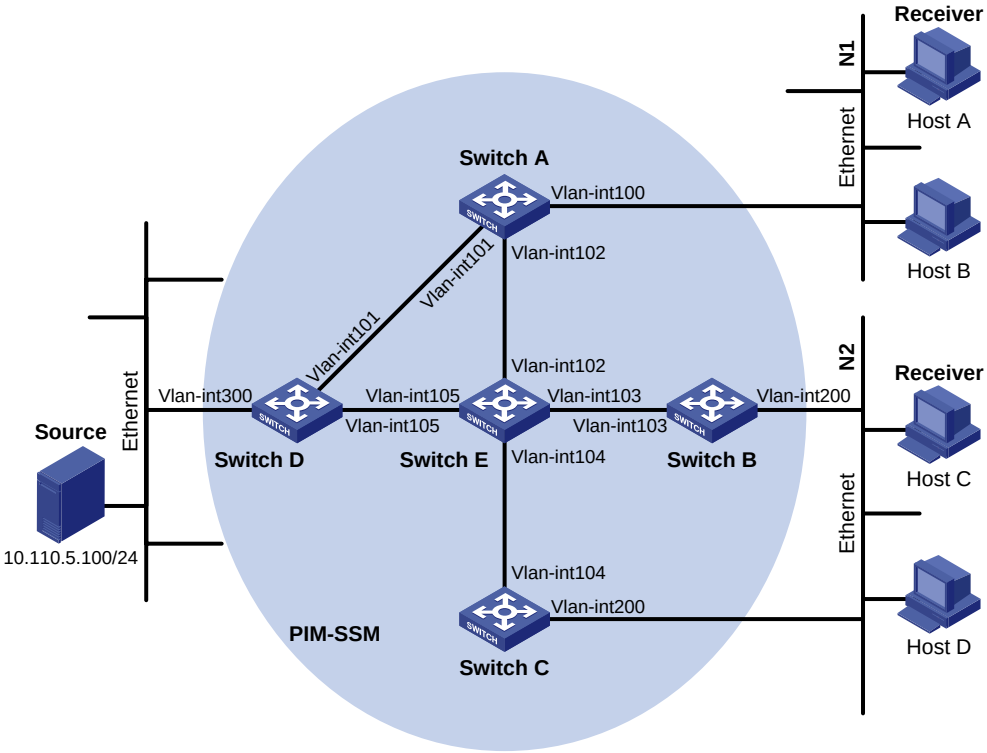

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 15, and configure OSPF on the switches in the PIM-SSM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMPv3 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] igmp version 3
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

Configure the SSM group range 232.1.1.0/24 on Switch A.

```
[SwitchA] acl basic 2000
[SwitchA-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchA-acl-ipv4-basic-2000] quit
[SwitchA] pim
[SwitchA-pim] ssm-policy 2000
[SwitchA-pim] quit
```

Configure the SSM group range on Switch B, Switch C, Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.9.2
```

Send an IGMPv3 report from Host A to join the multicast source and group (10.110.5.100/24, 232.1.1.1). (Details not shown.)

Display the PIM routing table on Switch A.

```
[SwitchA] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:13:25
     Upstream interface: Vlan-interface101
         Upstream neighbor: 192.168.1.2
```

```
        RPF prime neighbor: 192.168.1.2
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: igmp, UpTime: 00:13:25, Expires: 00:03:25
```

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
    Protocol: pim-ssm, Flag: LOC
    UpTime: 00:12:05
    Upstream interface: Vlan-interface300
        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface105
            Protocol: pim-ssm, UpTime: 00:12:05, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting PIM

A multicast distribution tree cannot be correctly built

Symptom

No multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in a PIM network. This means that a multicast distribution tree cannot be built correctly.

Solution

To resolve the problem:

1. Use the **`display ip routing-table`** command to verify that a unicast route to the multicast source or the RP is available.
2. Use the **`display pim interface`** command to verify PIM information on each interface, especially on the RPF interface. If PIM is not enabled on the interfaces, use the **`pim dm`** or **`pim sm`** command to enable PIM-DM or PIM-SM for the interfaces.
3. Use the **`display pim neighbor`** command to verify that the RPF neighbor is a PIM neighbor.
4. Verify that PIM and IGMP are enabled on the interfaces that directly connect to the multicast sources or the receivers.
5. Use the **`display pim interface verbose`** command to verify that the same PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **`display current-configuration`** command to verify that the same PIM mode is enabled on all devices. For PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

Multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives multicast data but does not create an (S, G) entry in the PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the multicast forwarding boundary settings. Use the **multicast boundary** command to change the multicast forwarding boundary settings to make the multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the multicast source.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the RP is available on each device.
2. Use the **display pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or multicast source registration fails in PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command on each device to view routing table information. Verify that unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display pim bsr-info** command to verify that the BSR information exists on each device.

3. Use the **display pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display pim neighbor** command to verify that PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

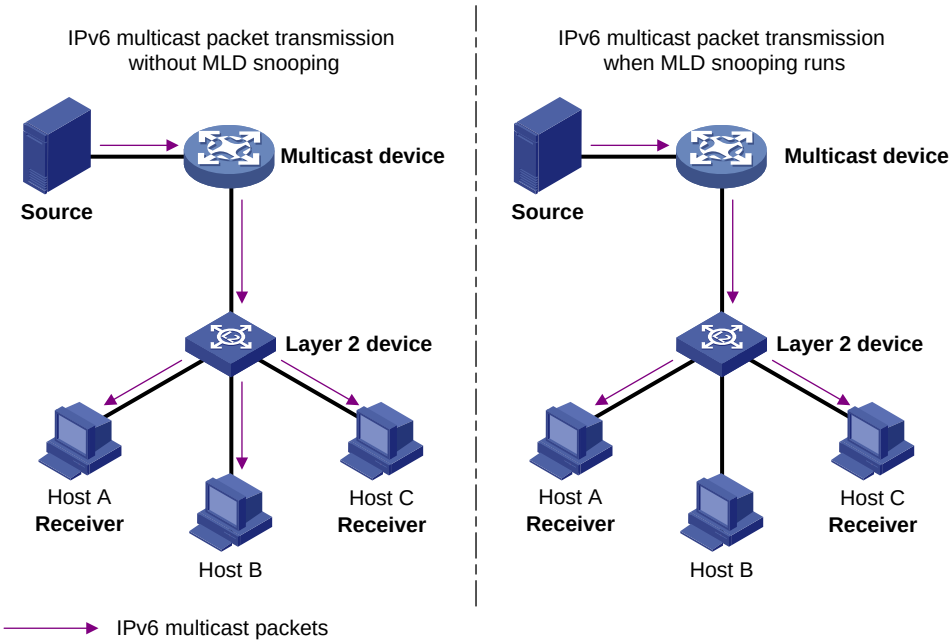
Configuring MLD snooping



About MLD snooping

MLD snooping runs on a Layer 2 device as an IPv6 multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from MLD messages that are exchanged between the hosts and the Layer 3 device.

Fundamentals of MLD snooping

As shown in Figure 1, when MLD snooping is not enabled, the Layer 2 switch floods IPv6 multicast packets all hosts in a VLAN. When MLD snooping is enabled, the Layer 2 switch forwards multicast packets of known IPv6 multicast groups to only the receivers.

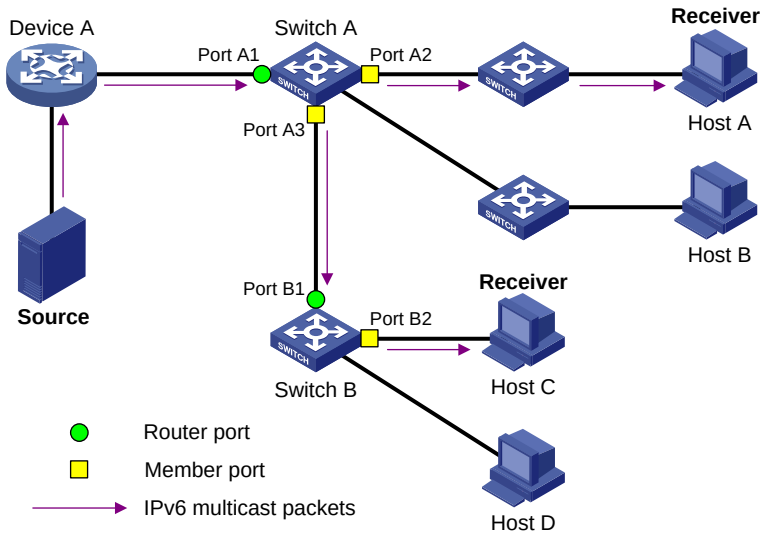


Figure 1 Multicast packet transmission processes without and with MLD snooping

MLD snooping ports

As shown in Figure 2, MLD snooping runs on Switch A and Switch B, and Host A and Host C are receiver hosts in an IPv6 multicast group. MLD snooping ports are divided into member ports and router ports.

Figure 2 MLD snooping ports

Router ports

On an MLD snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an MLD general query whose source address is not 0::0 or receives an IPv6 PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives an MLD general query whose source address is not 0::0 or an IPv6 PIM hello message before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in MLD snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in MLD snooping is a Layer 2 interface.

Member ports

On an MLD snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an MLD report, it is added to the associated dynamic MLD snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an MLD report before the timer expires, the timer is reset. If the port does not receive an MLD report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static MLD snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How MLD snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

MLD messages include general query, MLD report, and done message. An MLD snooping-enabled Layer 2 device performs differently depending on the MLD message types.

General query

The MLD querier periodically sends MLD general queries to all hosts and devices on the local subnet to check for the existence of IPv6 multicast group members.

After receiving an MLD general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the router port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

MLD report

A host sends an MLD report to the MLD querier for the following purposes:

- Responds to queries if the host is an IPv6 multicast group member.
- Applies for an IPv6 multicast group membership.

After receiving an MLD report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the IPv6 address of the reported IPv6 multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry for the group with the receiving port an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the port as a dynamic member port to the forwarding entry and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an MLD report through a non-router port because of the host MLD report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their MLD reports upon receiving MLD reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port.

Done message

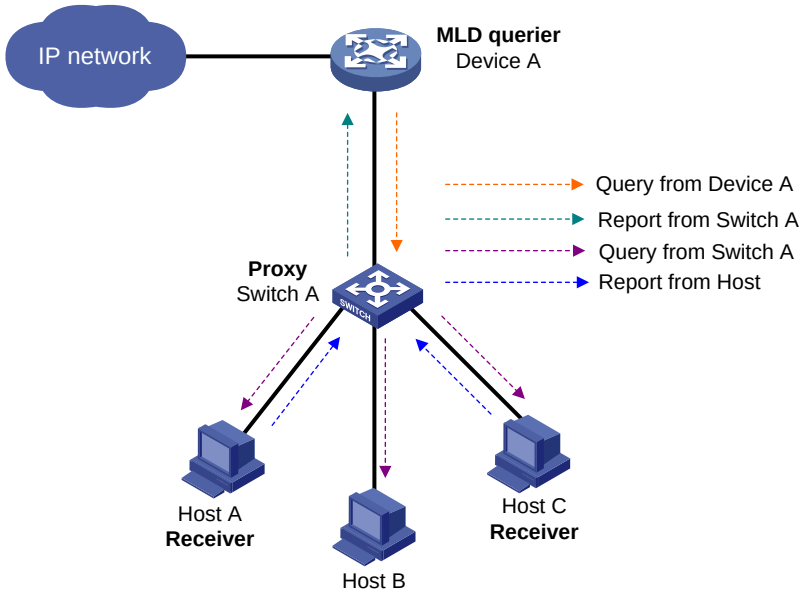
When a host leaves an IPv6 multicast group, the host sends an MLD done message to the Layer 3 devices. When the Layer 2 device receives the MLD done message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the IPv6 multicast group address in the message.

- If no match is found, the Layer 2 device discards the MLD done message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the MLD done message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the MLD done message.

- Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
- Sets the aging timer for the receiving port to twice the MLD last listener query interval.

- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the MLD done message to all router ports in the VLAN.
  - Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the MLD last listener query interval.

After receiving the MLD done message on a port, the MLD querier resolves the IPv6 multicast group address in the message. Then, it sends an MLD multicast-address-specific query to the IPv6 multicast group through the receiving port.



After receiving the MLD multicast-address-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding MLD report from the directly connected hosts. For the dynamic member port that received the done message, the Layer 2 device also performs one of the following actions:

- If the port receives an MLD report before the aging timer expires, the Layer 2 device resets the aging timer for the port.
- If the port does not receive any MLD report messages when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the IPv6 multicast group.

MLD snooping proxying

As shown in Figure 3, to reduce the number of MLD report and done messages received by the upstream device, you can enable MLD snooping proxying on the edge device. With MLD snooping proxying enabled, the edge device acts as a host for the upstream MLD snooping querier to send MLD report and done messages to Device A. The host MLD report suppression mechanism on the edge device does not take effect. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Figure 3 MLD snooping proxying

The MLD snooping proxy device processes different MLD messages as follows:

- General query.

After receiving an MLD general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an MLD report based on the local membership information and sends the report to all router ports.

- Multicast-address-specific query or multicast-address-and-source-specific query.

  After receiving an MLD multicast-address-specific query or multicast-address-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a response to all router ports in the VLAN.

- Report.

  After receiving an MLD report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Done message.

  After receiving the MLD done message on a port, the device sends an MLD multicast-address-specific query through the receiving port. The device sends the MLD done message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: MLD snooping configuration

For MLD reports received from secondary VLANs, the relevant MLD snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable MLD snooping only for the primary VLAN. The configuration made in secondary VLANs will not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The MLD snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in MLD-snooping view. The VLAN-specific configuration and the configuration made in MLD-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in MLD-snooping view. The interface-specific configuration takes priority over the configuration made in MLD-snooping view.

VLAN-based MLD snooping tasks at a glance

To configure MLD snooping for VLANs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:
   - Enabling MLD snooping globally
   - Enabling MLD snooping for VLANs
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Configuring static IPv6 multicast MAC address entries
   - Setting the MLD last listener query interval
4. (Optional.) Configuring MLD snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
   - Enabling the device to send MLD general queries upon a path change
   - Enabling the device to send MLD general queries upon a port state change
6. (Optional.) Enabling MLD snooping proxying
7. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
8. (Optional.) Configuring MLD snooping policies
   - Configuring an IPv6 multicast group policy
   - Enabling IPv6 multicast source port filtering
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
   - Setting the maximum number of IPv6 multicast groups on a port
   - Enabling IPv6 multicast group replacement
   - Enabling host tracking
   - Configuring an MLD snooping access control policy
9. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
10. (Optional.) Enabling SNMP notifications for MLD snooping
11. (Optional.) Configuring MLD snooping logging

- Enabling MLD snooping logging
- Enabling MLD snooping logging suppression

Enabling the MLD snooping feature

About this task

You must enable the MLD snooping feature before you configure other MLD snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the MLD snooping feature and enter MLD-snooping view.
   `mld-snooping`
   By default, the MLD snooping feature is disabled.

Enabling MLD snooping

Enabling MLD snooping globally

About this task

After you enable MLD snooping globally, MLD snooping is enabled for all VLANs. You can disable MLD snooping for a VLAN when MLD snooping is globally enabled.

Restrictions and guidelines

To configure other MLD snooping features for VLANs, you must enable MLD snooping for the specific VLANs even though MLD snooping is enabled globally.

The VLAN-specific MLD snooping configuration takes priority over the global MLD snooping configuration. For example, if you enable MLD snooping globally and then use the **`mld-snooping disable`** command to disable MLD snooping for a VLAN, MLD snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter MLD-snooping view.
   `mld-snooping`
3. Enable MLD snooping globally.
   `global-enable`
   By default, MLD snooping is disabled globally.
4. (Optional.) Disable MLD snooping for a VLAN.
   a. Return to system view.
      `quit`
   b. Enter VLAN view.
      `vlan` *`vlan-id`*
   c. Disable MLD snooping for the VLAN.
      `mld-snooping disable`

By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for VLANs

Restrictions and guidelines

You can enable MLD snooping for multiple VLANs by using the **enable vlan** command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view.

MLD snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling MLD snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping for multiple VLANs.
   enable vlan *vlan-list*
   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping for the VLAN.
   mld-snooping enable
   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Configuring basic MLD snooping features

Specifying an MLD snooping version

About this task

Different MLD snooping versions can process different versions of MLD messages:

- MLDv1 snooping can process MLDv1 messages and MLDv2 queries, but it floods MLDv2 reports in the VLAN instead of processing them.
- MLDv2 snooping can process MLDv1 and MLDv2 messages.

Restrictions and guidelines

If you change the version of MLD snooping from 2 to 1, the system performs the following actions:

- Clears all MLD snooping forwarding entries that are dynamically created.
- Keeps static MLDv2 snooping forwarding entries (*, G).
- Clears static MLDv2 snooping forwarding entries (S, G), which will be restored when MLD snooping is switched back to MLDv2 snooping.

For more information about static MLD snooping forwarding entries, see "Configuring a static member port."

Specifying an MLD snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Specify an MLD snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an MLD snooping version for the VLAN.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VLAN is 1.

Setting the maximum number of MLD snooping forwarding entries

About this task

You can modify the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum number of MLD snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of MLD snooping forwarding entries is 4294967295.

Configuring static IPv6 multicast MAC address entries

About this task

In Layer 2 IPv6 multicast, IPv6 multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as MLD snooping). You can also manually configure static IPv6 multicast MAC address entries by binding IPv6 multicast MAC addresses and ports to control the destination ports of the IPv6 multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static IPv6 multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static IPv6 multicast MAC address entry in system view

1. Enter system view.

   system-view
2. Configure a static IPv6 multicast MAC address entry.

   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static IPv6 multicast MAC address entry in interface view

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure a static IPv6 multicast MAC address entry.

   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the MLD last listener query interval

About this task

A receiver host starts a report delay timer for an IPv6 multicast group when it receives an MLD multicast-address-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the group.

The MLD last listener query interval defines the maximum response time advertised in MLD multicast-address-specific queries. Set an appropriate value for the MLD last listener query interval to speed up hosts' responses to MLD multicast-address-specific queries and avoid MLD report traffic bursts.

Setting the MLD last listener query interval globally

1. Enter system view.

   system-view
2. Enter MLD-snooping view.

   mld-snooping
3. Set the MLD last listener query interval globally.

   last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.

Setting the MLD last listener query interval for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

vlan *vlan-id*

3. Set the MLD last listener query interval for the VLAN
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VLAN.

Configuring MLD snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an MLD general query or IPv6 PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an MLD report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports based on the actual network requirement. For example, if the memberships of IPv6 multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports.

If a dynamic router port receives an IPv6 PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **mld-snooping router-aging-time** command does not take effect on the port.

MLD multicast-address-specific queries originated by the Layer 2 device trigger the adjustment of aging timers of dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the MLD last listener query interval. For more information about setting the MLD last listener query interval on the Layer 2 device, see "Setting the MLD last listener query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   mld-snooping router-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic router ports.

4. Set the aging timer for dynamic member ports in the VLAN.

   mld-snooping host-aging-time *seconds*

   By default, a VLAN uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for an IPv6 multicast group so that all hosts attached to the port can always receive IPv6 multicast data for the group. The static member port does not respond to MLD queries. When you complete or cancel this configuration, the port does not send an unsolicited report or done message.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.

   mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for an IPv6 multicast group so that all IPv6 multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.

   mld-snooping static-router-port vlan *vlan-id*

   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited MLD report when you complete the configuration.
- It responds to MLD general queries with MLD reports.
- It sends an MLD done message when you remove the configuration.

The version of MLD running on the simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same ways as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*
   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message. The device no longer sends or forwards MLD multicast-address-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts attached in a VLAN. If you do so, the remaining receivers cannot receive IPv6 multicast data for a group after a receiver leaves the group.

As a best practice to avoid multicast service interruption on other ports in the same VLAN, enable only MLD snooping fast-leave processing on a port on a network configured with both MLD snooping and MLD. Do not use the **mld fast-leave** command to enable MLD fast-leaving processing.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   mld-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send MLD general queries or IPv6 PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All IPv6 multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive IPv6 multicast data that it does not expect.
- The port forwards the MLD general queries or IPv6 PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the MLD querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable the port from becoming a dynamic router port when receiving an MLD general queries or IPv6 PIM hello message. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   mld-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an MLD snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable MLD snooping in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   mld-snooping router-port-discard
   By default, the device forwards multicast data to static router ports in a VLAN.

Configuring the MLD snooping querier

Enabling the MLD snooping querier

About this task

This feature enables the Layer 2 device to periodically send MLD general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an MLD snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the MLD snooping querier on an IPv6 multicast network that runs MLD. An MLD snooping querier does not participate in MLD querier elections. However, it might affect MLD querier elections if it sends MLD general queries with a low source IPv6 address.

Enabling the MLD snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the MLD snooping querier for the VLAN.
   mld-snooping querier
   By default, the MLD snooping querier is disabled for a VLAN.

Enabling MLD snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for MLD snooping querier election is the same as that for MLD querier election. For more information about MLD querier election, see "Configuring MLD."

Prerequisites

Before you enable MLD snooping querier election, you must complete the following tasks:

- Enable the MLD snooping querier for a VLAN. For more information about enabling the MLD snooping querier, see "Enabling the MLD snooping querier."
- Configure the source IPv6 address for MLD general queries as an IPv6 address different from :: and the local querier IPv6 address. An MLD snooping querier performs querier election only if the source IPv6 address of a received MLD general query is not :: or its own IPv6 address.
- Make sure the candidate MLD snooping queriers run the same MLD snooping version. To specify the MLD snooping version, use the **mld-snooping version** command.

Enabling MLD snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping querier election for the VLAN.
   mld-snooping querier-election
   By default, MLD snooping querier election is disabled for a VLAN.

Configuring parameters for MLD general queries and responses

About this task

You can modify the MLD general query interval based on the actual network conditions.

A receiver host starts a report delay timer for each IPv6 multicast group that it has joined when it receives an MLD general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the corresponding IPv6 multicast group.

Set an appropriate value for the maximum response time for MLD general queries to speed up hosts' responses to MLD general queries and avoid MLD report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting IPv6 multicast group members, make sure the MLD general query interval is greater than the maximum response time for MLD general queries.

Configuring parameters for MLD general queries and responses globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping

3. Set the maximum response time for MLD general queries.
   max-response-time *seconds*
   By default, the maximum response time for MLD general queries is 10 seconds.

Configuring parameters for MLD general queries and responses for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD general query interval in the VLAN.
   mld-snooping query-interval *interval*
   By default, the MLD general query interval for a VLAN is 125 seconds.
4. Set the maximum response time for MLD general queries in the VLAN.
   mld-snooping max-response-time *seconds*
   By default, the maximum response time for MLD general queries for a VLAN is 10 seconds.

Enabling the device to send MLD general queries upon a path change

About this task

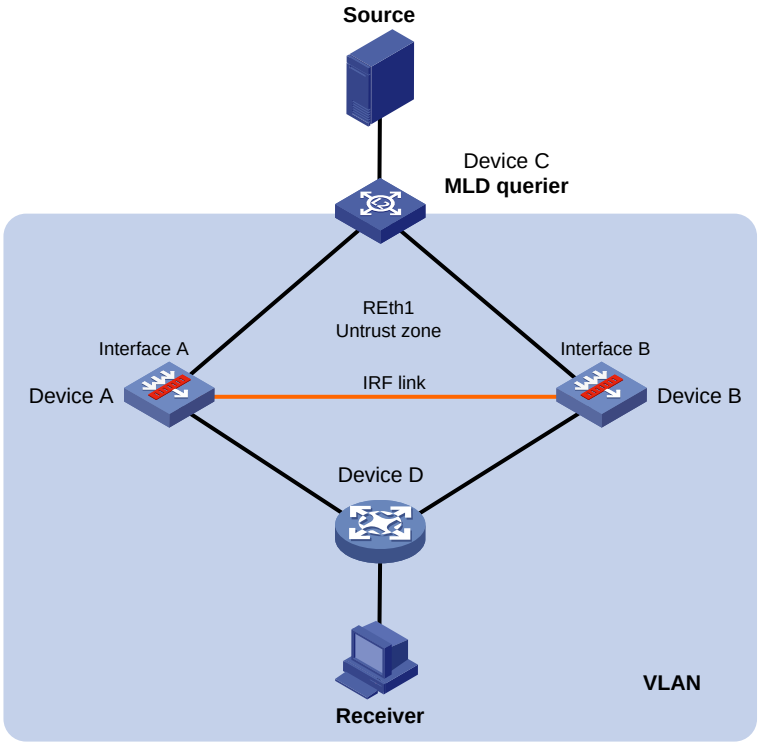
Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the path changes. This feature ensures that the device can update the member port information in IPv6 multicast forwarding entries and switch IPv6 multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the MLD snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable the device to send MLD general queries upon a path change.
   send-query enable
   By default, the device does not send MLD general queries upon a path change.



Enabling the device to send MLD general queries upon a port state change

About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an MLD general query immediately and cannot update interface B to multicast forwarding entries. For information about Reth interfaces, see *High Availability Configuration Guide*.

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send MLD general queries upon a port state change.
   mld-snooping triggered-query enable { **port-down** | **port-up** } *
   By default, the device does not send MLD general queries upon a port state change.

Enabling MLD snooping proxying

About MLD snooping proxying

The device enabled with MLD snooping proxying is called an MLD snooping proxy. The MLD snooping proxy acts as a host to the upstream device. Enabled with MLD snooping querier, the MLD snooping proxy acts as the router to downstream devices and receives report and done messages on behalf of the upstream device. As a best practice, enable MLD snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling MLD snooping proxying

Before you enable MLD snooping proxying for a VLAN, you must first enable MLD snooping globally and enable MLD snooping for the VLAN. MLD snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with MLD snooping querier. For more information about enabling MLD snooping querier, see "Enabling the MLD snooping querier."

Enabling MLD snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping proxying for the VLAN.
   mld-snooping proxy enable
   By default, MLD snooping proxying is disabled for a VLAN.

Configuring parameters for MLD messages

Configuring source IPv6 addresses for MLD messages

About this task

You can change the source IPv6 address of the MLD queries sent by an MLD snooping querier. This configuration might affect MLD querier election within the subnet.

You can also change the source IPv6 address of MLD reports or done messages sent by a simulated member host or an MLD snooping proxy.

Configuring the source IPv6 addresses for MLD messages for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Configure the source IPv6 address for MLD general queries.
   mld-snooping general-query source-ip *ipv6-address*
   By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.
4. Configure the source IPv6 address for MLD multicast-address-specific queries.
   mld-snooping special-query source-ip *ipv6-address*
   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:
   - The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.

- The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
- FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.

5. Configure the source IPv6 address for MLD reports.

   mld-snooping report source-ip *ipv6-address*

   By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Setting the 802.1p priority for MLD messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards MLD messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to MLD messages that are created or forwarded by the device.

Setting the 802.1p priority for MLD messages globally

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Set the 802.1p priority for MLD messages globally.

   dot1p-priority *priority*

   By default, the global 802.1p priority is not set for MLD messages.

Setting the 802.1p priority for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the 802.1p priority for MLD messages in the VLAN.

   mld-snooping dot1p-priority *priority*

   By default, the 802.1p priority is not set for MLD messages.

Configuring MLD snooping policies

Configuring an IPv6 multicast group policy

About this task

This feature enables the Layer 2 device to filter MLD reports by using an ACL that specifies the IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that

receiver hosts can join. This configuration takes effect on the IPv6 multicast groups that ports join dynamically.

In an IPv6 multicast application, a host sends an unsolicited MLD report when a user requests an IPv6 multicast program. The Layer 2 device uses the IPv6 multicast group policy to filter the MLD report. The host can join the IPv6 multicast group only if the MLD report is permitted by the IPv6 multicast group policy.

Configuring an IPv6 multicast group policy globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Configure an IPv6 multicast group policy globally.
   group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Configuring an IPv6 multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure an IPv6 multicast group policy on the port.
   mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist on a port. Hosts attached to the port can join any IPv6 multicast groups.

Enabling IPv6 multicast source port filtering

About this task

This feature enables the Layer 2 device to discard all IPv6 multicast data packets and to accept IPv6 multicast protocol packets. You can enable this feature on ports that connect to only IPv6 multicast receivers.

The configuration made in MLD-snooping view has the same priority over the interface-specific configuration.

Restrictions and guidelines

The configuration made in MLD-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling IPv6 multicast source port filtering in MLD-snooping view

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast source port filtering globally.

source-deny port *interface-list*

By default, IPv6 multicast source port filtering is disabled globally.

Enabling IPv6 multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable IPv6 multicast source port filtering on the port.
   mld-snooping source-deny

   By default, IPv6 multicast source port filtering is disabled on a port.

Enabling dropping unknown IPv6 multicast data

About this task

Unknown IPv6 multicast data refers to IPv6 multicast data for which no forwarding entries exist in the MLD snooping forwarding table. This feature enables the device to forward unknown IPv6 multicast data only to the router port. If the device does not have a router port, unknown IPv6 multicast data will be dropped.

If you do not enable this feature, the unknown IPv6 multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv6 multicast data is enabled, the device also drops unknown IPv4 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown IPv6 multicast data out of router ports (except the receiving router port) in this VLAN.

If the outgoing ports of the IPv6 multicast forwarding entry for a Layer 3 IPv6 multicast packet are in the same VLAN, enable dropping unknown IPv6 multicast data for the VLAN as a best practice. This restriction prevents the device from flooding the Layer 3 IPv6 multicast packet in the VLAN.

Enabling dropping unknown IPv6 multicast data globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable dropping unknown IPv6 multicast data globally.
   drop-unknown

   By default, this feature is disabled, and unknown IPv6 multicast data is flooded.

Enabling dropping unknown IPv6 multicast data for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable dropping unknown IPv6 multicast data for the VLAN.
   mld-snooping drop-unknown

By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling MLD report suppression

About this task

This feature enables the Layer 2 device to forward only the first MLD report for an IPv6 multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce the multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD report suppression.
   report-aggregation
   By default, MLD report suppression is enabled.

Setting the maximum number of IPv6 multicast groups on a port

About this task

You can set the maximum number of IPv6 multicast groups on a port to regulate the port traffic. This feature takes effect only on the IPv6 multicast groups that the port joins dynamically.

If the number of IPv6 multicast groups on a port exceeds the limit, the system removes all the forwarding entries related to that port. In this case, the receiver hosts attached to that port can join IPv6 multicast groups again before the number of IPv6 multicast groups on the port reaches the limit. When the number of IPv6 multicast groups on the port reaches the limit, the port automatically drops MLD reports for new IPv6 multicast groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of IPv6 multicast groups on the port.
   mld-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of IPv6 multicast groups on a port.

Enabling IPv6 multicast group replacement

About this task

When IPv6 multicast group replacement is enabled, the port does not drop MLD reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves an IPv6 multicast group that has the lowest IPv6 address and joins the new group contained in the MLD report. The IPv6 multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that the port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the MLD snooping forwarding entries on the device reaches the upper limit.
- The IPv6 multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling IPv6 multicast group replacement globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled globally.

Enabling IPv6 multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable IPv6 multicast group replacement on the port.
   mld-snooping overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving IPv6 multicast data. The information includes IPv6 addresses of the hosts, length of time elapsed since the hosts joined IPv6 multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view

2. Enter MLD-snooping view.
   mld-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   mld-snooping host-tracking
   By default, host tracking is disabled in a VLAN.

Configuring an MLD snooping access control policy

About this task

This feature enables the device to use ACLs to filter MLD reports and done messages from IPv6 multicast users. IPv6 multicast users can join or leave only IPv6 multicast groups permitted by the MLD snooping control policies.

Procedure

1. Enter system view.
   system-view
2. Enter user profile view.
   user-profile *profile-name*
   For more information about this command, see user profile commands in *Security Command Reference*.
3. Configure an MLD snooping access control policy.
   mld-snooping access-policy *ipv6-acl-number*
   By default, no MLD snooping access control policies are configured. IPv6 multicast users can join or leave any IPv6 multicast groups.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping

3. Set the DSCP value for outgoing MLD protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD snooping

About this task

To report critical MLD snooping events to an SNMP NMS, enable SNMP notifications for MLD snooping.

For MLD snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for MLD snooping.

   snmp-agent trap enable mld-snooping [**entry-refresh-failed**]

   By default, SNMP notifications are enabled for MLD snooping.

Configuring MLD snooping logging

Enabling MLD snooping logging

About this task

This feature enables the MLD snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable MLD snooping logging or use the **mld-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.

   system-view

2. Enter MLD snooping view.

   mld-snooping

3. Enable MLD snooping logging.

   mld-snooping log enable [**group**]

   By default, MLD snooping logging is enabled.

Enabling MLD snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the MLD snooping module to the information center.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Enable MLD snooping logging suppression.
   mld-snooping log suppress [**group**]
   By default, MLD snooping logging suppression is enabled.

Display and maintenance commands for MLD snooping

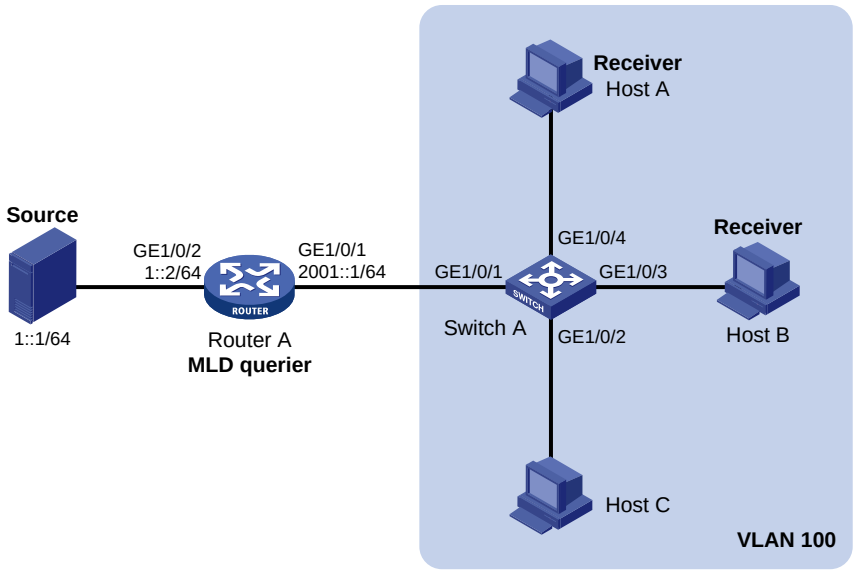
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display Layer 2 IPv6 multicast fast forwarding entries.	**display ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IPv6 multicast groups.	**display ipv6 l2-multicast ip** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 multicast group entries.	**display ipv6 l2-multicast ip forwarding** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 IPv6 MAC multicast groups.	**display ipv6 l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 MAC multicast group entries.	**display ipv6 l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static IPv6 multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Display MLD snooping status.	**display mld-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic MLD snooping group entries.	**display mld-snooping group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]

Task	Command
Display host tracking information.	**display mld-snooping host-tracking vlan** *vlan-id* **group** *ipv6-group-address* [**source** *ipv6-source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display mld-snooping router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static MLD snooping group entries.	**display mld-snooping static-group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display mld-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**display mld-snooping statistics**
Clear Layer 2 IPv6 multicast fast forwarding entries.	**reset ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear dynamic MLD snooping group entries.	**reset mld-snooping group** { *ipv6-group-address* [*ipv6-source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset mld-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**reset mld-snooping statistics**

MLD snooping configuration examples

Example: Configuring VLAN-based IPv6 group policy and simulated joining



Network configuration

As shown in Figure 5, Router A runs MLDv1 and acts as the MLD querier, and Switch A runs MLDv1 snooping.

Configure the group policy and simulate joining to meet the following requirements:

- Host A and Host B receive only the IPv6 multicast data addressed to the IPv6 multicast group FF1E::101. IPv6 multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown IPv6 multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping, and enable dropping IPv6 unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   [SwitchA-vlan100] quit
   ```

Configure an IPv6 multicast group policy so that hosts in VLAN 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] mld-snooping
[SwitchA–mld-snooping] group-policy 2001 vlan 100
[SwitchA–mld-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts to join IPv6 multicast group FF1E::101.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast groups FF1E::101 and FF1E::202. (Details not shown.)

Display dynamic MLD snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

The output shows the following information:

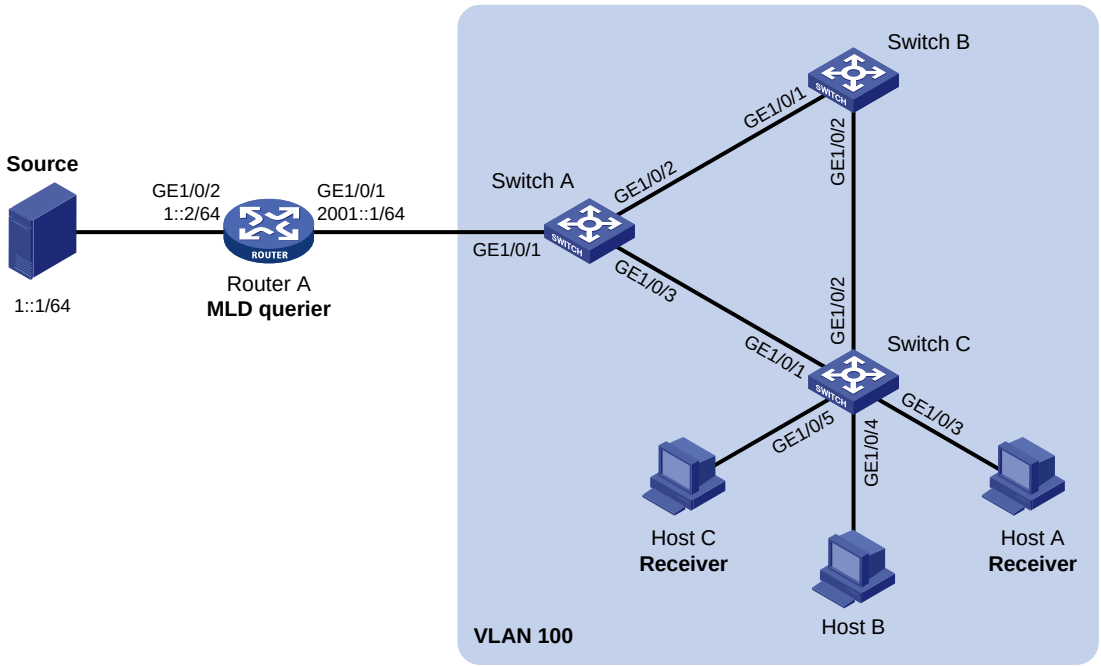
- Host A and Host B have joined IPv6 multicast group FF1E::101 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join the multicast group FF1E::202.

Example: Configuring VLAN-based static ports

Network configuration

As shown in Figure 6:

- Router A runs MLDv1 and acts as the MLD querier. Switch A, Switch B, and Switch C run MLDv1 snooping.
- Host A and Host C are permanent receivers of IPv6 multicast group FF1E::101.



Configure static ports to meet the following requirements:

- To enhance the reliability of IPv6 multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for IPv6 multicast group FF1E::101.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. IPv6 multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one MLD query-response cycle must be completed before IPv6 multicast data flows to the receivers

along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, IPv6 multicast data can flow to the receivers nearly uninterrupted along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 6.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable MLD snooping for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable MLD snooping for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for IPv6 multicast group FF1E::101.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
```

```
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

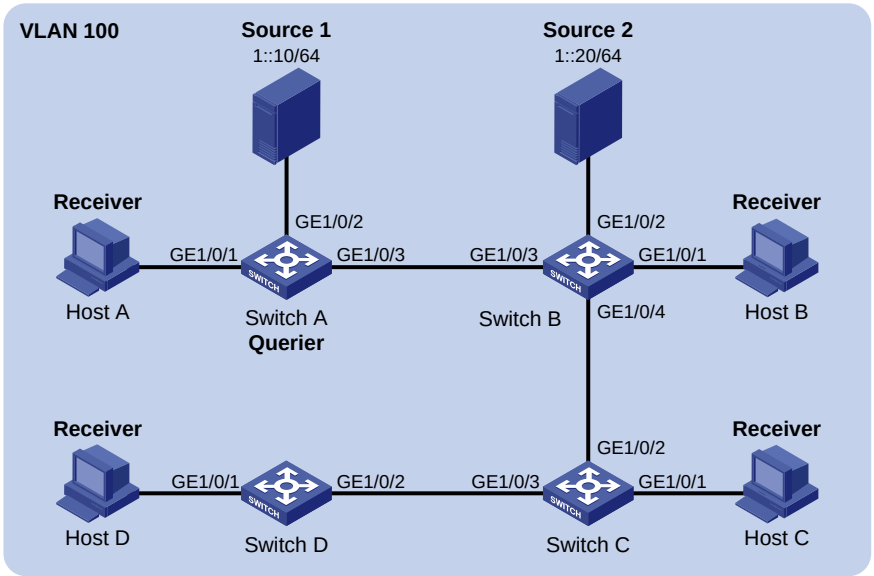
Display static MLD snooping group entries in VLAN 100 on Switch C.

```
[SwitchC] display mld-snooping static-group vlan 100
Total 1 entries).

VLAN 100: Total 1 entries).
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of IPv6 multicast group FF1E::101.

Example: Configuring the VLAN-based MLD snooping querier



Network configuration

As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to IPv6 multicast groups FF1E::101 and FF1E::102, respectively.
- Host A and Host C are receivers of IPv6 multicast group FF1E::101, and Host B and Host D are receivers of IPv6 multicast group FF1E::102.
- All host receivers run MLDv1 and all switches run MLDv1 snooping. Switch A (which is close to the multicast sources) acts as the MLD snooping querier.

To prevent the switches from flooding unknown IPv6 packets in the VLAN, enable all the switches to drop unknown IPv6 multicast packets.

Figure 7 Network diagram

Procedure

1. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   ```

   # Configure Switch A as the MLD snooping querier.

   ```
   [SwitchA-vlan100] MLD-snooping querier
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the MLD snooping feature.

   ```
   <SwitchB> system-view
   [SwitchB] mld-snooping
   [SwitchB-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchB] vlan 100
   [SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchB-vlan100] mld-snooping enable
   [SwitchB-vlan100] mld-snooping drop-unknown
   [SwitchB-vlan100] quit
   ```

3. Configure Switch C:

   # Enable the MLD snooping feature.

   ```
   <SwitchC> system-view
   [SwitchC] mld-snooping
   [SwitchC-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchC] vlan 100
   [SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchC-vlan100] mld-snooping enable
   [SwitchC-vlan100] mld-snooping drop-unknown
   [SwitchC-vlan100] quit
   ```

4. Configure Switch D:

   # Enable the MLD snooping feature.

   ```
   <SwitchD> system-view
   [SwitchD] mld-snooping
   [SwitchD-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

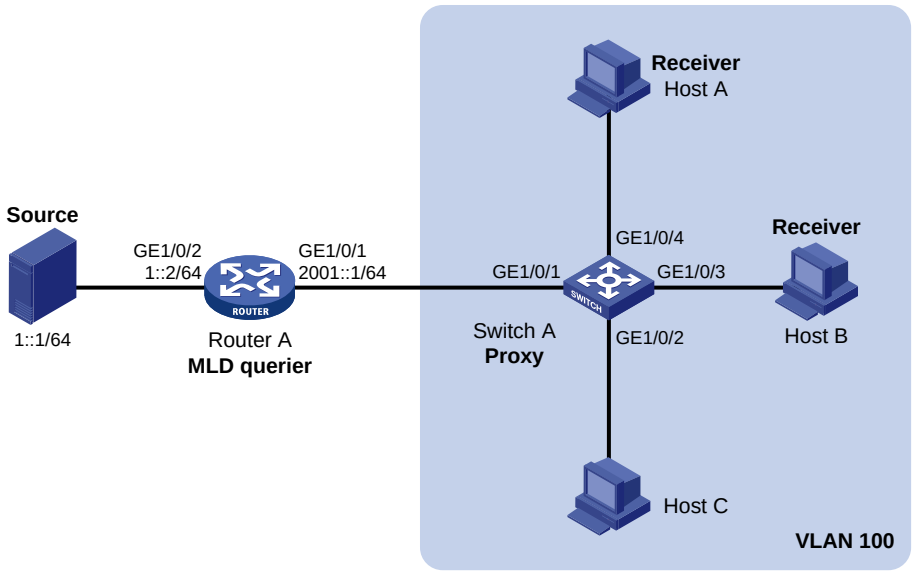
```
[SwitchD-vlan100] mld-snooping enable
[SwitchD-vlan100] mld-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping on Switch B.

```
[SwitchB] display mld-snooping statistics
Received MLD messages:
  MLD general queries: 19
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
  MLDv1 reports: 19
  MLDv2 reports: 0
  MLDv2 reports with right and wrong records: 0
  MLD dones: 5
  Error MLD messages: 1
Sent MLD messages:
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
Received IPv6 PIM hello: 0
```

The output shows that all switches except Switch A can receive the MLD general queries after Switch A acts as the MLD snooping querier.



Example: Configuring VLAN-based MLD snooping proxying

Network configuration

As shown in Figure 8, Router A runs MLDv1 and acts as the MLD querier. Switch A runs MLDv1 snooping. Configure MLD snooping proxying so that Switch A can perform the following actions:

- Forward MLD report and done messages to Router A.
- Respond to MLD queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

Prerequisites

Assign an IPv6 address and subnet mask to each interface, as shown in Figure 8.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD and IPv6 PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping and MLD snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping proxy enable
   ```

```
[SwitchA-vlan100] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:09)
      GE1/0/4                                  (00:03:06)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of IPv6 multicast group FF1E::101. Host A and Host B will receive IPv6 multicast data for the group.

Display MLD group membership information on Router A.

```
[RouterA] display mld group
MLD groups in total: 1
 GigabitEthernet1/0/1(2001::1):
  MLD groups reported in total: 1
   Group address: FF1E::101
    Last reporter: FE80::2FF:FFFF:FE00:1
    Uptime: 00:00:31
    Expires: 00:03:48
```

Send an MLD done message from Host A to leave IPv6 multicast group FF1E::101. (Details not shown.)

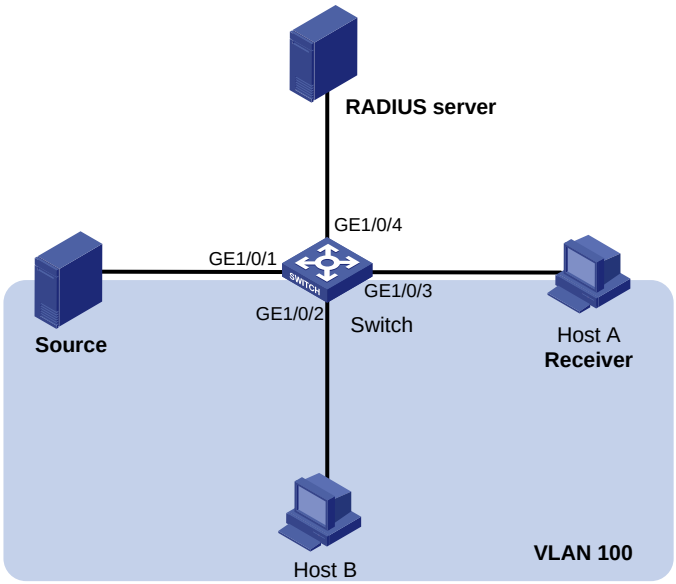
Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101. Only Host B will receive IPv6 multicast data for the group.

Example: Configuring a VLAN-based MLD snooping access policy



Network configuration

As shown in Figure 9:

- The switch runs MLD snooping.
- The switch performs 802.1X authentication for Host A and Host B.

Configure an MLD snooping access group policy on the switch so that Host A can join or leave only IPv6 multicast group FF1E::101.

Figure 9 Network diagram

Configuring the switch

1. Configure MLD snooping.

   # Enable the MLD snooping feature.

   ```
   <Switch> system-view
   [Switch] mld-snooping
   [Switch-mld-snooping] quit
   ```

   # Create VLAN 100 and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [Switch] vlan 100
   [Switch-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping for VLAN 100.

   ```
   [Switch-vlan100] mld-snooping enable
   [Switch-vlan100] quit
   ```

   # Configure an MLD snooping access policy.

   ```
   [Switch] acl ipv6 basic 2001
   [Switch-acl-ipv6-basic-2001] rule permit source FF1E::101 128
   [Switch-acl-ipv6-basic-2001] quit
   [Switch] user-profile profile2
   [Switch-user-profile-profile2] mld-snooping access-policy 2001
   [Switch-user-profile-profile2] quit
   ```

2. Configure a RADIUS scheme.

   # Create a RADIUS scheme named **scheme2**.

   ```
   [Switch] radius scheme scheme2
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-scheme2] primary authentication ipv6 3::1
   [Switch-radius-scheme2] key authentication simple 321123
   [Switch-radius-scheme2] primary accounting ipv6 3::1
   [Switch-radius-scheme2] key accounting simple 321123
   ```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-scheme2] user-name-format without-domain
[SwitchB-radius-scheme2] quit
```

3. Configure an authentication domain.

Create an ISP domain named **domain2**.

```
[Switch] domain domain2
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-domian2] authorization-attribute user-profile profile2
[Switch-isp-domian2] authentication lan-access radius-scheme scheme2
[Switch-isp-domian2] authorization lan-access radius-scheme scheme2
[Switch-isp-domian2] accounting lan-access radius-scheme scheme2
[Switch-isp-domian2] quit
```

Configure domain **domain2** as the default ISP domain.

```
[Switch] domain default enable domain2
```

4. Configure 802.1X authentication.

Enable 802.1X authentication on GigabitEthernet 1/0/2.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] dot1x
[Switch-GigabitEthernet1/0/2] quit
```

Enable 802.1X authentication on GigabitEthernet 1/0/3.

```
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] dot1x
[Switch-GigabitEthernet1/0/3] quit
```

Enable 802.1X authentication globally.

```
[Switch] dot1x
```

Configuring the RADIUS server

Configure the RADIUS server properly to provide authentication and accounting functions. (Details not shown.)

Verifying the configuration

Display dynamic MLD snooping group entries for VLAN 100.

```
[Switch] display mld-snooping group vlan 100
Total 1 entries.
VLAN 100: Total 1 entries.
  (0.0.0.0, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  (00:03:05)
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101.

Troubleshooting MLD snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function through MLD snooping.

Solution

To resolve the problem:

1. Use the **display mld-snooping** command to display MLD snooping status.
2. If MLD snooping is not enabled, use the **mld-snooping** command in system view to enable the MLD snooping feature. Then, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
3. If MLD snooping is enabled globally but not enabled for the VLAN, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
4. If the problem persists, contact H3C Support.

IPv6 multicast group policy does not work

Symptom

Hosts can receive IPv6 multicast data for IPv6 multicast groups that are not permitted by the IPv6 multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl ipv6** command to verify that the configured IPv6 ACL meets the IPv6 multicast group policy requirements.
2. Use the **display this** command in MLD-snooping view or in interface view to verify that the correct IPv6 multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **mld-snooping group-policy** command to apply the correct IPv6 multicast group policy.
3. Use the **display mld-snooping** command to verify that dropping unknown IPv6 multicast data is enabled. If it is not, use the **mld-snooping drop-unknown** command to enable dropping unknown IPv6 multicast data.
4. If the problem persists, contact H3C Support.

Configuring IPv6 PIM snooping

About IPv6 PIM snooping

IPv6 PIM snooping runs on Layer 2 devices. It works with MLD snooping to analyze received IPv6 PIM messages, and adds the ports that are interested in specific multicast data to an IPv6 PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with IPv6 PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the IPv6 PIM-capable routers are in the same VLAN.

- When the Layer 2 switch only runs MLD snooping, it performs the following actions:
  a. Maintains the router ports according to the received IPv6 PIM hello messages that IPv6 PIM-capable routers send.

b. Floods all other types of received IPv6 PIM messages except PIM hello messages in the VLAN.

c. Forwards all multicast data to all router ports in the VLAN.

Each IPv6 PIM-capable router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all IPv6 PIM messages except IPv6 PIM hello messages.

- When the Layer 2 switch runs both MLD snooping and IPv6 PIM snooping, it performs the following actions:

  a. Examines whether an IPv6 PIM router is interested in the multicast data destined for a multicast group according to the received IPv6 PIM messages that the router sends.

  b. Adds only the ports that connect to the router and are interested in the data to an IPv6 PIM snooping routing entry.

  c. Forwards IPv6 PIM messages and the multicast data only to the router according to the multicast forwarding entry, which saves network bandwidth.

For more information about MLD snooping and the router port, see "Configuring MLD snooping."

Restrictions and guidelines: IPv6 PIM snooping configuration

As a best practice, do not configure IPv6 PIM snooping for secondary VLANs because IPv6 PIM snooping does not take effect on secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of an IPv6 PIM join or prune message is smaller than the path MTU of devices connected to IPv6 PIM snooping devices. Otherwise, fragmented IPv6 PIM join or prune messages prevent IPv6 PIM snooping from correctly forwarding IPv6 multicast data.

IPv6 PIM snooping is supported only for IPv6 PIM-SM and IPv6 PIM-SSM. As a best practice, do not configure IPv6 PIM snooping in the IPv6 PIM-DM or IPv6 BIDIR-PIM network.

After you enable IPv6 PIM snooping for a VLAN, IPv6 PIM snooping takes effect only on ports that belong to the VLAN.

IPv6 PIM snooping tasks at a glance

To configure IPv6 PIM snooping, perform the following tasks:

1. Enabling IPv6 PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling IPv6 PIM snooping

1. Enter system view.

   `system-view`
2. Enable the MLD snooping feature and enter MLD -snooping view.

   `mld-snooping`

   By default, MLD snooping is disabled.

   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

quit

4. Enter VLAN view.
   vlan *vlan-id*
5. Enable MLD snooping for the VLAN.
   mld-snooping enable
   By default, MLD snooping is disabled in a VLAN.
   For more information about this command, see *IP Multicast Command Reference*.
6. Enable IPv6 PIM snooping for the VLAN.
   ipv6 pim-snooping enable
   By default, IPv6 PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 IPv6 multicast data interruption caused by the aging of IPv6 PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives an IPv6 PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives an IPv6 PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.
   system-view
1. Enter VLAN view.
   vlan *vlan-id*
2. Set the aging time for global neighbor ports after a master/subordinate switchover.
   pim-snooping graceful-restart neighbor-aging-time *seconds*
   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

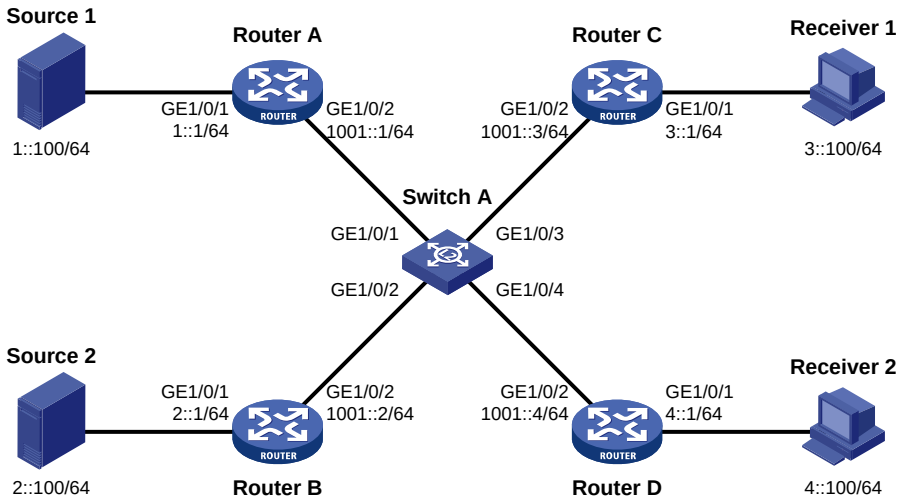
Display and maintenance commands for IPv6 PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PIM snooping neighbor information.	**display ipv6 pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping router port information.	**display ipv6 pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping routing entries.	**display ipv6 pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**display ipv6 pim-snooping statistics**
Clear statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**reset ipv6 pim-snooping statistics**

IPv6 PIM snooping configuration examples

Example: Configuring IPv6 PIM snooping



Network configuration

As shown in Figure 2:

- OSPFv3 runs on the network.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Receiver 1 and Receiver 2 belong to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Router C and Router D run MLD on GigabitEthernet 1/0/1.
- Router A, Router B, Router C, and Router D run IPv6 PIM-SM. GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure MLD snooping and IPv6 PIM snooping on Switch A. Then, Switch A forwards IPv6 PIM protocol packets and IPv6 multicast data packets only to routers that are connected to receivers.

Figure 2 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 2, and then configure OSPFv3 on the routers.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] ipv6 pim
   [RouterA-pim6] c-bsr 1001::1
   [RouterA-pim6] c-rp 1001::1
   [RouterA-pim6] quit
   ```

2. Configure Router B:

   # Enable IPv6 multicast routing.

   ```
   <RouterB> system-view
   [RouterB] ipv6 multicast routing
   [RouterB-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterB] interface gigabitethernet 1/0/1
   [RouterB-GigabitEthernet1/0/1] ipv6 pim sm
   [RouterB-GigabitEthernet1/0/1] quit
   [RouterB] interface gigabitethernet 1/0/2
   ```

```
[RouterB-GigabitEthernet1/0/2] ipv6 pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IPv6 multicast routing.

```
<RouterC> system-view
[RouterC] ipv6 multicast routing
[RouterC-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] mld enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] ipv6 pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IPv6 multicast routing.

```
<RouterD> system-view
[RouterD] ipv6 multicast routing
[RouterD-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] mld enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] ipv6 pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and IPv6 PIM snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] ipv6 pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display IPv6 PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
```

```
  FE80::1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  FE80::2
   Ports (1 in total):
      GE1/0/2                 (00:32:43)
  FE80::3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  FE80::4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are IPv6 PIM snooping neighbors.

On Switch A, display IPv6 PIM snooping routing entries for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping routing-table vlan 100
Total 2 entries.
FSM flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, FF1E::101)
    Upstream neighbor: FE80::1
      Upstream ports (1 in total):
        GE1/0/1
      Downstream ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, FF2E::101)
    Upstream neighbor: FE80::2
      Upstream ports (1 in total):
        GE1/0/2
      Downstream ports (1 in total):
        GE1/0/4
          Expires: 00:03:01, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for IPv6 multicast group FF1E::101 to only Router C.
- Switch A will forward the multicast data intended for IPv6 multicast group FF2E::101 to only Router D.

Troubleshooting IPv6 PIM snooping

This section describes common IPv6 PIM snooping problems and how to troubleshoot them.

IPv6 PIM snooping does not work on a Layer 2 device

Symptom

IPv6 PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about MLD snooping and IPv6 PIM snooping.
2. If MLD snooping is not enabled, enable the MLD snooping feature, and then enable MLD snooping and IPv6 PIM snooping for the VLAN.
3. If IPv6 PIM snooping is not enabled, enable IPv6 PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Configuring IPv6 multicast VLANs

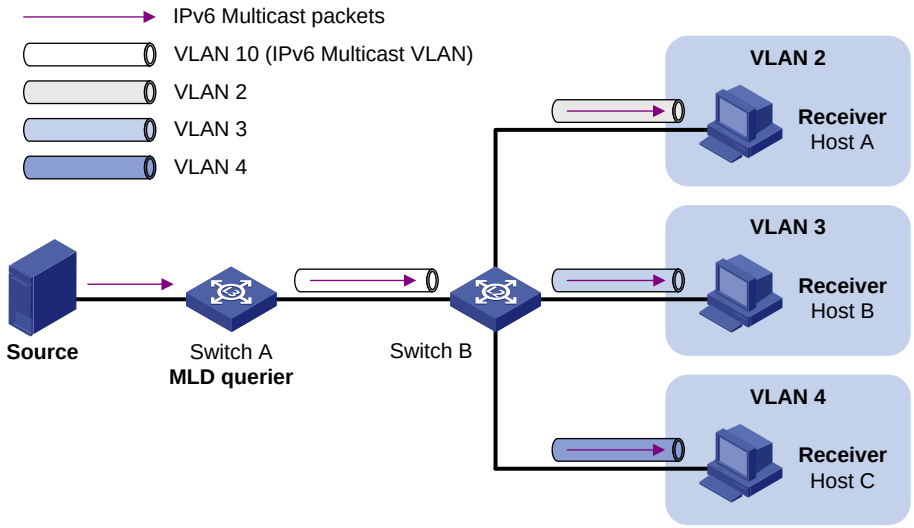
IPv6 multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in different VLANs and the same IPv6 multicast group. When Switch A (Layer 3 device) receives IPv6 multicast data for that group, it forwards three copies of the data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the IPv6 multicast VLAN feature

After an IPv6 multicast VLAN is configured on Switch B, Switch A sends one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. This saves network bandwidth and lessens the burden on the Layer 3 device.

IPv6 multicast VLAN methods



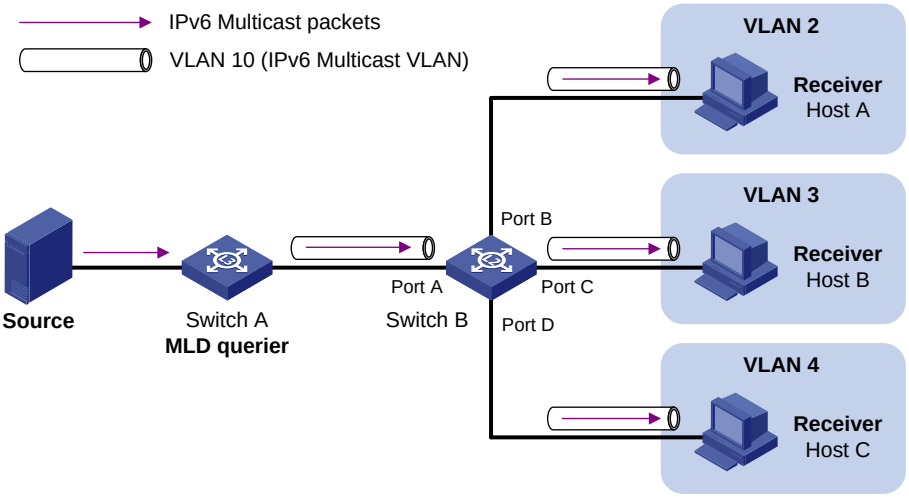
IPv6 multicast VLANs support sub-VLAN-based IPv6 multicast VLANs and port-based IPv6 multicast VLANs.

Sub-VLAN-based IPv6 multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- MLD snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



MLD snooping manages router ports in the IPv6 multicast VLAN and member ports in each sub-VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN of the IPv6 multicast VLAN.

Port-based IPv6 multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively. All the user ports (ports with attached hosts) on Switch B are hybrid ports.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. All the user ports are assigned to VLAN 10.
- MLD snooping is enabled for the IPv6 multicast VLAN and its sub-VLANs.

Figure 3 Port-based IPv6 multicast VLAN

MLD snooping manages the router ports and member ports in the IPv6 multicast VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each user port in the IPv6 multicast VLAN.

Restrictions and guidelines: IPv6 multicast VLAN configuration

The VLAN to be configured as an IPv6 multicast VLAN must exist.

If you have configured both a sub-VLAN-based IPv6 multicast VLAN and a port-based IPv6 multicast VLAN on a device, the port-based IPv6 multicast VLAN configuration takes effect.

Do not configure a VLAN as an IPv6 multicast VLAN or an IPv6 sub-VLAN if the VLAN interface is enabled with IPv6 PIM or MLD. Otherwise, the system displays errors. Do not enable IPv6 PIM or MLD on a VLAN interface if the VLAN interface belongs to an IPv6 multicast VLAN or an IPv6 multicast sub-VLAN. Otherwise, IPv6 multicast forwarding exceptions occur.

The IPv6 multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the IPv6 multicast VLAN feature for secondary VLANs. For more information about secondary VLAN, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based IPv6 multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN must exist and cannot be IPv6 multicast VLANs or sub-VLANs of any other IPv6 multicast VLANs.

Prerequisites

Before you configure a sub-VLAN-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN, and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.
   system-view
2. Configure a VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign VLANs to the IPv6 multicast VLAN as sub-VLANs.
   subvlan *vlan-list*
   By default, an IPv6 multicast VLAN does not have any sub-VLANs.

Configuring a port-based IPv6 multicast VLAN

Restrictions and guidelines

You can assign user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view or assign a user port to an IPv6 multicast VLAN in interface view.

A user port can belong to only one IPv6 multicast VLAN.

Prerequisites

Before you configure a port-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN.
- Enable MLD snooping for all the VLANs that contain the multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the IPv6 multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign ports to the IPv6 multicast VLAN as user ports.
   port *interface-list*

Assigning user ports to an IPv6 multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the IPv6 multicast VLAN as a user port.
   ipv6 port multicast-vlan *vlan-id*
   By default, a port does not belong to any IPv6 multicast VLAN.

Setting the maximum number of IPv6 multicast VLAN forwarding entries

About this task

You can set the maximum number of IPv6 multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create IPv6 multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.

system-view

2. Set the maximum number of IPv6 multicast VLAN forwarding entries.
   ipv6 multicast-vlan entry-limit *limit*
   By default, the maximum number of IPv6 multicast VLAN forwarding entries is 128.

Display and maintenance commands for IPv6 multicast VLANs

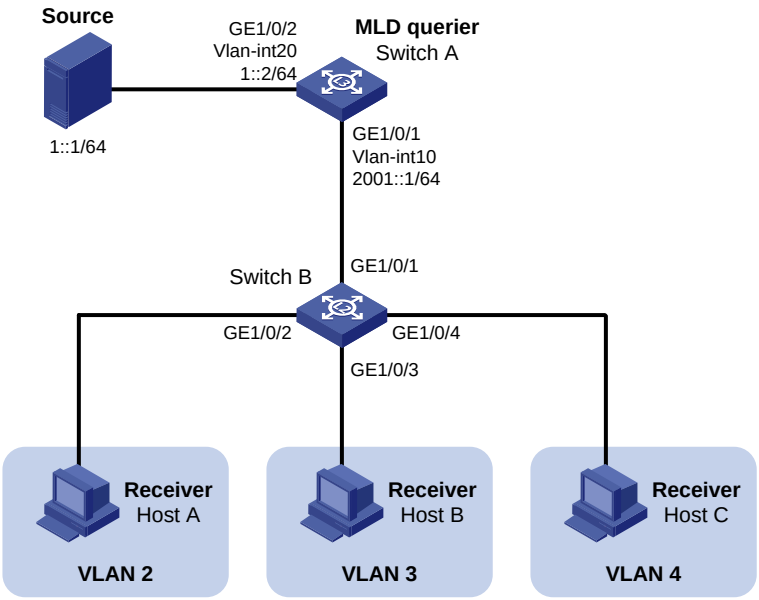
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IPv6 multicast VLANs.	**display ipv6 multicast-vlan** [*vlan-id*]
Display IPv6 multicast VLAN forwarding entries.	**display ipv6 multicast-vlan forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about information about IPv6 multicast group entries in IPv6 multicast VLANs.	**display ipv6 multicast-vlan group** [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear IPv6 multicast group entries in IPv6 multicast VLANs.	**reset ipv6 multicast-vlan group** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

IPv6 multicast VLAN configuration examples

Example: Configuring sub-VLAN-based IPv6 multicast VLAN

Network configuration



As shown in Figure 4:

- Layer 3 device Switch A runs MLD and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

Enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] ipv6 multicast-vlan 10
[SwitchB-ipv6-mvlan-10] subvlan 2 to 4
[SwitchB-ipv6-mvlan-10] quit
```

Verifying the configuration

Display information about all IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about IPv6 multicast groups in IPv6 multicast VLANs on Switch B.

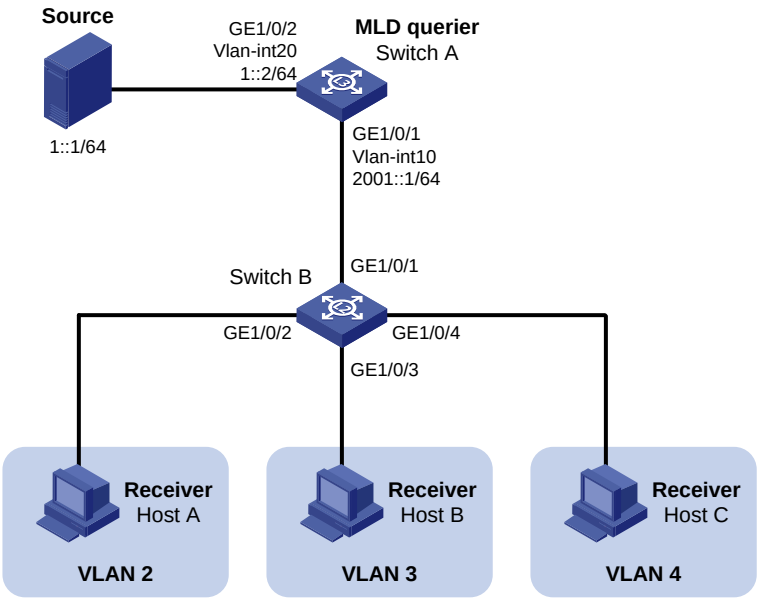
```
[SwitchB] display ipv6 multicast-vlan group
Total 1 entries.

IPv6 multicast VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that IPv6 multicast group FF1E::101 belongs to IPv6 multicast VLAN 10. IPv6 multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the IPv6 multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based IPv6 multicast VLAN

Network configuration



As shown in Figure 5:

- Layer 3 device Switch A runs MLDv1 and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN.

```
[SwitchB] ipv6 multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-ipv6-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-ipv6-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic MLD snooping forwarding entries on Switch B.

```
[SwitchB] display mld-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(::, FF1E::101)
  Host ports (3 in total):
    GE1/0/2         (00:03:23)
    GE1/0/3         (00:04:07)
    GE1/0/4         (00:04:16)
```

The output shows that MLD snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the IPv6 multicast data of VLAN 10 through these user ports.

Configuring IPv6 multicast routing and forwarding

About IPv6 multicast routing and forwarding

Each IPv6 multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the IPv6 multicast routing protocols are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general IPv6 multicast routing table. The optimal IPv6 multicast routing entries in the general IPv6 multicast routing table are added to the IPv6 multicast forwarding table to guide IPv6 multicast data forwarding.

RPF check mechanism

An IPv6 multicast routing protocol uses the reverse path forwarding (RPF) check mechanism to ensure IPv6 multicast data delivery along the correct path and to avoid data loops.

RPF check process

An IPv6 multicast device performs the RPF check on an IPv6 multicast packet as follows:

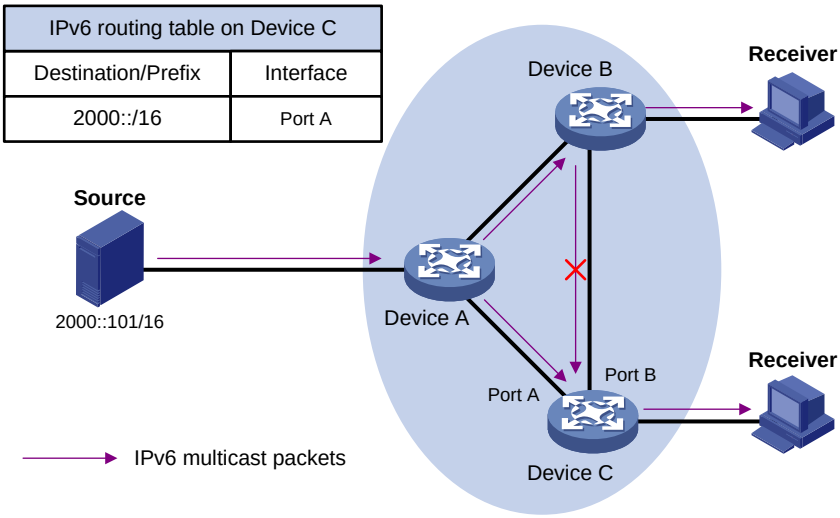
1. Chooses an optimal route back to the packet source from the IPv6 unicast as the RPF route.

   In RPF check, the "packet source" means difference things in difference situations:

   - For a packet that travels along the SPT, the packet source is the IPv6 multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "IPv6 PIM overview."

   In the RPF route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
2. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.
   - If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.



RPF check implementation in IPv6 multicast

Implementing an RPF check on each received IPv6 multicast packet would heavily burden the device. The use of an IPv6 multicast forwarding table is the solution to this issue. When the device creates an IPv6 multicast forwarding entry for an IPv6 (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up its IPv6 multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source. Then, it creates a forwarding entry with the RPF interface as the incoming interface and performs one of the following tasks:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all outgoing interfaces.

- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following tasks:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

Figure 1 RPF check process

As shown in Figure 1, assume that IPv6 unicast routes are available on the network. IPv6 multicast packets travel along the SPT from the multicast source to the receivers. The IPv6 multicast forwarding table on Device C contains the (S, G) entry, with Port A as the RPF interface.

- If an IPv6 multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.
- If an IPv6 multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its IPv6 unicast routing table and finds that the outgoing interface to the source (the RPF interface) is Port A. This means that the (S, G) entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and Device C discards the packet.

IPv6 mtrace

IPv6 mtrace uses mtrace2 to trace the path along which IPv6 multicast group data travels from a source to a destination.

Device roles

IPv6 mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has an IPv6 multicast-enabled interface on the same subnet as the destination and can forward specific IPv6 multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the IPv6 multicast source.
- **Client**—A client is a router that initiates an mtrace2.

Process

The IPv6 mtrace process is as follows:

3. The client sends an mtrace2 Query message (with a **hops** field indicating the maximum number of hops to be traced) to the destination.
4. The LHR turns the received Query message to an mtrace2 Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
5. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
6. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace2 Reply message and sends the Reply message to the client.
7. The client interprets forwarding information in the Reply message and displays the information.

Restrictions: Hardware compatibility with IPv6 multicast routing and forwarding

Only the S5136S-EI switch series supports IPv6 multicast routing and forwarding.

IPv6 multicast routing and forwarding tasks at a glance

To configure IPv6 multicast routing and forwarding, perform the following tasks:

8. Enabling IPv6 multicast routing
9. (Optional.) Configuring static IPv6 multicast routes
10. (Optional.) Specifying the longest prefix match principle
11. (Optional.) Configuring an IPv6 multicast forwarding boundary
12. (Optional.) Using mtrace2 to trace an IPv6 multicast path
13. (Optional.) Setting the maximum number of cached unknown IPv6 multicast packets
14. (Optional.) Setting the maximum number of copied IPv6 multicast packets during software forwarding

Prerequisites for IPv6 multicast routing and forwarding

Before you configure multicast routing and forwarding, configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IPv6 multicast routing

About this task

Enable IPv6 multicast routing before you configure any Layer 3 IPv6 multicast functionality in the public network or VPN instance.

Procedure

15. Enter system view.

system-view

16. Enable IPv6 multicast routing and enter IPv6 MRIB view.

    ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

    By default, IPv6 multicast routing is disabled.

Configuring static IPv6 multicast routes

About this task

When configuring a static IPv6 multicast route for an IPv6 multicast source, you can specify an RPF interface or an RPF neighbor for the IPv6 multicast traffic from that source.

Restrictions and guidelines

Static IPv6 multicast routes take effect only on the IPv6 multicast devices on which they are configured, and will not be broadcast or redistributed to other devices.

Procedure

17. Enter system view.

    system-view

18. Configure a static multicast route.

    ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*] *ipv6-source-address prefix-length* { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]

19. (Optional.) Delete all static IPv6 multicast routes.

    delete ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*]

    To delete a single static IPv6 multicast route, use the **undo ip rpf-route-static** command.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

20. Enter system view.

    system-view

21. Enter IPv6 MRIB view.

    ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

22. Specify the longest prefix match principle for RPF route selection.

    longest-match

    By default, the route preference principle is used.

Configuring an IPv6 multicast forwarding boundary

About this task

You can configure an interface as an IPv6 multicast forwarding boundary for an IPv6 multicast group range. The interface cannot receive or forward IPv6 multicast packets for the groups in the range.

Restrictions and guidelines

You do not need to enable IPv6 multicast routing before this configuration.

Procedure

23. Enter system view.

system-view

24. Enter interface view.

interface *interface-type interface-number*

25. Configure an IPv6 multicast forwarding boundary.

ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

By default, an interface is not an IPv6 multicast forwarding boundary for any IPv6 multicast groups.

Using mtrace2 to trace an IPv6 multicast path

Restrictions and guidelines

For successful IPv6 mtrace, do not use a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

26. Enter system view.

system-view

27. (Optional.) Specify the UDP port number used by IPv6 mtrace.

ipv6 mtrace-service port *number*

By default, IPv6 mtrace uses UDP port number 10240.

28. Use mtrace2 to trace an IPv6 multicast path.

mtrace v2 ipv6 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]

The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown IPv6 multicast packets

About this task

The device caches an IPv6 multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping IPv6 multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **ipv6 multicast forwarding-table cache-unknown total** command to be far greater than the value in the **ipv6 multicast forwarding-table cache-unknown per-entry** command.

Procedure

29. Enter system view.

    system-view

30. Set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry.

    ipv6 multicast forwarding-table cache-unknown per-entry *per-entry-limit*

    By default, the device can cache only one unknown IPv6 multicast packet for an (S, G) entry.

31. Set the maximum number of unknown IPv6 multicast packets that can be cached in total.

    ipv6 multicast forwarding-table cache-unknown total *total-limit*

    By default, the device can cache 1024 unknown IPv6 multicast packets in total.

Setting the maximum number of copied IPv6 multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause IPv6 multicast packets to be dropped.

CAUTION:

Perform this task under the guidance of H3C Support.

Procedure

32. Enter system view.

    system-view

33. Set the maximum number of copied IPv6 multicast packets during software forwarding.

    ipv6 multicast cpu-forwarding max-copy-count *count*

    The maximum number of copied IPv6 multicast packets during software forwarding is not set.

Display and maintenance commands for IPv6 multicast routing and forwarding

CAUTION:
The **reset** commands might cause IPv6 multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the IPv6 MRIB.	**display ipv6 mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display IPv6 multicast boundary information.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]
Display IPv6 multicast fast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display statistics for IPv6 multicast forwarding events.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display IPv6 multicast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *
Display IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*ipv6-source-address* [*prefix-length*]]
Display RPF information for an IPv6 multicast source.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]

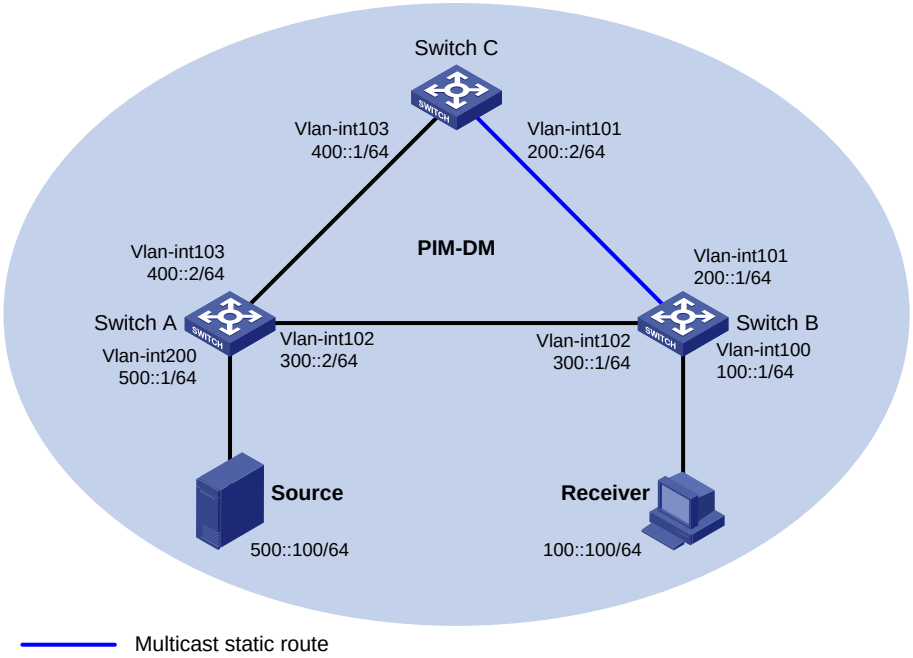
Task	Command
Clear IPv6 multicast fast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for IPv6 multicast forwarding events.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear IPv6 multicast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear IPv6 multicast routing entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.
- When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

IPv6 multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 2:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IPv6 multicast.
- Switch A, Switch B, and Switch C run OSPFv3.
- Typically, the receiver host can receive the IPv6 multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the IPv6 multicast data from the source travels to the receiver along the following path: Switch A to Switch C to Switch B. This path is different from the unicast route.

Figure 2 Network diagram

Prerequisites

34. Assign an IP address and prefix length for each interface, as shown in Figure 2.
35. Configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

36. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

    # On Switch B, enable IPv6 multicast routing.

    ```
    <SwitchB> system-view
    [SwitchB] ipv6 multicast routing
    [SwitchB-mrib6] quit
    ```

    # Enable MLD on the receiver-side interface VLAN-interface 100.

    ```
    [SwitchB] interface vlan-interface 100
    [SwitchB-Vlan-interface100] mld enable
    [SwitchB-Vlan-interface100] quit
    ```

    # Enable IPv6 PIM-DM on the other interfaces.

    ```
    [SwitchB] interface vlan-interface 101
    [SwitchB-Vlan-interface101] ipv6 pim dm
    [SwitchB-Vlan-interface101] quit
    [SwitchB] interface vlan-interface 102
    [SwitchB-Vlan-interface102] ipv6 pim dm
    [SwitchB-Vlan-interface102] quit
    ```

    # On Switch A, enable IPv6 multicast routing.

    ```
    <SwitchA> system-view
    [SwitchA] ipv6 multicast routing
    [SwitchA-mrib6] quit
    ```

    # Enable IPv6 PIM-DM on each interface.

    ```
    [SwitchA] interface vlan-interface 200
    ```

```
[SwitchA-Vlan-interface200] ipv6 pim dm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

37. Display RPF information for the source on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

38. On Switch B, configure a static IPv6 multicast route to the source and specify Switch C as the RPF neighbor.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for the source on Switch B.

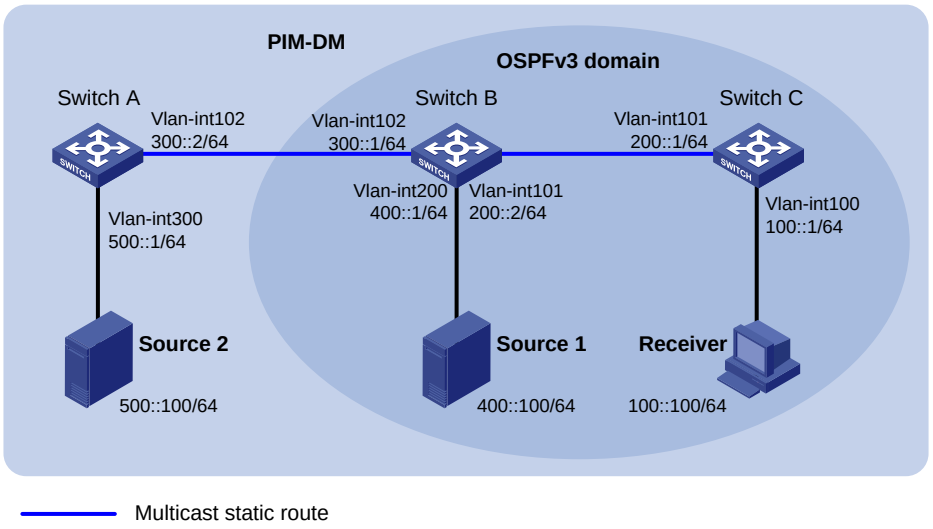
```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static IPv6 multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route

Network configuration



As shown in Figure 3:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IP multicast.

- Switch B and Switch C run OSPFv3, and have no unicast routes to Switch A.
- Typically, the receiver host receives the IPv6 multicast data from the source 1 in the OSPFv3 domain.

Configure the switches so that the receiver host can receive IPv6 multicast data from Source 2, which is outside the OSPFv3 domain.

Figure 3 Network diagram

Prerequisites

39. Assign an IP address and subnet mask for each interface, as shown in Figure 3.
40. Configure OSPFv3 on Switch B and Switch C.

Procedure

41. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

    # On Switch C, enable IPv6 multicast routing.

    ```
    <SwitchC> system-view
    [SwitchC] ipv6 multicast routing
    [SwitchC-mrib6] quit
    ```

    # Enable MLD on the receiver-side interface VLAN-interface 100.

    ```
    [SwitchC] interface vlan-interface 100
    [SwitchC-Vlan-interface100] mld enable
    [SwitchC-Vlan-interface100] quit
    ```

    # Enable IPv6 PIM-DM on VLAN-interface 101.

    ```
    [SwitchC] interface vlan-interface 101
    [SwitchC-Vlan-interface101] ipv6 pim dm
    [SwitchC-Vlan-interface101] quit
    ```

    # On Switch A, enable IPv6 multicast routing.

    ```
    <SwitchA> system-view
    [SwitchA] ipv6 multicast routing
    [SwitchA-mrib6] quit
    ```

    # Enable IPv6 PIM-DM on each interface.

    ```
    [SwitchA] interface vlan-interface 300
    [SwitchA-Vlan-interface300] ipv6 pim dm
    [SwitchA-Vlan-interface300] quit
    ```

```
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

42. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
[SwitchC] display ipv6 multicast rpf-info 500::100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B and Switch C.

43. Configure a static IPv6 multicast route:

Configure a static IPv6 multicast route on Switch B and specify Switch A as its RPF neighbor to Source 2.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 300::2
```

Configure a static IPv6 multicast route on Switch C and specify Switch B as its RPF neighbor to Source 2.

```
[SwitchC] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 50::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. These RPF routes are the configured static IPv6 multicast routes.

Configuring MLD

About MLD

Multicast Listener Discovery (MLD) establishes and maintains IPv6 multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

MLD versions

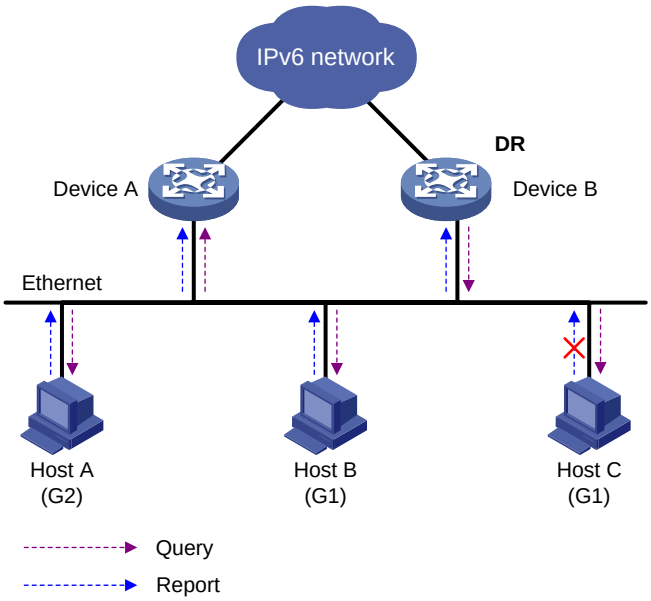
MLD has the following versions:

- MLDv1 (defined by RFC 2710), which is derived from IGMPv2.
- MLDv2 (defined by RFC 3810), which is derived from IGMPv3.

MLDv1 and MLDv2 support the ASM model. MLDv2 can directly implement the SSM model, but MLDv1 must work with the MLD SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."

How MLDv1 works

MLDv1 implements IPv6 multicast listener management based on the query and response mechanism.



Electing the MLD querier

All IPv6 multicast devices that run MLD on the same subnet can monitor MLD listener report messages (often called reports) from hosts. However, only one device can act as the MLD querier to send MLD query messages (often called queries). A querier election mechanism determines which device acts as the MLD querier on the subnet.

1. Initially, every MLD device assumes itself as the querier. Each device sends MLD general query messages (often called general queries) to all hosts and devices on the local subnet. The destination address of the general queries is FF02::1.
2. After receiving a general query, every MLD device compares the source IPv6 address of the query with its own link-local interface address. The device with the lowest IPv6 address wins the querier election and becomes the querier. All the other devices become non-queriers.
3. All the non-queriers start a timer called the "other querier present timer." If a device receives an MLD query from the querier before the timer expires, it resets this timer. Otherwise, it considers that the querier has timed out. In this case, the device initiates a new querier election process.

Joining an IPv6 multicast group

Figure 1 MLD queries and reports

As shown in Figure 1, Host B and Host C want to receive the IPv6 multicast data addressed to IPv6 multicast group G1. Host A wants to receive the IPv6 multicast data addressed to G2. The following process describes how the hosts join the IPv6 multicast groups and how the MLD querier (Device B in Figure 1) maintains the IPv6 multicast group memberships:

1. The hosts send unsolicited MLD reports to the IPv6 multicast groups they want to join without having to wait for the MLD queries.
2. The MLD querier periodically multicasts MLD queries (with the destination address FF02::1) to all hosts and devices on the local subnet.
3. After receiving a query, the host whose report delay timer expires first sends an MLD report to the IPv6 multicast group G1 to announce its membership for G1. In this example, Host B sends the report. After hearing the report from Host B, Host C, which is on the same subnet as Host B, suppresses its own report for G1.

   Because the MLD devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host MLD report suppression, helps reduce traffic on the local subnet.
4. At the same time, because Host A is interested in G2, it sends a report to the IPv6 multicast group G2.
5. Through the query/report process, the MLD devices determine that G1 and G2 have members on the local subnet. The IPv6 multicast routing protocol (for example, IPv6 PIM) that is running on the devices generates (*, G1) and (*, G2) multicast forwarding entries. These entries are the basis for subsequent IPv6 multicast forwarding. The asterisk (*) represents any IPv6 multicast source.
6. When the IPv6 multicast data addressed to G1 or G2 reaches an MLD device, the device looks up the IPv6 multicast forwarding table. Based on the (*, G1) and (*, G2) entries, the device forwards the IPv6 multicast data to the local subnet. Then, the receivers on the subnet receive the data.

Leaving an IPv6 multicast group

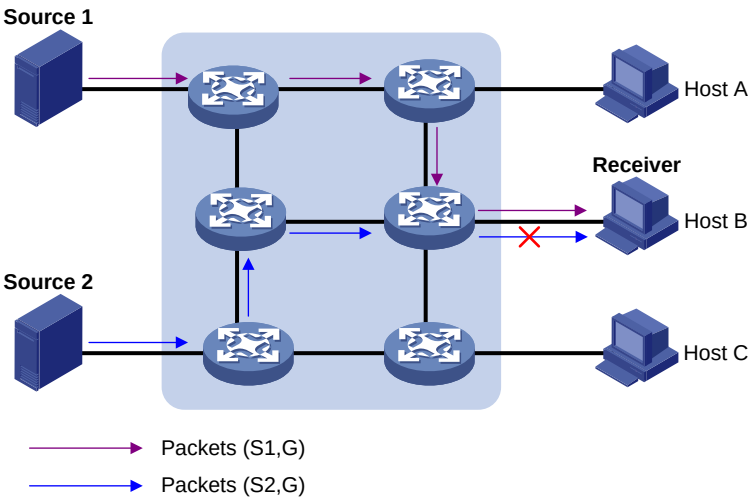
When a host is leaving an IPv6 multicast group, the following process occurs:

1. The host sends an MLD done message to all IPv6 multicast devices on the local subnet. The destination address of done messages is FF02::2.

2. After receiving the MLD done message, the querier sends a configurable number of multicast-address-specific queries to the group that the host is leaving. The IPv6 multicast addresses queried include both the destination address field and the group address field of the message.
3. One of the remaining members (if any on the subnet) in the group sends a report within the time of the maximum response time advertised in the multicast-address-specific queries.
4. If the querier receives a report for the group within the maximum response time, it maintains the memberships of the IPv6 multicast group. Otherwise, the querier assumes that no hosts on the subnet are interested in IPv6 multicast traffic addressed to that group and stops maintaining the memberships of the group.

MLDv2 enhancements

MLDv2 is based on and backwards-compatible with MLDv1. MLDv2 provides hosts with enhanced control capabilities and enhances the MLD state.



Enhancements in control capability of hosts

MLDv2 has introduced IPv6 multicast source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified IPv6 multicast sources. When a host joins an IPv6 multicast group, one of the following occurs:

- If the host expects IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host does not expect IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two IPv6 multicast sources, Source 1 (S1) and Source 2 (S2). Both of the sources can send IPv6 multicast data to IPv6 multicast group G. Host B wants to receive IPv6 multicast data addressed to G from Source 1 but not from Source 2.

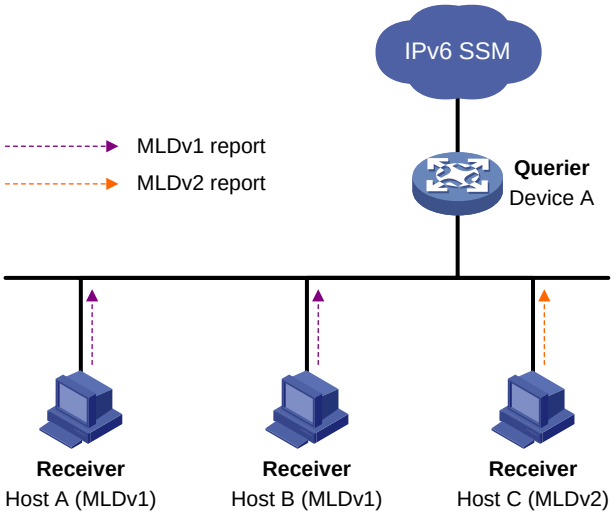
Figure 2 Flow paths of multicast-address-and-source-specific multicast traffic

In MLDv1, Host B cannot select IPv6 multicast sources when it joins IPv6 multicast group G. The IPv6 multicast streams from both Source 1 and Source 2 flow to Host B whether it needs them or not.

In MLDv2, Host B can explicitly express its interest in IPv6 multicast data destined to G from Source 1 but not from Source 2. Then, Host B receives only IPv6 multicast data from Source 1.

Enhancement in MLD state

A multicast device that is running MLDv2 maintains the multicast address state for each multicast address on each attached subnet. The multicast address state consists of the following information:



- **Filter mode**—Device keeps tracing the Include or Exclude state.
- **List of sources**—Device keeps tracing the newly added or deleted IPv6 multicast source.
- **Timers**—Filter timers, which include the time that the device waits before switching to the Include mode after an IPv6 multicast address times out, and source timers for source recording.

MLD SSM mapping

An MLDv2 host can explicitly specify multicast sources in its MLDv2 reports. From the reports, the MLD device can obtain the multicast source addresses and directly provide the SSM service. However, an MLDv1 host cannot specify multicast sources in its MLDv1 reports.

The MLD SSM mapping feature enables the MLD device to provide SSM support for MLDv1 receiver host. The device translates (*, G) in MLDv1 reports into (G, INCLUDE, (S1, S2...)) based on the configured MLD SSM mappings.

Figure 3 Network diagram

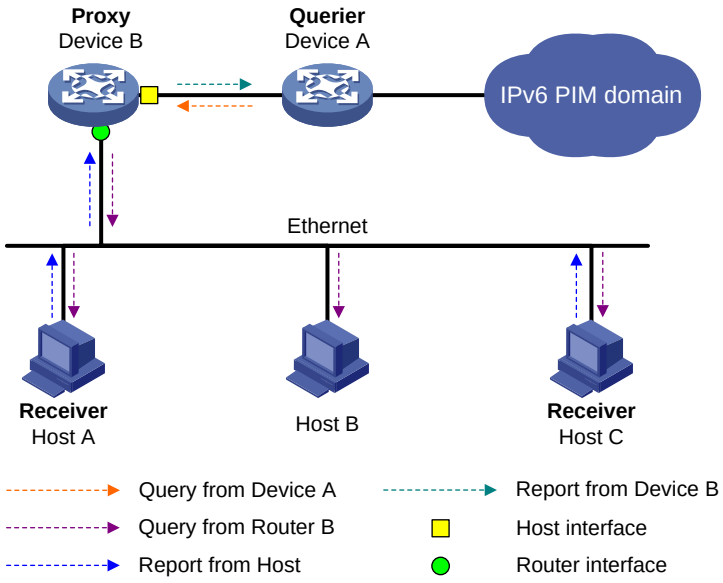
As shown in Figure 3, Host A and Host B on the IPv6 SSM network run MLDv1, and Host C runs MLDv2. To provide the SSM service for Host A and Host B, you must configure the MLD SSM mapping feature on Device A.

After MLD SSM mappings are configured, Device A checks the IPv6 multicast group address G carried in the message, and performs the following operations:

- If G is not in the IPv6 SSM group range, Device A provides the ASM service.
- If G is in the IPv6 SSM group range but does not match any MLD SSM mapping, Device A drops the report.
- If G is in the IPv6 SSM group range and matches MLD SSM mappings, Device A translates (*, G) in the report to (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The MLD SSM mapping feature does not process MLDv2 reports.



For more information about the IPv6 SSM group ranges, see "IPv6 PIM overview" and "Configuring IPv6 PIM."

MLD proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to configure IPv6 multicast routing protocols, such as IPv6 PIM, on edge devices. Instead, you can configure MLD proxying on these devices. With MLD proxying configured, the edge device acts as an MLD proxy:

- For the upstream MLD querier, the MLD proxy device acts as a host.
- For the downstream receiver hosts, the MLD proxy device acts as an MLD querier.

Figure 4 Network diagram

The following interfaces are defined in MLD proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running MLD. MLD proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running MLD. MLD must be configured on this interface.

An MLD proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or sends join/done messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received MLD reports.

MLD support for VPNs

MLD maintains group memberships on a per-interface basis. After receiving an MLD message on an interface, MLD processes the packet within the VPN to which the interface belongs. MLD only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*

- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*

Restrictions: Hardware compatibility with MLD

Only the S5136S-EI switch series supports MLD.

MLD tasks at a glance

To configure MLD, perform the following tasks:

1. Enabling MLD
2. (Optional.) Configuring basic MLD features
   - Specifying an MLD version
   - Configuring a static group member
   - Configuring an IPv6 multicast group policy
3. (Optional.) Adjusting MLD performance
   - Configuring MLD query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring MLD SSM mappings
5. (Optional.) Configuring MLD proxying
   - Enabling MLD proxying
   - Enabling IPv6 multicast forwarding on a non-querier interface
   - Enabling IPv6 multicast load splitting for MLD proxy interfaces
6. (Optional.) Enabling MLD NSR
7. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
8. (Optional.) Enabling SNMP notifications for MLD
9. (Optional.) Configuring MLD logging
   - Enabling MLD logging
   - Enabling log message suppression for MLD

Prerequisites for MLD

Before you configure MLD, you must configure an IPv6 unicast routing protocol so that all devices can interoperate at the network layer.

Enabling MLD

Restrictions and guidelines

Perform this task on interfaces where IPv6 multicast group memberships are created and maintained.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

By default, IPv6 multicast routing is disabled.

For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable MLD.
   mld enable

   By default, MLD is disabled.

Configuring basic MLD features

Specifying an MLD version

Restrictions and guidelines

For MLD to operate correctly, specify the same MLD version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an MLD version on the interface.
   mld version *version-number*

   By default, the MLD version on an interface is MLDv1.

Configuring a static group member

About this task

You can configure an interface as a static member of an IPv6 multicast group. Then, the interface can always receive IPv6 multicast data for the group.

A static group member does not respond to MLD queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited MLD report or done message.

Restrictions and guidelines

The interface to be configured as a static member of an IPv6 multicast group has the following restrictions:

- If the interface is MLD and IPv6 PIM-SM enabled, it must be an IPv6 PIM-SM DR.
- If the interface is MLD enabled but not IPv6 PIM-SM enabled, it must be an MLD querier.

For more information about IPv6 PIM-SM and DR, see "IPv6 PIM overview."

When you configure an interface as a static group member of IPv6 multiple multicast groups or multicast sources and groups in batch, follow these restrictions and guidelines:

- IPv6 multicast group addresses in different batch configurations can overlap.

- The **undo mld static-group** command does not support deleting one IPv6 multicast group from batch configuration. When you delete a batch configuration, make sure the setting in the **undo** command matches the batch configuration.
- If two batch configurations have the same parameter settings except the setting of the **number** *group-number* option, the new configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a static group member.
   mld static-group *ipv6-group-address* [**inc-step-mask** *group-mask-length* **number** *group-number*] [**source** *ipv6-source-address*]
   By default, an interface is not a static group member.

Configuring an IPv6 multicast group policy

About this task

This feature enables an interface to filter MLD reports by using an ACL that specifies IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send MLD reports.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 multicast group policy on the interface.
   mld group-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* } [*version-number*]
   By default, the hosts attached to an interface can join any IPv6 multicast group policy.

Adjusting MLD performance

Configuring MLD query and response parameters

About this task

The following are MLD query and response parameters:

- **MLD querier's robustness variable**—Number of times for retransmitting MLD queries in case of packet loss. A higher robustness variable makes the MLD querier more robust, but increases the timeout time for IPv6 multicast groups.

- **MLD startup query interval**—Interval at which an MLD querier sends MLD general queries at startup.
- **MLD startup query count**—Number of MLD general queries that an MLD querier sends at startup.
- **MLD general query interval**—Interval at which an MLD querier sends MLD general queries to check for IPv6 multicast group members on the network.
- **MLD last listener query interval**—In MLDv1, it sets the interval at which a querier sends multicast-address-specific queries after receiving a done message. In MLDv2, it sets the interval at which a querier sends multicast-address-and-source-specific queries after receiving a report that changes IPv6 multicast source and group mappings.
- **MLD last listener query count**—In MLDv1, it sets the number of multicast-address-specific queries that the querier sends after receiving a done message. In MLDv2, it sets the number of multicast-address-and-source-specific queries that the querier sends after receiving a report that changes IPv6 multicast group and source mappings.
- **MLD maximum response time**—Maximum time before a receiver responds with a report to an MLD general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the MLD query. When the timer value decreases to 0, the receiver sends an MLD report to the group.
- **MLD other querier present timer**—Lifetime for an MLD querier after a non-querier receives an MLD general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

- To avoid frequent MLD querier changes, set the MLD other querier present timer greater than the MLD general query interval. In addition, configure the same MLD other querier present timer for all MLD devices on the same subnet.
- To speed up the response to MLD queries and avoid simultaneous timer expirations that cause MLD report traffic bursts, you must set an appropriate maximum response time.
  - For MLD general queries, the maximum response time is set by the **max-response-time** command.
  - For MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, the maximum response time equals the MLD last listener query interval.
- You can configure MLD query and response parameters globally for all interfaces in MLD view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the MLD query and response parameters globally

1. Enter system view.

   system-view
2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]
3. Set the MLD querier's robustness variable.

   robust-count *count*

   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.

   startup-query-interval *interval*

   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.

   startup-query-count *count*

By default, the MLD startup query count is equal to the MLD querier's robustness variable.

6. Set the MLD general query interval.

   query-interval *interval*

   By default, the MLD general query interval is 125 seconds.

7. Set the MLD last listener query interval.

   last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.

8. Set the MLD last listener query count.

   last-listener-query-count *count*

   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.

9. Set the maximum response time for MLD general queries.

   max-response-time *time*

   By default, the maximum response time for MLD general queries is 10 seconds.

10. Set the MLD other querier present timer.

    other-querier-present-timeout *time*

    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Configuring the MLD query and response parameters on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the MLD querier's robustness variable.

   mld robust-count *count*

   By default, the MLD querier's robustness variable is 2.

4. Set the MLD startup query interval.

   mld startup-query-interval *interval*

   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.

5. Set the MLD startup query count.

   mld startup-query-count *count*

   By default, the MLD startup query count is equal to the MLD querier's robustness variable.

6. Set the MLD general query interval.

   mld query-interval *interval*

   By default, the MLD general query interval is 125 seconds.

7. Set the MLD last listener query interval.

   mld last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.

8. Set the MLD last listener query count.

   mld last-listener-query-count *count*

   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.

9. Set the maximum response time for MLD general queries.

   mld max-response-time *time*

By default, the maximum response time for MLD general queries is 10 seconds.

10. Set the MLD other querier present timer.

    mld other-querier-present-timeout *time*

    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an MLD querier to send leave notifications to the upstream without sending multicast-address-specific or multicast-address-and-source-specific queries after receiving a done message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable fast-leave processing.

   mld fast-leave [**group-policy** *ipv6-acl-number*]

   By default, fast-leave processing is disabled.

Configuring MLD SSM mappings

About this task

This feature enables the device to provide SSM services for MLDv1 hosts.

Restrictions and guidelines

This feature does not process MLDv2 messages. Enable MLDv2 on the receiver-side interface to ensure that MLDv2 reports from MLDv2 receiver hosts can be processed.

Procedure

1. Enter system view.

   system-view

2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]

3. Configure an MLD SSM mapping.

   ssm-mapping *ipv6-source-address* { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no MLD SSM mapping is configured.

Configuring MLD proxying

Prerequisites for MLD proxying

Before you configure MLD proxying, determine the router interfaces and host interface based on the network topology. Then, enable MLD on the router interfaces.

Enabling MLD proxying

Restrictions and guidelines

- Enable MLD proxying on the receiver-side interfaces.
- If MLD proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward multicast traffic.
- On an interface enabled with MLD proxying, only the **mld version** command takes effect and other MLD commands do not take effect.
- If you enable both MLD proxying and an IPv6 multicast routing protocol on the same device, the IPv6 multicast routing protocol does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MLD proxying.
   mld proxy enable
   By default, MLD proxying is disabled.

Enabling IPv6 multicast forwarding on a non-querier interface

About this task

Typically, only MLD queriers can forward IPv6 multicast traffic and non-queriers cannot. This prevents IPv6 multicast data from being repeatedly forwarded. If a router interface on the MLD proxy failed the querier election, enable IPv6 multicast forwarding on the interface to forward IPv6 multicast data to downstream receivers.

Restrictions and guidelines

A shared-media network might have multiple MLD proxies, including one proxy acting as a querier. To avoid duplicate IPv6 multicast traffic, do not enable IPv6 multicast forwarding on any of the non-querier MLD proxies for the network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IPv6 multicast forwarding on a non-querier interface.
   mld proxy forwarding
   By default, IPv6 multicast forwarding is disabled on a non-querier interface.

Enabling IPv6 multicast load splitting for MLD proxy interfaces

About this task

If multiple MLD proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards IPv6 multicast traffic. You can enable IPv6 multicast load splitting on the device so that all the proxy interfaces can share IPv6 multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Enable IPv6 multicast load splitting for MLD proxy interfaces.
   proxy multipath
   By default, IPv6 multicast load splitting is disabled for MLD proxy interfaces.

Enabling MLD NSR

About this task

This feature backs up information about MLD interfaces and MLD multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the IPv6 multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable MLD NSR.
   mld non-stop-routing
   By default, MLD NSR is disabled.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*

By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD

About this task

To report critical MLD events to an SNMP NMS, enable SNMP notifications for MLD.

For MLD SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enable SNMP notifications for MLD.
   `snmp-agent trap enable mld` [**`join`** | **`leave`**] *
   By default, SNMP notifications are enabled for MLD.

Configuring MLD logging

Enabling MLD logging

About this task

To report critical MLD events to the information center, enable MLD logging. For MLD log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable MLD logging or use the **`mld log suppress`** command to enable log message suppression for MLD.

Procedure

1. Enter system view.
   `system-view`
2. Enable MLD logging.
   `mld log enable` [**`group`**]
   MLD logging is enabled by default.

Enabling log message suppression for MLD

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for MLD. With this feature configured, the speed of sending MLD log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure MLD logging has been enabled using the **mld log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for MLD.
   mld log suppress [**group**]
   By default, log message suppression is enabled for MLD.

Display and maintenance commands for MLD

CAUTION:
The **reset mld group** command might cause IPv6 multicast data transmission failures.

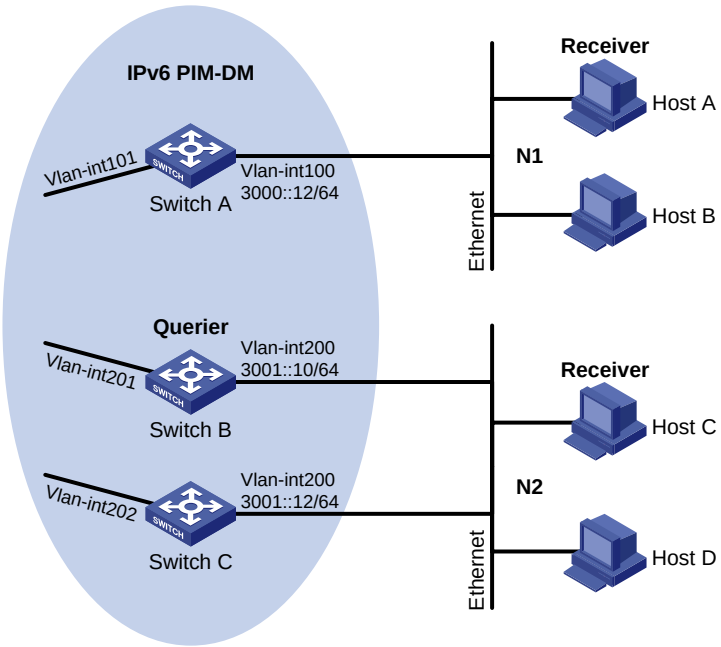
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about MLD multicast groups.	**display mld** [**vpn-instance** *vpn-instance-name*] **group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display MLD information for interfaces.	**display mld** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**proxy**] [**verbose**]
Display IPv6 multicast routing entries maintained by the MLD proxy.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display information about the MLD proxy routing table.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*]] * [**verbose**]
Display MLD SSM mappings.	**display mld** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*
Clear dynamic MLD multicast group entries.	**reset mld** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

MLD configuration examples

Example: Configuring basic MLD features

Network configuration



As shown in Figure 5:

- OSPFv3 and IPv6 PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are multicast receiver hosts in N1 and N2, respectively.
- MLDv1 runs between Switch A and N1, and between the other two switches (Switch B and Switch C) and N2.
- Switch A acts as the MLD querier in N1. Switch B acts as the MLD querier in N2 because it has a lower IPv6 address.

Configure the switches to meet the following requirements:

- The hosts in N1 can join only IPv6 multicast group FF1E::101.
- The hosts in N2 can join any IPv6 multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 5, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable the IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

Enable MLD on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-DM on VLAN-interface 101.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim dm
[SwitchA-Vlan-interface101] quit
```

On Switch B, enable IPv6 multicast routing.

```
<SwitchB> system-view
[SwitchB] ipv6 multicast routing
[SwitchB-mrib6] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] mld enable
[SwitchB-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] ipv6 pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IPv6 multicast routing.

```
<SwitchC> system-view
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] mld enable
[SwitchC-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] ipv6 pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure an IPv6 multicast group policy on Switch A so that the hosts connected to VLAN-interface 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display MLD information for VLAN-interface 200 on Switch B.

```
[SwitchB] display mld interface vlan-interface 200
 Vlan-interface200(FE80::200:5EFF:FE66:5100):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
```

```
  Other querier present time for MLD: 255s
  Maximum query response time for MLD: 10s
  Querier for MLD: FE80::200:5EFF:FE66:5100 (This router)
MLD groups reported in total: 1
```

Example: Configuring MLD SSM mapping

Network configuration

As shown in Figure 6:

- OSPFv3 runs on the network.
- The IPv6 PIM-SM domain uses the SSM model for IPv6 multicast delivery. The SSM group range is FF3E::/64.
- MLDv2 runs on VLAN-interface 400 of Switch D. The receiver host runs MLDv1, and does not support MLDv2. The receiver host cannot specify IPv6 multicast sources in its membership reports.
- Source 1, Source 2, and Source 3 send IPv6 multicast packets to multicast groups in IPv6 SSM group range FF3E::/64.

Configure the MLD SSM mapping feature on Switch D so that the receiver host will receive IPv6 multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

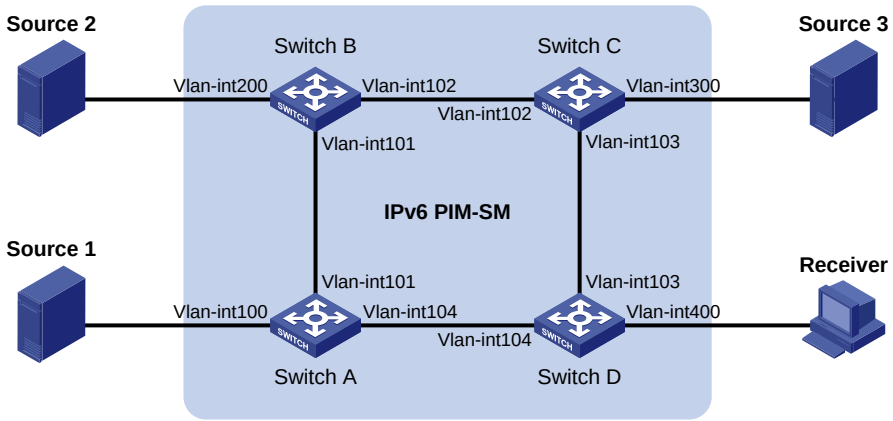


Table 1 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	1001::1/64	Source 3	—	3001::1/64
Source 2	—	2001::1/64	Receiver	—	4001::1/64
Switch A	Vlan-int100	1001::2/64	Switch C	Vlan-int300	3001::2/64
Switch A	Vlan-int101	1002::1/64	Switch C	Vlan-int103	3002::1/64
Switch A	Vlan-int104	1003::1/64	Switch C	Vlan-int102	2002::2/64
Switch B	Vlan-int200	2001::2/64	Switch D	Vlan-int400	4001::2/64
Switch B	Vlan-int101	1002::2/64	Switch D	Vlan-int103	3002::2/64
Switch B	Vlan-int102	2002::1/64	Switch D	Vlan-int104	1003::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Table 1, and configure OSPFv3 on the switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, and enable IPv6 PIM-SM and MLD:

On Switch D, enable IPv6 multicast routing.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
```

Enable MLDv2 on the receiver-side interface (VLAN-interface 400).

```
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] mld enable
[SwitchD-Vlan-interface400] mld version 2
[SwitchD-Vlan-interface400] quit
```

Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] ipv6 pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] ipv6 pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range:

On Switch D, specify FF3E::/64 as the IPv6 SSM group range.

```
[SwitchD] acl ipv6 basic 2000
[SwitchD-acl-ipv6-basic-2000] rule permit source ff3e:: 64
[SwitchD-acl-ipv6-basic-2000] quit
[SwitchD] pim ipv6
[SwitchD-pim6] ssm-policy 2000
[SwitchD-pim6] quit
```

Configure Switch A, Switch B and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure MLD SSM mappings on Switch D.

```
[SwitchD] mld
[SwitchD-mld] ssm-mapping 1001::1 2000
[SwitchD-mld] ssm-mapping 3001::1 2000
[SwitchD-mld] quit
```

Verifying the configuration

Display MLD SSM mappings for IPv6 multicast group FF3E::101 on Switch D.

```
[SwitchD] display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
        1001::1
        3001::1
```

On Switch D, display information about MLD multicast groups that hosts have dynamically joined.

```
[SwitchD] display mld group
MLD groups in total: 1
 Vlan-interface400(FE80::101):
  MLD groups reported in total: 1
   Group address: FF3E::101
    Last reporter: FE80::1
    Uptime: 00:02:04
    Expires: Off
```

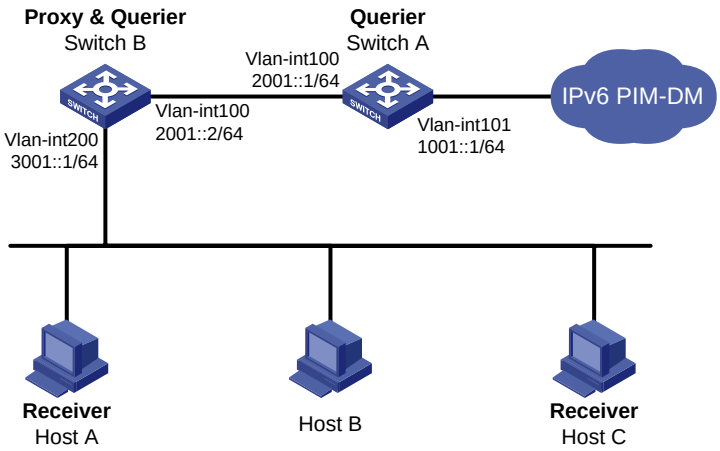
Display IPv6 PIM routing entries on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (1001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -

 (3001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -
```

Example: Configuring MLD proxying



Network configuration

As shown in Figure 7:

- IPv6 PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information destined to IPv6 multicast group FF3E::101.

Configure the MLD proxying feature on Switch B so that Switch B can maintain group memberships and forward IPv6 multicast traffic without running IPv6 PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 7.

Procedure

1. Enable IPv6 multicast routing, IPv6 PIM-DM, MLD, and MLD proxying:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast ipv6 routing-enable
   [SwitchB-mrib6] quit
   ```

   # Enable MLD proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   ```

```
[SwitchB-Vlan-interface100] mld proxying enable
[SwitchB-Vlan-interface100] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] mld enable
[SwitchB-Vlan-interface200] quit
```

Verifying the configuration

Display IPv6 multicast group membership information maintained by the MLD proxy on Switch B.

```
[SwitchB] display mld proxy group
MLD proxy group records in total: 1
 Vlan-interface100(FE80::16:1):
  MLD proxy group records in total: 1
   Group address: FF1E::1
    Member state: Delay
    Expires: 00:00:02
```

Troubleshooting MLD

No member information exists on the receiver-side device

Symptom

When a host sends a message to announce that it is joining IPv6 multicast group G, no member information of multicast group G exists on the immediate device.

Solution

To resolve the problem:

1. Use the **`display mld interface`** command to verify that the networking, interface connections, and IP address configuration are correct.
2. Use the **`display current-configuration`** command to verify that the IPv6 multicast routing is enabled. If it is not enabled, use the **`ipv6 multicast routing`** command in system view to enable IPv6 multicast routing. In addition, verify that MLD is enabled on the associated interfaces.
3. Use the **`display mld interface`** command to verify that the MLD version on the interface is lower than that on the host.
4. Use the **`display current-configuration interface`** command to verify that no IPv6 multicast group policies have been configured to filter MLD reports for IPv6 multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different MLD devices on the same subnet.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the MLD information on the interface. Make sure the devices on the subnet have the same MLD settings on their interfaces.
2. Use the **display mld interface** command on all devices on the same subnet to check the MLD timers for inconsistent configurations.
3. Use the **display mld interface** command to verify that all devices are running the same MLD version.
4. If the problem persists, contact H3C Support.

IPv6 PIM overview

IPv6 Protocol Independent Multicast (IPv6 PIM) provides IPv6 multicast forwarding by leveraging IPv6 unicast static routes or IPv6 unicast routing tables generated by any IPv6 unicast routing protocol. IPv6 PIM uses the underlying IPv6 unicast routing to generate an IPv6 multicast routing table without relying on any particular IPv6 unicast routing protocol.

IPv6 PIM uses the RPF mechanism to implement IPv6 multicast forwarding. For more information about RPF, see "Configuring IPv6 multicast routing and forwarding."

IPv6 PIM modes

Based on the implementation mechanism, IPv6 PIM includes the following modes:

- IPv6 Protocol Independent Multicast–Dense Mode (IPv6 PIM-DM).
- IPv6 Protocol Independent Multicast–Sparse Mode (IPv6 PIM-SM).
- IPv6 Protocol Independent Multicast Source-Specific Multicast (IPv6 PIM-SSM).

In this document, an IPv6 PIM domain refers to a network composed of IPv6 PIM devices.

IPv6 PIM-DM

IPv6 PIM-DM uses the push mode for multicast forwarding and is suitable for small networks with densely distributed IPv6 multicast members.

IPv6 PIM-DM assumes that all downstream nodes want to receive IPv6 multicast data from a source, so IPv6 multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees, leaving only those branches that contain receivers. When the pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In IPv6 PIM-DM, the multicast forwarding paths for an IPv6 multicast group constitute a forwarding tree. The forwarding tree is rooted at the IPv6 multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the IPv6 multicast source to the receivers, it is also called a "shortest path tree (SPT)."

IPv6 PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

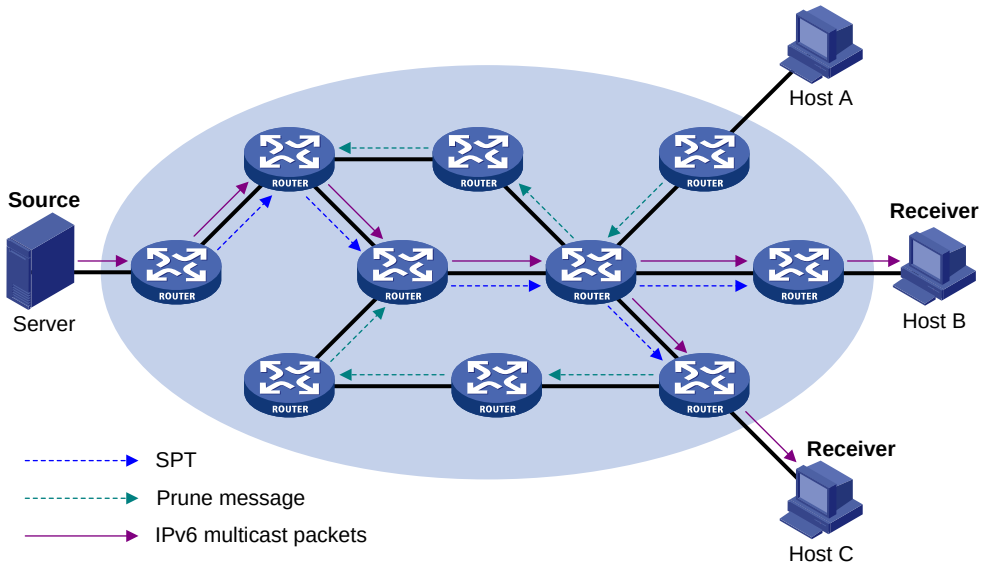
Neighbor discovery

In an IPv6 PIM domain, each IPv6 PIM interface periodically multicasts IPv6 PIM hello messages to all other IPv6 PIM devices on the local subnet. Through the exchanging of hello messages, all IPv6 PIM devices determine their IPv6 PIM neighbors, maintain IPv6 PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In an IPv6 PIM-DM domain, the IPv6 multicast data from the IPv6 multicast source S to the IPv6 multicast group G is flooded throughout the domain. A device performs an RPF check on the IPv6 multicast data. If the check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes in the network. In the flooding process, all the devices in the IPv6 PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all IPv6 PIM devices on the subnet. When the upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that IPv6 multicast group down to this node.

NOTE:

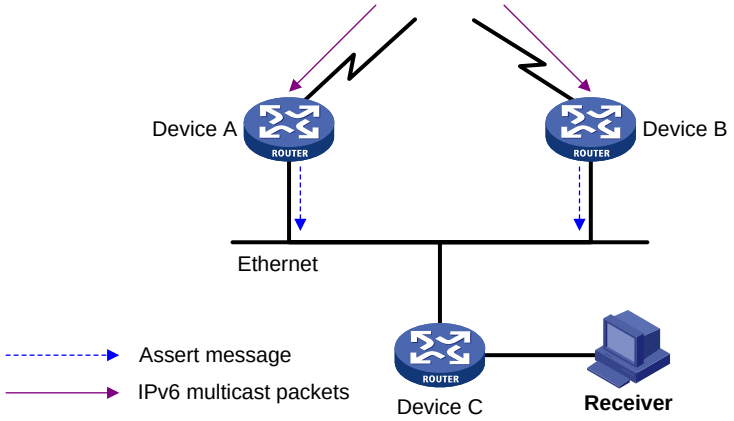
An (S, G) entry contains an IPv6 multicast source address S, an IPv6 multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the IPv6 multicast source. This prune process goes on until only necessary branches are left in the IPv6 PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, IPv6 multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the IPv6 multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all IPv6 PIM devices on the local subnet through the interface that received the packet. The assert message contains the IPv6 multicast source address (S), the IPv6 multicast group address (G), and the metric preference and metric of the IPv6 unicast route/static multicast route to the IPv6 multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the subnet. The comparison process is as follows:

1. The device with a higher metric preference to the IPv6 multicast source wins.
2. If both devices have the same metric preference to the IPv6 multicast source, the device with a smaller metric to the IPv6 multicast source wins.
3. If both devices have the same metric, the device with a higher IPv6 link-local address on the downstream interface wins.

IPv6 PIM-SM

IPv6 PIM-DM uses the flood-and-prune cycles to build SPTs for IPv6 multicast data forwarding. Although an SPT has the shortest paths from the IPv6 multicast source to the receivers, it is built with a low efficiency. Therefore, IPv6 PIM-DM is not suitable for large- and medium-sized networks.

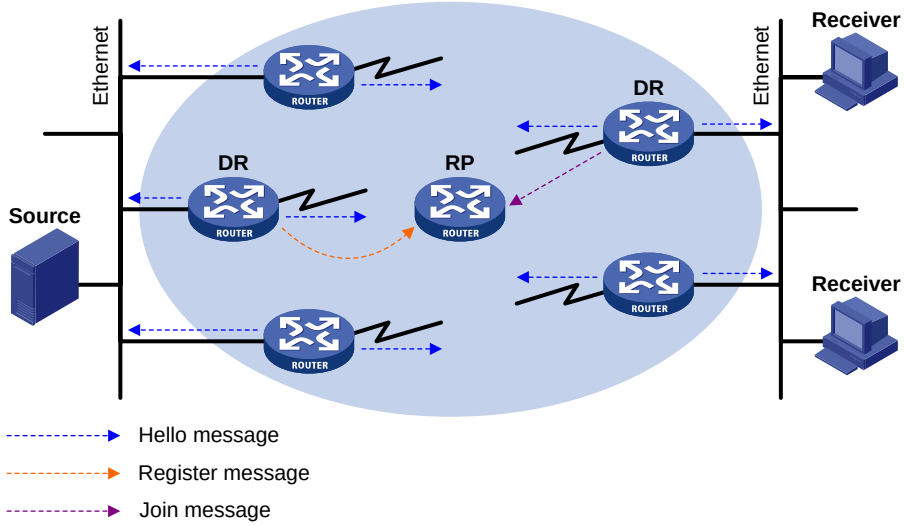
IPv6 PIM-SM uses the pull mode for IPv6 multicast forwarding, and it is suitable for large-sized and medium-sized networks with sparsely and widely distributed IPv6 multicast group members.

IPv6 PIM-SM assumes that no hosts need IPv6 multicast data. A multicast receiver must express its interest in the IPv6 multicast data for an IPv6 multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of an IPv6 PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement IPv6 multicast data forwarding. An SPT is rooted at the IPv6 multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

IPv6 PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

IPv6 PIM-SM uses the same neighbor discovery mechanism as IPv6 PIM-DM does. For more information, see "Neighbor discovery."



DR election

A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the IPv6 multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the receiver hosts to send join messages to the RP.

IMPORTANT:

MLD must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any IPv6 multicast groups. For more information about MLD, see "Configuring MLD."

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IPv6 link-local address wins the DR election under one of the following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its IPv6 PIM neighbor lifetime expires, and the other devices initiate a new DR election.

RP discovery

An RP is the core of an IPv6 PIM-SM domain. An IPv6 multicast group can have only one RP for IPv6 multicast forwarding, and an RP can be designated to multiple IPv6 multicast groups.

RP selection mechanism

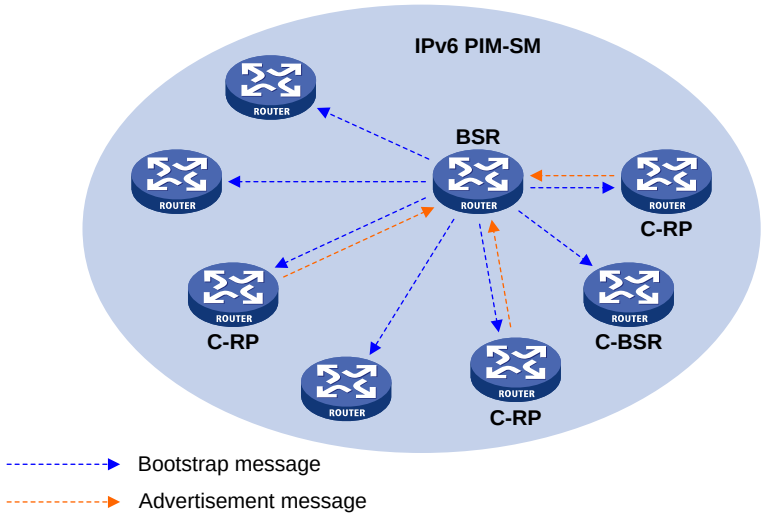
An RP can be statically configured, dynamically elected, or extracted from an IPv6 multicast address with embedded RP. The embedded RP takes precedence over the static RP and the dynamic RP. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs

A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election



Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to an IPv6 multicast group.
- **BSR**—A BSR is the core of the administrative core of the IPv6 PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. An IPv6 PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the IPv6 PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

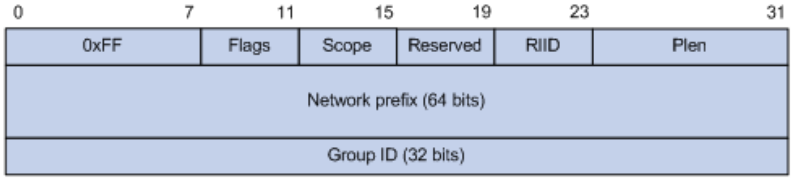
NOTE:

A device can act as a C-RP and a C-BSR at the same time.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

1. Each C-BSR sends a BSM to other devices in the IPv6 PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IPv6 address wins. The loser uses the winner's



BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.

3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the IPv6 multicast group range to which it is designated.
4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between IPv6 multicast groups and RPs. The BSR encapsulates the RP-set information in the BSMs and advertises the BSMs to the entire IPv6 PIM-SM domain.
5. All devices in the IPv6 PIM-SM domain select an RP for an IPv6 multicast group based on the following rules:
   a. The C-RP that is designated to the smallest IPv6 multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Embedded RP

The embedded RP mechanism enables a device to resolve the RP address from an IPv6 multicast group address to map the IPv6 multicast group to an RP. This RP can take the place of the configured static RP or the RP dynamically elected by the bootstrap mechanism. A DR does not need to learn the RP address beforehand. Figure 5 shows the format of an IPv6 multicast group address with embedded RP.

Figure 5 Format of an IPv6 multicast address with embedded RP

As shown in Figure 5, the requirements for each field are as follows:

- **First 8 bits**—Fixed to 0xFF.
- **Flags**—The R, P, and T bits must be set to 1.
- **Reserved**—Contains 4 bits and must be set to 0.
- **RIID**—Contains 4 bits and indicates the RP interface ID.
- **Plen**—Contains 8 bits and indicates the valid length (in bits) of the RP address prefix. This field value cannot be greater than 64 and cannot be 0.
- **Network prefix**—Contains 64 bits and indicates the prefix of the RP address. The valid length of the prefix is determined by the Plen field.
- **Group ID**—Reduced to 32 bits and indicates the ID of the IPv6 multicast group.

The process of discovering an embedded RP is as follows:

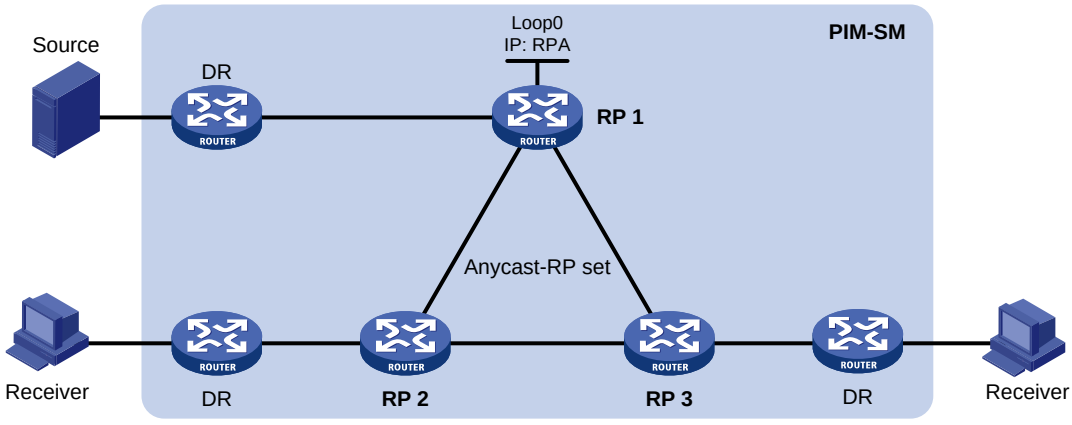
- At the receiver side, a receiver host initiates an MLD report to join an IPv6 multicast group. Upon receiving the MLD report, the receiver-side DR resolves the RP address embedded in the IPv6 multicast group address and uses the RP for the IPv6 multicast group.
- At the IPv6 multicast source side, the IPv6 multicast source sends an IPv6 multicast packet to an IPv6 multicast group. Upon receiving the IPv6 multicast packet, the source-side DR resolves

the RP address embedded in the IPv6 multicast address and uses the RP for the IPv6 multicast group.

Anycast RP

IPv6 PIM-SM requires only one active RP to serve each IPv6 multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IPv6 address for one multicast group. An IPv6 multicast source registers with the closest RP or a receiver-side DR joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—An IPv6 multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented by using either of the following methods:

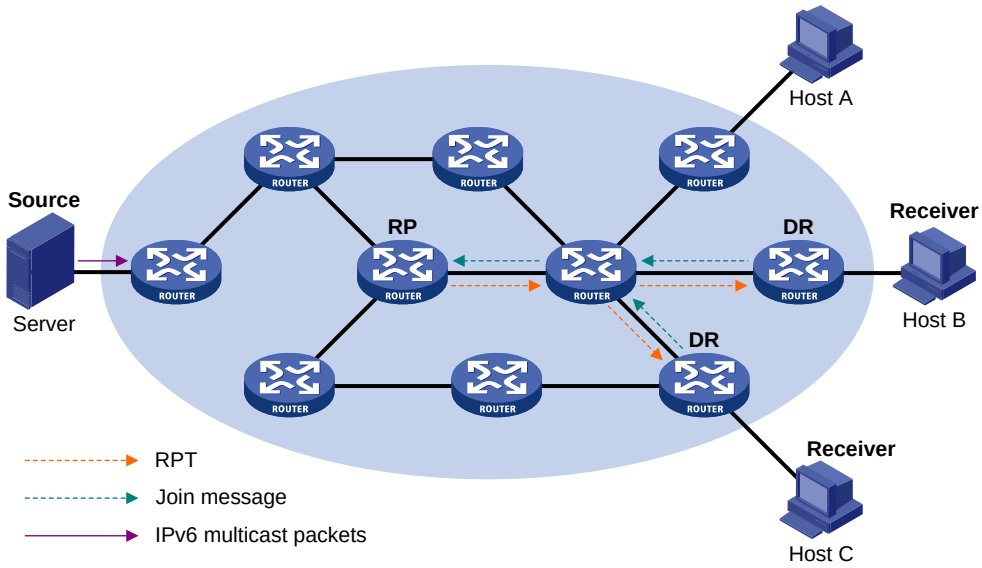
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through IPv6 PIM-SM**—In this method, you can configure multiple RPs for one IPv6 multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same IPv6 multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IPv6 address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IPv6 address of the Anycast RP set for communication within the IPv6 PIM-SM domain. It is also known as RPA.

  As shown in Figure 6, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 6 Anycast RP through IPv6 PIM-SM

The following describes how Anycast RP through IPv6 PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IPv6 address of the register message to its own IPv6 address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

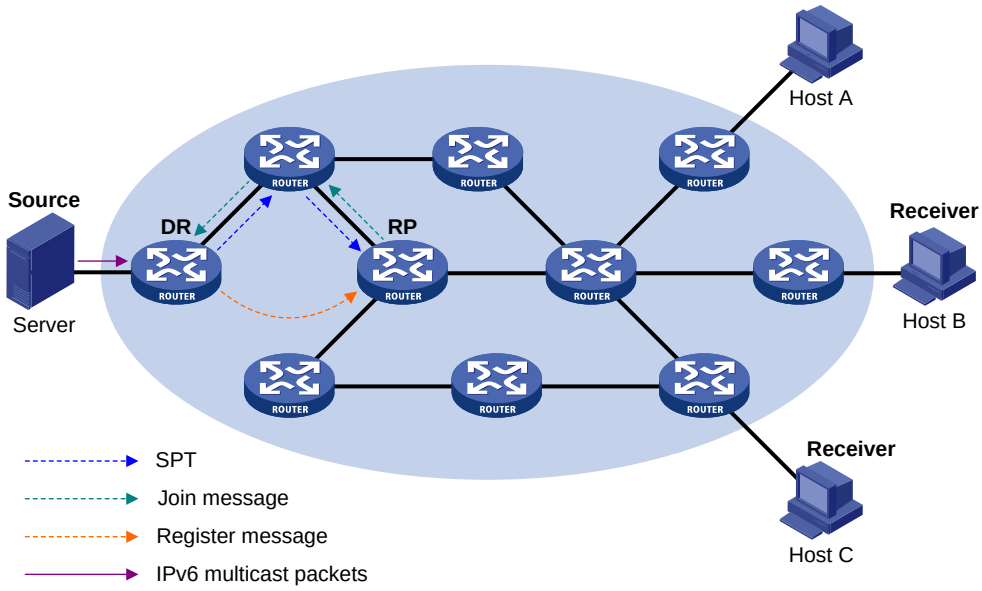
In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize IPv6 multicast source information.

RPT building

Figure 7 RPT building in an IPv6 PIM-SM domain

As shown in Figure 7, the process of building an RPT is as follows:

1. When a receiver wants to join the IPv6 multicast group G, it uses an MLD message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the IPv6 multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any IPv6 multicast source. The RPT is rooted at the RP and has the DR as its leaf.



When the IPv6 multicast data addressed to the IPv6 multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT. Finally, the DR forwards the IPv6 multicast data to the receiver hosts.

When a receiver is no longer interested in the IPv6 multicast data addressed to the IPv6 multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that IPv6 multicast group. If no receivers for the IPv6 multicast group exist, the device continues to forward the prune message to its upstream device.

IPv6 multicast source registration

The IPv6 multicast source uses the registration process to inform an RP of its presence.

Figure 8 IPv6 multicast source registration

As shown in Figure 8, the IPv6 multicast source registers with the RP as follows:

1. The IPv6 multicast source S sends the first multicast packet to the IPv6 multicast group G. When receiving the multicast packet, the source-side DR that directly connects to the IPv6 multicast source encapsulates the packet into a register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates it and forwards it down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent IPv6 multicast data from the IPv6 multicast source are forwarded to the RP along the SPT. When the IPv6 multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

In an IPv6 PIM-SM domain, only one RP and one RPT provide services for a specific IPv6 multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all IPv6 multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

IPv6 multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for an IPv6 multicast packet might not be the shortest one.
- The RP might be overloaded by IPv6 multicast traffic bursts.

To eliminate these weaknesses, IPv6 PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives IPv6 multicast traffic:

- The RP initiates the switchover to SPT:

  If the RP receives IPv6 multicast traffic, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. The subsequent IPv6 multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

For more information about the switchover to SPT initiated by the RP, see "IPv6 multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives IPv6 multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the device where the RPT and the SPT branches, the device drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the IPv6 multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent IPv6 multicast packets for the IPv6 multicast group travel along the SPT from the IPv6 multicast source to the receiver hosts.

With the switchover to SPT, IPv6 PIM-SM builds SPTs more economically than IPv6 PIM-DM does.

Assert

IPv6 PIM-SM uses a similar assert mechanism as IPv6 PIM-DM does. For more information, see "Assert."

IPv6 administrative scoping

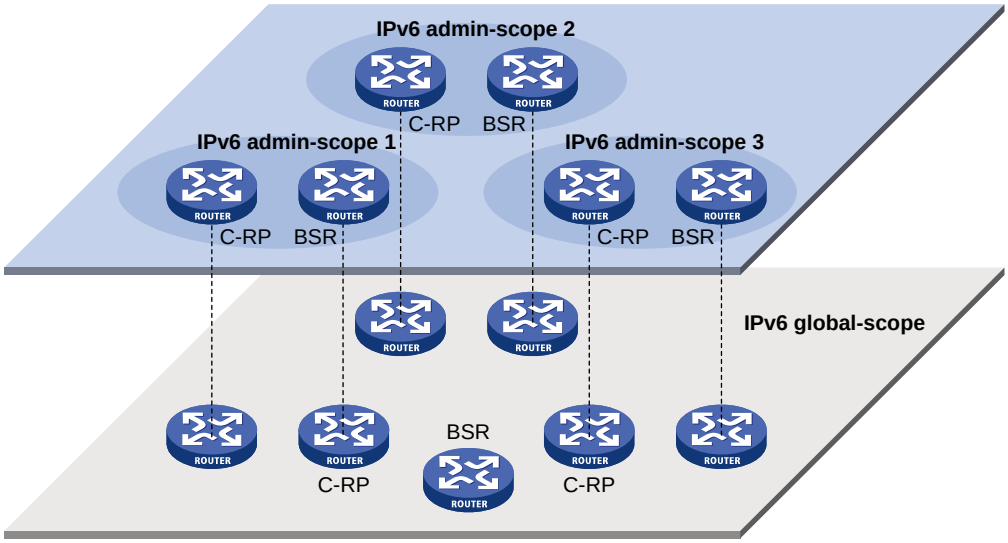
IPv6 administrative scoping mechanism

IPv6 administrative scoping mechanisms for IPv6 PIM-SM include IPv6 non-scoped BSR mechanism and IPv6 administrative scoping mechanism.

- **IPv6 non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **IPv6 administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (IPv6 admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

An IPv6 admin-scoped zone is designated to particular IPv6 multicast groups with the same scope field value in their group addresses. Zone border routers (ZBRs) form the boundary of an IPv6 admin-scoped zone. Each IPv6 admin-scoped zone maintains one BSR for IPv6 multicast groups with the same scope field value. IPv6 multicast protocol packets, such as assert messages and BSMs, of these IPv6 multicast groups cannot cross the boundary of the IPv6 admin-scoped zone for the group range. The IPv6 multicast group ranges to which different IPv6 admin-scoped zones are designated can have intersections. However, the IPv6 multicast groups in an IPv6 admin-scoped zone are valid only within its local zone, and theses IPv6 multicast groups are regarded as private group addresses.

The IPv6 global-scoped zone can be regarded as a special IPv6 admin-scoped zone, and it maintains a BSR for the IPv6 multicast groups with the scope field value as 14.



Relationship between IPv6 admin-scoped zones and the IPv6 global-scoped zone

The IPv6 global-scoped zone and each IPv6 admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each IPv6 admin-scoped zone has its own boundary. The IPv6 multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the IPv6 global-scoped zone and IPv6 admin-scoped zones based on geographical locations and the scope field values.

- In view of geographical locations:

  An IPv6 admin-scoped zone is a logical zone for particular IPv6 multicast groups with the same scope field value. The IPv6 multicast packets for such IPv6 multicast groups are confined within the local IPv6 admin-scoped zone and cannot cross the boundary of the zone.

  Figure 9 Relationship in view of geographical locations

  As shown in Figure 9, for the IPv6 multicast groups with the same scope field value, the IPv6 admin-scoped zones must be geographically separated and isolated. The IPv6 global-scoped zone includes all devices in the IPv6 PIM-SM domain. IPv6 multicast packets that do not belong to any IPv6 admin-scoped zones are forwarded in the entire IPv6 PIM-SM domain.

- In view of the scope field values:

  In terms of the scope field values, the scope field in an IPv6 multicast group address shows the zone to which the IPv6 multicast group belongs.

  Figure 10 IPv6 multicast address format

  An IPv6 admin-scoped zone with a larger scope field value contains an IPv6 admin-scoped zone with a smaller scope field value. The zone with the scope field value of E is the IPv6 global-scoped zone. Table 1 lists the possible values of the scope field.

Table 1 Values of the Scope field

Value	Meaning	Remarks
0, F	Reserved	N/A
1	Interface-local scope	N/A
2	Link-local scope	N/A
3	Subnet-local scope	IPv6 admin-scoped zone.
4	Admin-local scope	IPv6 admin-scoped zone.
5	Site-local scope	IPv6 admin-scoped zone.
6, 7, 9 through D	Unassigned	IPv6 admin-scoped zone.
8	Organization-local scope	IPv6 admin-scoped zone.
E	Global scope	IPv6 global-scoped zone.

IPv6 PIM-SSM

The ASM model includes IPv6 PIM-DM and IPv6 PIM-SM. The SSM model can be implemented by leveraging part of the IPv6 PIM-SM technique. It is also called "IPv6 PIM-SSM."

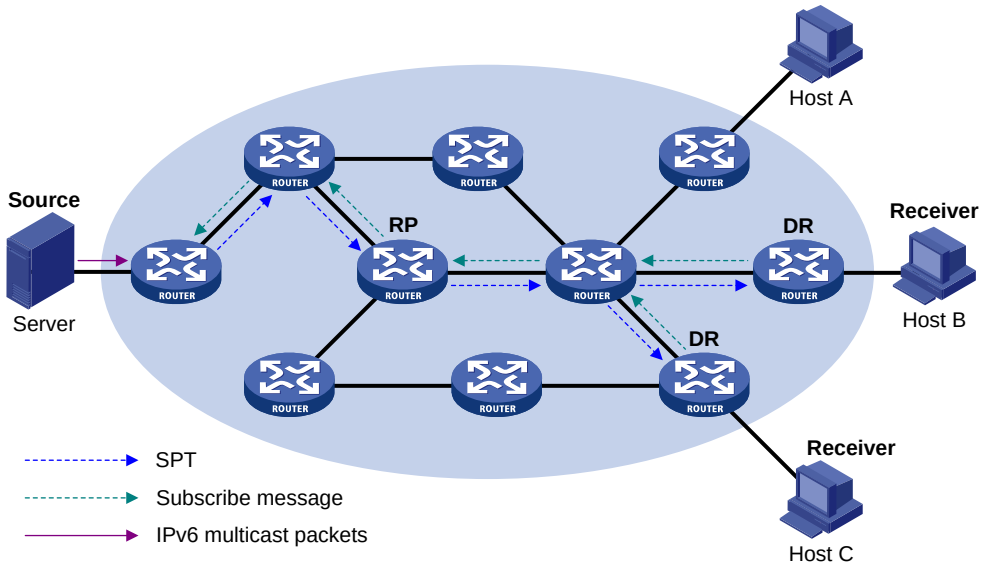
The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through MLDv2.

In actual applications, part of MLDv2 and IPv6 PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located an IPv6 multicast source, no RP or RPT is required. No source registration process is required for discovering IPv6 multicast sources in other IPv6 PIM domains.

IPv6 PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery

IPv6 PIM-SSM uses the same neighbor discovery mechanism as IPv6 PIM-SM. For more information, see "Neighbor discovery."



DR election

IPv6 PIM-SSM uses the same DR election mechanism as IPv6 PIM-SM. For more information, see "DR election."

SPT building

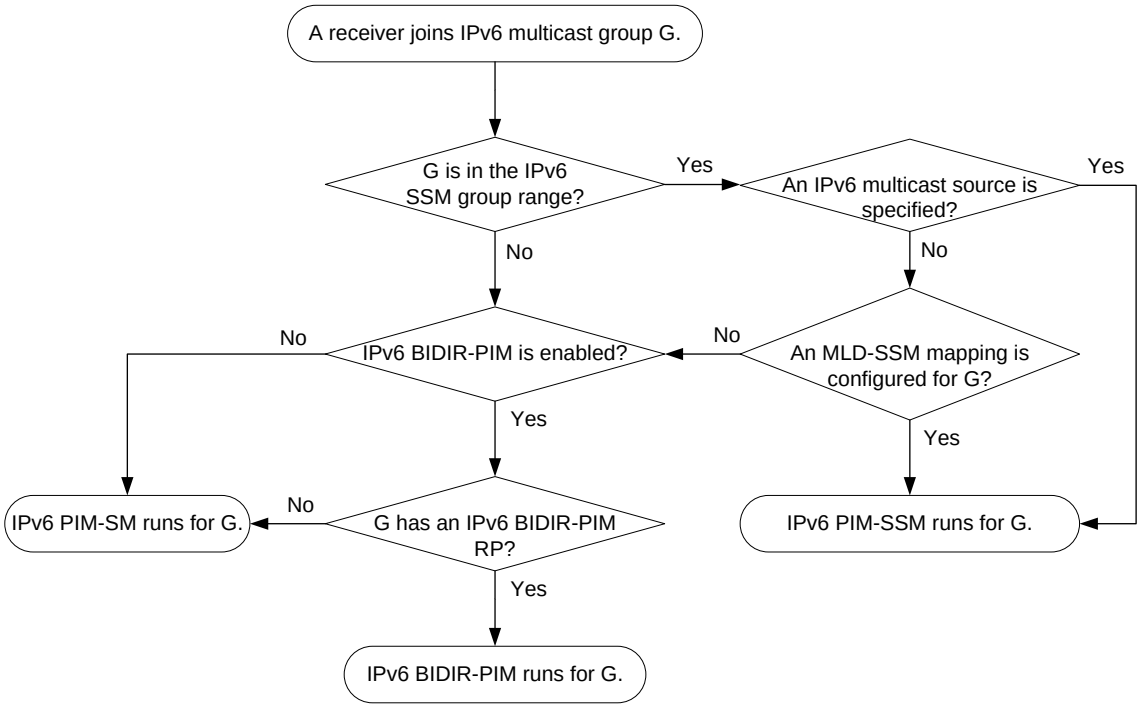
The decision to build an RPT for IPv6 PIM-SM or an SPT for IPv6 PIM-SSM depends on whether the IPv6 multicast group that the receiver host joins is in the IPv6 SSM group range. The IPv6 SSM group range reserved by IANA is FF3x::/32, where "x" represents any legal address scope.

Figure 11 SPT building in IPv6 PIM-SSM

As shown in Figure 11, Host B and Host C are receivers. They send MLDv2 report messages to their DRs to express their interest in the multicast information that the IPv6 multicast source S sends to the IPv6 multicast group G.

After receiving a report message, the DR first checks whether the group address in the message is in the IPv6 SSM group range and does the following:

- If the group address is in the IPv6 SSM group range, the DR sends a subscribe message hop by hop toward the IPv6 multicast source S. All devices along the path from the DR to the IPv6 multicast source create an (S, G) entry to build an SPT. The SPT is rooted the IPv6 multicast source S and has the receivers as its leaves. This SPT is the transmission channel in IPv6 PIM-SSM.
- If the group address is not in the IPv6 SSM group range, the receiver-side DR sends a (*, G) join message to the RP. The IPv6 multicast source registers with the source-side DR.



In IPv6 PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among IPv6 PIM protocols

In an IPv6 PIM network, IPv6 PIM-DM cannot run together with IPv6 PIM-SM, IPv6 BIDIR-PIM, or IPv6 PIM-SSM. However, IPv6 PIM-SM, IPv6 BIDIR-PIM, and IPv6 PIM-SSM can run together. (IPv6 BIDIR-PIM is not supported in the current software version.) Figure 12 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about MLD SSM mapping, see "Configuring MLD."

Figure 12 Relationship among IPv6 PIM protocols

IPv6 PIM support for VPNs

To support IPv6 PIM for VPNs, a multicast device that runs IPv6 PIM maintains an independent set of IPv6 PIM neighbor table, IPv6 multicast routing table, BSR information, and RP-set information for each VPN.

After receiving an IPv6 multicast data packet, the multicast device checks which VPN the IPv6 data packet belongs to. Then, the device forwards the IPv6 packet according to the IPv6 multicast routing table for that VPN or creates an IPv6 multicast routing entry for that VPN.

Configuring IPv6 PIM

Restrictions: Hardware compatibility with IPv6 PIM

Only the S5136S-EI switch series supports IPv6 PIM.

Restrictions and guidelines: IPv6 PIM configuration

All the interfaces on a device must operate in the same IPv6 PIM mode on the public network or the same VPN instance.

Configuring IPv6 PIM-DM

IPv6 PIM-DM tasks at a glance

To configure IPv6 PIM-DM, perform the following tasks:

1. Enabling IPv6 PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the IPv6 PIM-DM graft retry timer
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-DM

Before you configure IPv6 PIM-DM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-DM

About this task

With IPv6 PIM-DM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-DM on all non-border interfaces of devices when you deploy an IPv6 PIM-DM domain.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable IPv6 multicast routing and enter IPv6 MRIB view.

ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

By default, IPv6 multicast routing is disabled.

For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable IPv6 PIM-DM.

   ipv6 pim dm

   By default, IPv6 PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the IPv6 PIM device that is directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. Use this feature to prevent the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can adjust the amount of time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own IPv6 PIM-DM state, and resets the waiting timer.
- **Hop limit value of state refresh messages**—The hop limit value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the hop limit comes down to 0. A state refresh message with a large hop limit value might cycle on a small network. To control the propagation scope of state refresh messages, configure an appropriate hop limit value based on the network size on the device directly connected with the IPv6 multicast source.

Restrictions and guidelines

Perform this task on all devices in the IPv6 PIM-DM domain.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the state refresh feature.

   ipv6 pim state-refresh-capable

   By default, the state refresh feature is enabled.

4. Return to system view.

   quit

5. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

6. Set the state refresh interval.

state-refresh-interval *interval*

The default setting is 60 seconds.

7. Set the amount of time that the device must wait to accept a new state refresh message.

   state-refresh-rate-limit *time*

   The default setting is 30 seconds.

8. Set the hop limit value of state refresh messages.

   state-refresh-hoplimit *hoplimit-value*

   The default setting is 255.

Setting the IPv6 PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the IPv6 PIM-DM graft retry timer.

   ipv6 pim timer graft-retry *interval*

   By default, the IPv6 PIM-DM graft retry timer is 3 seconds.

Configuring IPv6 PIM-SM

IPv6 PIM-SM tasks at a glance

To configure IPv6 PIM-SM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. Configuring static RPs

   As a best practice, configure a static RP when only one dynamic RP exists in the network.

3. Configure dynamic RP election:
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring an IPv6 PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple IPv6 PIM devices exist in the network.

4. Enabling embedded RP

   Enable embedded RP on each device for inter-domain communication when the devices are located in different IPv6 PIM-SM domains.

5. (Optional.) Configuring Anycast RP

6. (Optional.) Configuring IPv6 multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SM

Before you configure IPv6 PIM-SM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-SM

About this task

With IPv6 PIM-SM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SM domain.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.
   ipv6 pim sm
   By default, IPv6 PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In the IPv6 PIM-SM domain, you can configure the same static RP for multiple IPv6 multicast groups by using the same RP address but different ACLs.

You do not need to enable IPv6 PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for an IPv6 multicast group, only the static RP with the highest IPv6 address takes effect.

The static RP configuration must be the same on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for IPv6 PIM-SM.

   static-rp *ipv6-rp-address* [{ *ipv6-acl-number* | **name** *ipv6-acl-name* }] | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the IPv6 PIM-SM domain because every C-BSR might become the BSR.

The device might use the BSR RP hash algorithm described in RFC 4601 or in RFC 2362 to calculate the RP for a multicast group. To ensure consistent group-to-RP mappings on all PIM devices in the IPv6 PIM-SM domain, specify the same BSR RP hash algorithm on the devices.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv6-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

5. (Optional.) Configure the device to use the BSR RP hash algorithm described in RFC 2362.

   bsr-rp-mapping rfc2362

By default, the device uses the BSR RP hash algorithm described in RFC 4601.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between the C-BSR and other devices.

The C-BSR configuration on the devices in the IPv6 PIM-SM domain must be the same.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure a C-BSR.
   c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *
4. (Optional.) Configure a BSR policy.
   bsr-policy *ipv6-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits for BSMs from the BSR for 130 seconds before sending BSMs.

Configuring an IPv6 PIM domain border

About this task

An IPv6 PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of IPv6 PIM domain border interfaces partition a network into different IPv6 PIM-SM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Configure an IPv6 PIM domain border.

   ipv6 pim bsr-boundary

   By default, an interface is not an IPv6 PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the IPv6 PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated IPv6 multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Enabling embedded RP

Restrictions and guidelines

This feature is supported only for IPv6 multicast group addresses in the range of FF7x::/12 or FFFx::/12 and in compliance with RFC 3956.

Enable this feature on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim[**vpn-instance** *vpn-instance-name*]
3. Enable embedded RP.
   embedded-rp [*ipv6-acl-number*]
   By default, embedded RP is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IPv6 address. The IPv6 address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IPv6 address of a loopback interface as the RP member address.

If you configure IPv6 addresses of multiple interfaces on the same device as RP member addresses, the lowest IPv6 address takes effect. The rest of the interface addresses become backup RP member addresses.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RPs or C-RPs in the IPv6 PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *ipv6-anycast-rp-address ipv6-member-address*
   You can repeat this command to add multiple RP member addresses to an Anycast RP set.

Configuring IPv6 multicast source registration

About this task

- **IPv6 PIM register policy**—An IPv6 PIM register policy enables an RP to filter register messages by using an ACL that specifies the IPv6 multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time**—The source-side DR stops sending register messages encapsulated with IPv6 multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated IPv6 multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. If the DR does not receive a register-stop message when the register probe timer expires, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is (5 seconds). You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure an IPv6 PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 PIM register policy.

   register-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 register policy is configured. All IPv6 register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate IPv6 multicast data in register messages destined to the RP. As a best practice to avoid IPv6 multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the switchover to SPT.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv6-acl-number*]

   By default, the first IPv6 multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   ipv6 pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring IPv6 PIM-SSM

IPv6 PIM-SSM tasks at a glance

To configure IPv6 PIM-SSM, perform the following tasks:

1. Enabling IPv6 PIM-SM

2. (Optional.) Specifying the IPv6 SSM group range
3. (Optional.) Configuring the delay time for DR election
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SSM

Before you configure IPv6 PIM-SSM, you must complete the following tasks:

- Configure an IPv6 unicast IPv6 routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 PIM-SM.
- Enable MLDv2 on the IPv6 PIM devices that connect to IPv6 multicast receivers.

Enabling IPv6 PIM-SM

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SSM domain.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.
   ipv6 pim sm
   By default, IPv6 PIM-SM is disabled.

Specifying the IPv6 SSM group range

About this task

When an IPv6 PIM-SM enabled interface receives an IPv6 multicast packet, it checks whether the IPv6 multicast group address of the packet is in the IPv6 SSM group range. If the IPv6 multicast group address is in this range, the IPv6 PIM mode for this packet is IPv6 PIM-SSM. If the IPv6 multicast group address is not in this range, the IPv6 PIM mode is IPv6 PIM-SM.

Restrictions and guidelines

Configure the same IPv6 SSM group range on all devices in the entire IPv6 PIM-SM domain. Otherwise, IPv6 multicast information cannot be delivered through the IPv6 SSM model.

When a member of an IPv6 multicast group in the IPv6 SSM group range sends an MLDv1 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the IPv6 SSM group range.
   ssm-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   The default range is FF3x::/32, where x can be any valid scope.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the delay time for DR election.
   ipv6 pim timer dr-elect-delay *delay-time*
   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common IPv6 PIM features

Common IPv6 PIM feature tasks at a glance

All the following tasks are optional.

- Configuring an IPv6 multicast source policy
- Configuring an IPv6 PIM hello policy
- Configuring IPv6 PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common IPv6 PIM timers

- Setting the maximum size of a join or prune message
- Configuring an IPv6 PIM join policy
- Setting the DSCP value for outgoing IPv6 PIM protocol packets
- Enabling BFD for IPv6 PIM
- Enabling IPv6 PIM passive mode
- Enabling IPv6 PIM NSR
- Enabling SNMP notifications for IPv6 PIM
- Enabling IPv6 PIM logging
- Enabling log message suppression for IPv6 PIM

Configuring an IPv6 multicast source policy

About this task

This feature enables the device to filter IPv6 multicast data by using an ACL that specifies the IPv6 multicast sources and the optional groups. It filters not only IPv6 multicast data packets but also IPv6 PIM register messages with IPv6 multicast data encapsulated. This also reduces the IPv6 multicast traffic on the network.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 multicast source policy.

   source-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 multicast source policy is configured. The device does not filter IPv6 multicast data packets.

Configuring an IPv6 PIM hello policy

About this task

This feature enables the device to filter IPv6 PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against IPv6 PIM message attacks and to establish correct IPv6 PIM neighboring relationships.

If hello messages of an existing IPv6 PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure an IPv6 PIM hello policy.

   ipv6 pim neighbor-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 PIM hello policy is configured on an interface. All IPv6 PIM hello messages are regarded as legal.

Configuring IPv6 PIM hello message options

About this task

In either an IPv6 PIM-DM domain or an IPv6 PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for IPv6 PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the IPv6 multicast source or the receivers.
- **Holdtime**—IPv6 PIM neighbor lifetime. If a device receives no hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the IPv6 PIM message propagation delay. The override interval defines a time period for a downstream device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different IPv6 PIM devices on a shared-media LAN is different, the largest ones apply.

If you enable neighbor tracking, you must enable it on all IPv6 PIM devices on a shared-media LAN or the upstream device to track join messages from every downstream device.

You can configure hello message options for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

Configuring hello message options globally

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.

   hello-option dr-priority *priority*

   The default setting is 1.
4. Set the neighbor lifetime.

   hello-option holdtime *time*

   The default setting is 105 seconds.
5. Set the IPv6 PIM message propagation delay for a shared-media LAN.

hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the DR priority.

   ipv6 pim hello-option dr-priority *priority*

   The default setting is 1.

4. Set the neighbor lifetime.

   ipv6 pim hello-option holdtime *time*

   The default setting is 105 seconds.

5. Set the IPv6 PIM message propagation delay.

   ipv6 pim hello-option lan-delay *delay*

   The default setting is 500 milliseconds.

6. Set the override interval.

   ipv6 pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   ipv6 pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with IPv6 PIM. The generation ID is a random value, but it changes only when the status of the device changes. If an IPv6 PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

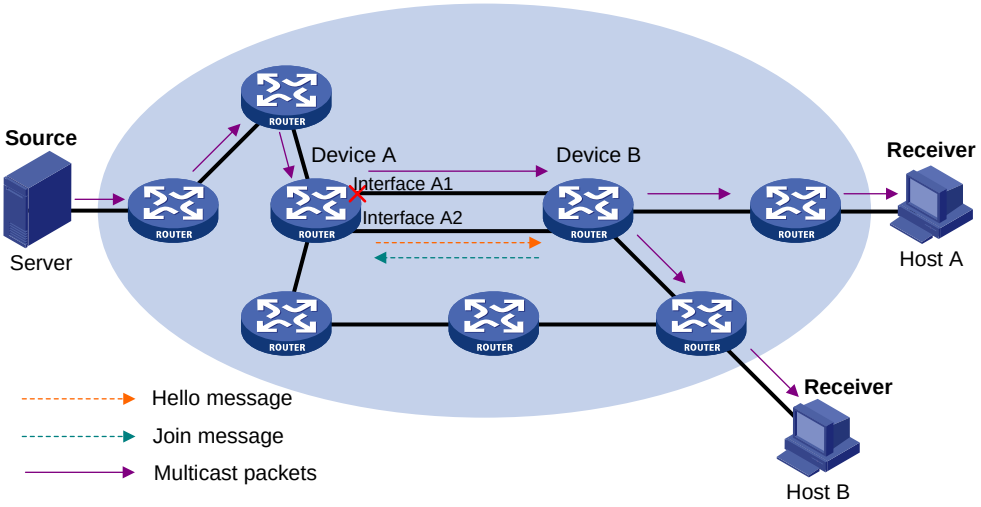
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

ipv6 pim require-genid

By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 13, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send an IPv6 PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 13 Network diagram

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to send hello messages with a different Generation ID upon a port state change.

   ipv6 pim triggered-hello enable { **port-down** | **port-up** } *

   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common IPv6 PIM timers

About this task

The following are common IPv6 PIM timers:

- **Hello interval**—Interval at which an IPv6 PIM device sends hello messages to discover IPv6 PIM neighbors and maintain IPv6 PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, an IPv6 PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join or prune interval**—Interval at which an IPv6 PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which an IPv6 PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is contained in a join or prune message.
- **IPv6 multicast source lifetime**—Lifetime that an IPv6 PIM device maintains for an IPv6 multicast source. If a device does not receive subsequent IPv6 multicast data from the IPv6 multicast source S when the timer expires, it deletes the (S, G) entry for the IPv6 multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common IPv6 PIM timers for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common IPv6 PIM timers globally

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the hello interval.

   timer hello *interval*

   By default, the interval to send hello messages is 30 seconds.

4. Set the join or prune interval.

   timer join-prune *interval*

   By default, the interval to send join or prune messages is 60 seconds.

   This configuration takes effect after the current interval ends.

5. Set the joined/pruned state holdtime.

   holdtime join-prune *time*

   By default, the joined/pruned state holdtime timer is 210 seconds.

6. Set the IPv6 multicast source lifetime.

   source-lifetime *time*

   By default, the IPv6 multicast source lifetime is 210 seconds.

Configuring common IPv6 PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   ipv6 pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   ipv6 pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   ipv6 pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   ipv6 pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

Restrictions and guidelines

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum size of a join or prune message.
   jp-pkt-size *size*
   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring an IPv6 PIM join policy

About this task

The IPv6 PIM join policy filters joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages to protect the device against invalid IPv6 PIM join or prune message attacks. The policy identifies valid joined IPv6 multicast source and groups in IPv6 PIM join or prune messages and filters out invalid joined IPv6 multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined IPv6 multicast sources and groups.

Procedure

1. Enter system view.
   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 PIM join policy to filter joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages.

   ipv6 pim join-policy { { *ipv6-acl-number* | **name** *ipv6-acl-name* } | [**asm** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **ssm** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] * }

   By default, no IPv6 PIM join policy is configured and joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing IPv6 PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing IPv6 PIM protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IPv6 PIM protocol packets.

Enabling BFD for IPv6 PIM

About this task

If a DR on a shared-media network fails, a new DR election process will start after the DR ages out. However, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, you can enable BFD for IPv6 PIM to detect link failures among IPv6 PIM neighbors.

You must enable BFD for IPv6 PIM on all IPv6 PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

You must enable IPv6 PIM-DM or IPv6 PIM-SM on an interface before you configure this feature on the interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for IPv6 PIM.

   ipv6 pim bfd enable

   By default, BFD is disabled for IPv6 PIM.

Enabling IPv6 PIM passive mode

About this task

To guard against IPv6 PIM hello spoofing, you can enable IPv6 PIM passive mode on a receiver-side interface. The interface cannot receive or forward IPv6 PIM protocol messages (excluding register, register-stop and C-RP-Adv messages), and acts as the DR on the subnet. In IPv6 BIDIR-PIM, it also acts as the DF.

Restrictions and guidelines

This feature takes effect only when IPv6 PIM-DM or IPv6 PIM-SM is enabled on the interface.

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple IPv6 PIM devices.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface i*nterface-type interface-number*
3. Enable IPv6 PIM passive mode on the interface.
   ipv6 pim passive
   By default, IPv6 PIM passive mode is disabled on an interface.

Enabling IPv6 PIM NSR

About this task

This feature enables IPv6 PIM to back up protocol state information, including IPv6 PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for IPv6 PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 PIM NSR.
   ipv6 pim non-stop-routing
   By default, IPv6 PIM NSR is disabled.

Enabling SNMP notifications for IPv6 PIM

About this task

To report critical IPv6 PIM events to an NMS, enable SNMP notifications for IPv6 PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IPv6 PIM.

snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **invalid-join-prune** | **invalid-register** | **interface-election** | **neighbor-loss** | **private-interface-election** | **private-neighbor-loss** | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

By default, SNMP notifications for IPv6 PIM are enabled.

Enabling IPv6 PIM logging

About this task

To report critical IPv6 PIM events to the information center, enable IPv6 PIM logging. For IPv6 PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IPv6 PIM logging or use the **ipv6 pim log suppress** command to enable log message suppression for IPv6 PIM.

Procedure

1. Enter system view.

   system-view
2. Enable IPv6 PIM logging.

   ipv6 pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *

   IPv6 PIM logging is enabled by default.

Enabling log message suppression for IPv6 PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IPv6 PIM. With this feature configured, the speed of sending IPv6 PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IPv6 PIM logging has been enabled using the **ipv6 pim log enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable log message suppression for IPv6 PIM.

   ipv6 pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *

   By default, log message suppression is enabled for IPv6 PIM.

Display and maintenance commands for IPv6 PIM

Execute **display** commands in any view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description**| **down**]]
Display BSR information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by IPv6 PIM.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*ipv6-source-address*]
Display C-RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display IPv6 PIM information on an interface.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]
Display IPv6 PIM neighbor information.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*ipv6-neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display IPv6 PIM routing entries.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *
Display RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **rp-info** [*ipv6-group-address*]
Display statistics for IPv6 PIM packets.	**display ipv6 pim statistics**

IPv6 PIM configuration examples

Example: Configuring IPv6 PIM-DM

Network configuration

As shown in Figure 14:

- OSPFv3 runs on the network.

- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain is operating in the dense mode.
- Host A and Host C are multicast receivers in two stub networks N1 and N2.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 14 Network diagram

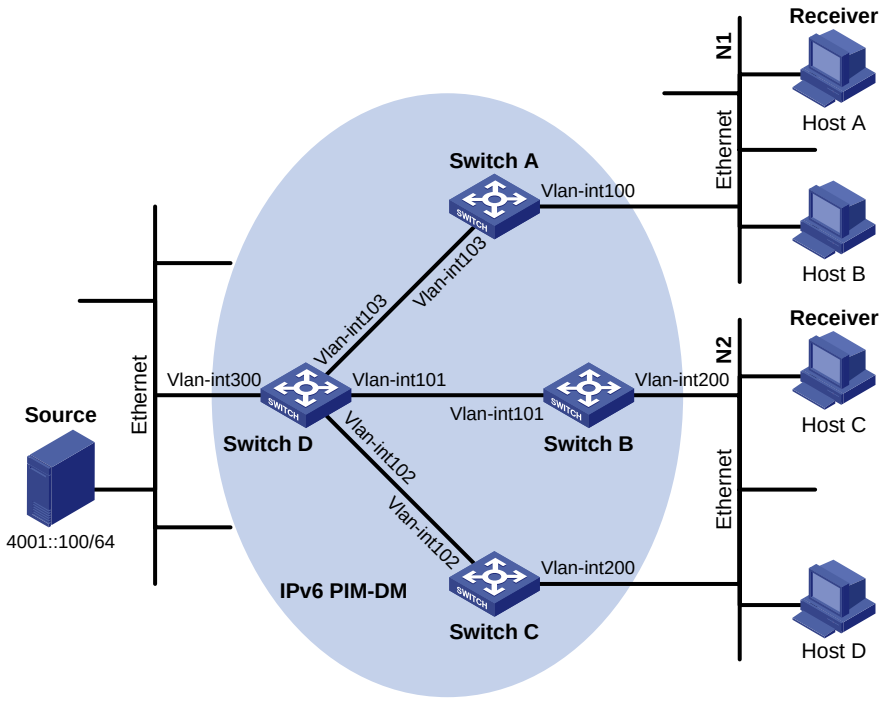


Table 2 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int103	1002::1/64	Switch D	Vlan-int103	1002::2/64
Switch B	Vlan-int200	2001::1/64	Switch D	Vlan-int101	2002::2/64
Switch B	Vlan-int101	2002::1/64	Switch D	Vlan-int102	3001::2/64
Switch C	Vlan-int200	2001::2/64	Switch D	Vlan-int300	4001::1/64
Switch C	Vlan-int102	3001::1/64	Switch D	Vlan-int103	1002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 14, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IPv6 multicast routing, and enable IPv6 PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] ipv6 pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] ipv6 pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] ipv6 pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display IPv6 PIM information on Switch D.

```
[SwitchD] display ipv6 pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:1    (local)
 Interface: Vlan103
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2    (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3    (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:4    (local)
```

Display IPv6 PIM neighboring relationship on Switch D.

```
[SwitchD] display ipv6 pim neighbor
 Total IPv6 pim neighbors: 3
  Neighbor: FE80::A01:101:1
    Interface: Vlan103
    Uptime: 00:04:00
    Expiry time: 00:01:29
    DR priority: 1
    Mode: N/A
  Neighbor: FE80::B01:102:2
    Interface: Vlan101
    Uptime: 00:04:16
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: FE80::C01:103:3
    Interface: Vlan102
    Uptime: 00:03:54
    Expiry time: 00:01:17
    DR priority: 5
    Mode: N/A
```

Send an MLD report from Host A to join IPv6 multicast group FF0E::101. (Details not shown.)

Send IPv6 multicast data from IPv6 multicast source 4001::100/64 to IPv6 multicast group FF0E::101. (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, FF0E::101)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:01:24
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:01:20, Expires: -

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:01:20
     Upstream interface: Vlan-interface103
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
```

```
            Protocol: pim-dm, UpTime: 00:01:20, Expires: -
```

Display IPv6 PIM multicast routing table information on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: LOC ACT
     UpTime: 00:02:19
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 2
         1: Vlan-interface103
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
         2: Vlan-interface102
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has a correct (*, G) entry.

Example: Configuring non-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 15:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist in each stub network. The entire IPv6 PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers in the stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to the IPv6 multicast group range FF0E::101/64. Specify VLAN-interface101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 15 Network diagram

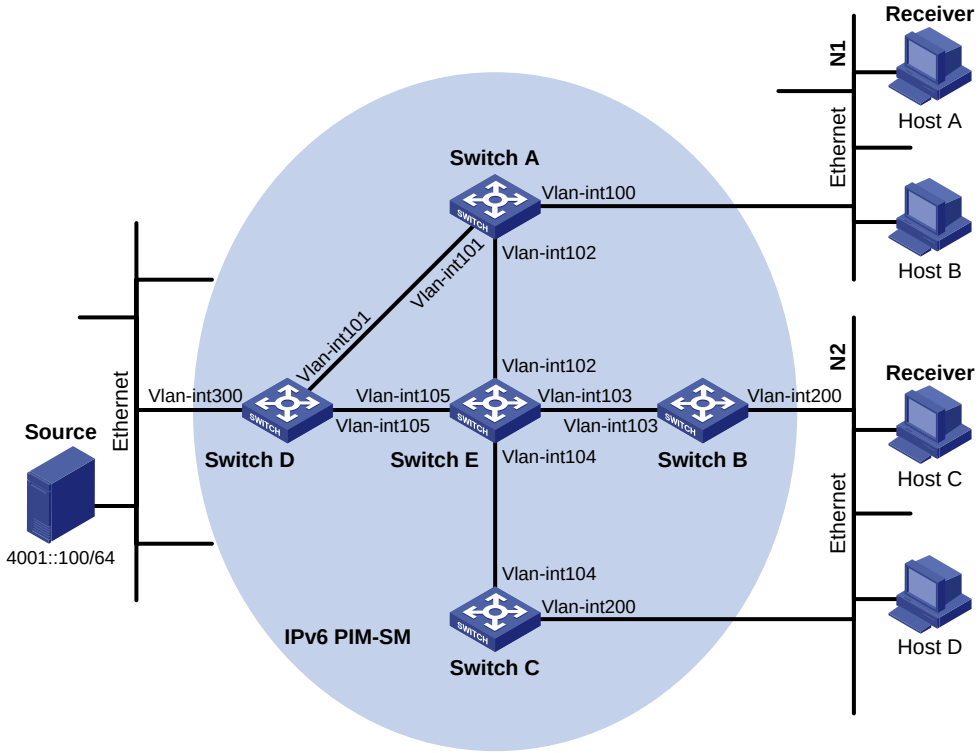

Table 3 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 15, and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and static RPs:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl ipv6 basic 2005
[SwitchE-acl-ipv6-basic-2005] rule permit source ff0e::101 64
[SwitchE-acl-ipv6-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP, and configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE] ipv6 pim
[SwitchE-pim6] c-bsr 1003::2
[SwitchE-pim6] c-rp 1003::2 group-policy 2005
[SwitchE-pim6] static-rp 1002::2
[SwitchE-pim6] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as a static RP.

```
[SwitchA] ipv6 pim
[SwitchA-pim6] static-rp 1002::2
[SwitchA-pim6] quit
```

Configure a static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3
```

Display BSR information on Switch A.

```
[SwitchA] display ipv6 pim bsr-info
 Scope: non-scoped
```

```
    State: Accept Preferred
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display ipv6 pim bsr-info
 Scope: non-scoped
    State: Elected
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
    Candidate BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
```

Display RP information on Switch A.

```
[SwitchA] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF0E::101/64
       RP address                Priority  HoldTime  Uptime    Expires
       1003::2                   192       180       00:05:19  00:02:11

Static RP information:
       RP address                ACL   Mode    Preferred
       1002::2                   ----  pim-sm  No
```

Example: Configuring admin-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 16:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The entire IPv6 PIM-SM domain is divided into IPv6 admin-scoped zone 1, IPv6 admin-scoped zone 2, and the IPv6 global-scoped zone. Switch B, Switch C, and Switch D are ZBRs of the three zones, respectively.
- Source 1 and Source 2 send different IPv6 multicast data to the IPv6 multicast group FF14::101. Host A receives the IPv6 multicast data only from Source 1, and Host B receives the IPv6 multicast data only from Source 2. Source 3 sends IPv6 multicast data to the IPv6 multicast group FF1E::202. Host C is an IPv6 multicast receiver for the IPv6 multicast group FF1E::202.
- VLAN-interface 101 of Switch B acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 1, and VLAN-interface 105 of Switch D acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 2. Both of the two interfaces are designated to the IPv6 multicast groups with the scope field value of 4. VLAN-interface 109 of Switch F acts as a C-BSR and a C-RP for the IPv6 global-scoped zone, and it is designated to the IPv6 multicast groups with the scope field value of 14.

- MLDv1 runs between Switch A, Switch E, Switch I, and the receivers that directly connect to them, respectively.

Figure 16 Network diagram

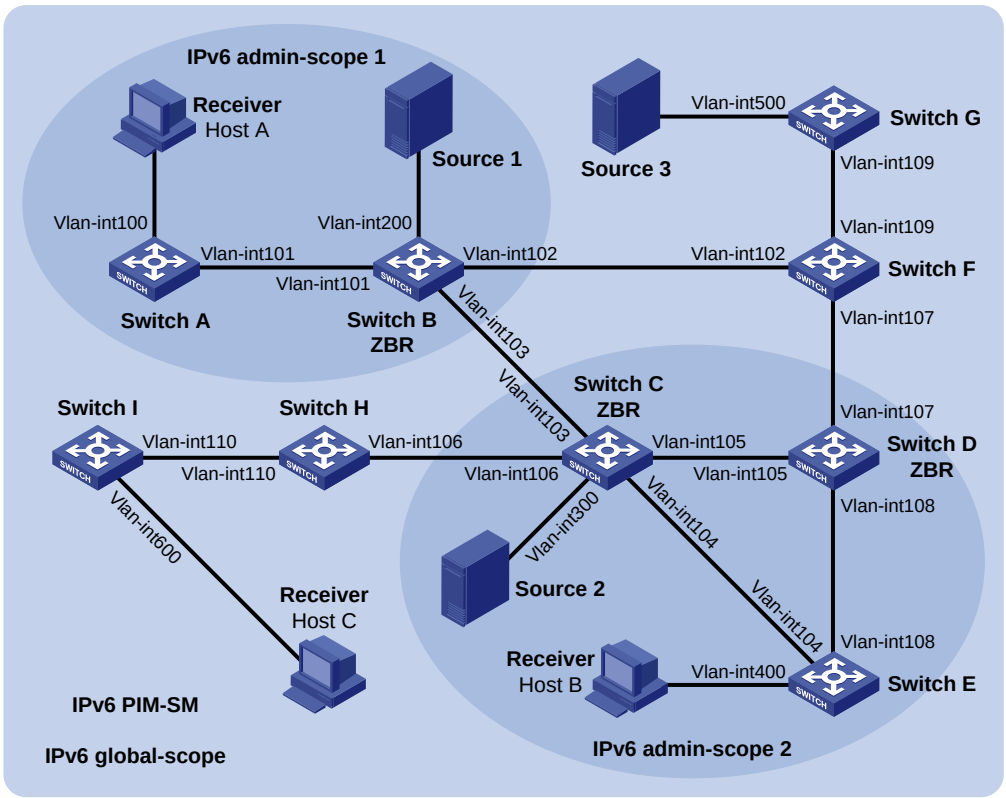

Table 4 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch E	Vlan-int104	3002::2/64
Switch A	Vlan-int101	1002::1/64	Switch E	Vlan-int108	6001::2/64
Switch B	Vlan-int200	2001::1/64	Switch F	Vlan-int109	8001::1/64
Switch B	Vlan-int101	1002::2/64	Switch F	Vlan-int107	6002::2/64
Switch B	Vlan-int103	2002::1/64	Switch F	Vlan-int102	2003::2/64
Switch B	Vlan-int102	2003::1/64	Switch G	Vlan-int500	9001::1/64
Switch C	Vlan-int300	3001::1/64	Switch G	Vlan-int109	8001::2/64
Switch C	Vlan-int104	3002::1/64	Switch H	Vlan-int110	4001::1/64
Switch C	Vlan-int105	3003::1/64	Switch H	Vlan-int106	3004::2/64
Switch C	Vlan-int103	2002::2/64	Switch I	Vlan-int600	5001::1/64
Switch C	Vlan-int106	3004::1/64	Switch I	Vlan-int110	4001::2/64
Switch D	Vlan-int105	3003::2/64	Source 1	—	2001::100/64
Switch D	Vlan-int108	6001::1/64	Source 2	—	3001::100/64
Switch D	Vlan-int107	6002::1/64	Source 3	—	9001::100/64
Switch E	Vlan-int400	7001::1/64			

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 16., and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable MLD on the receiver-side interface (VLAN-interface 100).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on VLAN-interface 101.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch E and Switch I in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IPv6 multicast routing, and enable IPv6 PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] ipv6 multicast routing
[SwitchB-mrib6] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ipv6 pim sm
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] ipv6 pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] ipv6 pim sm
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] ipv6 pim sm
[SwitchB-Vlan-interface103] quit
```

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch C, Switch D, Switch F, Switch G, and Switch H in the same way Switch B is configured. (Details not shown.)

2. Configure IPv6 admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 102 and VLAN-interface 103 as the boundaries of IPv6 admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] ipv6 multicast boundary scope 4
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] ipv6 multicast boundary scope 4
[SwitchB-Vlan-interface103] quit
```

On Switch C, configure VLAN-interface 103 and VLAN-interface 106 as the boundaries of IPv6 admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface103] quit
[SwitchC] interface vlan-interface 106
[SwitchC-Vlan-interface106] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface106] quit
```

On Switch D, configure VLAN-interface 107 as the boundary of IPv6 admin-scoped zone 2.

```
<SwitchD> system-view
[SwitchD] interface vlan-interface 107
[SwitchD-Vlan-interface107] ipv6 multicast boundary scope 4
[SwitchD-Vlan-interface107] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure VLAN-interface 101 as a C-BSR and a C-RP for IPv6 admin-scoped zone 1.

```
[SwitchB] ipv6 pim
[SwitchB-pim6] c-bsr 1002::2 scope 4
[SwitchB-pim6] c-rp 1002::2 scope 4
[SwitchB-pim6] quit
```

On Switch D, configure VLAN-interface 105 as a C-BSR and a C-RP for IPv6 admin-scoped zone 2.

```
[SwitchD] ipv6 pim
[SwitchD-pim6] c-bsr 3003::2 scope 4
[SwitchD-pim6] c-rp 3003::2 scope 4
[SwitchD-pim6] quit
```

On Switch F, configure VLAN-interface 109 as a C-BSR and a C-RP for the IPv6 global-scoped zone.

```
<SwitchF> system-view
[SwitchF] ipv6 pim
[SwitchF-pim6] c-bsr 8001::1
[SwitchF-pim6] c-rp 8001::1
[SwitchF-pim6] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:25
     Elected BSR address: 8001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45

 Scope: 4
     State: Elected
     Bootstrap timer: 00:00:06
     Elected BSR address: 1002::2
       Priority: 64
```

```
      Hash mask length: 126
      Uptime: 00:04:54
    Candidate BSR address: 1002::2
      Priority: 64
      Hash mask length: 126
```

Display BSR information on Switch D.

```
[SwitchD] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:25
     Elected BSR address: 8001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45

 Scope: 4
     State: Elected
     Bootstrap timer: 00:01:25
     Elected BSR address: 3003::2
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45
     Candidate BSR address: 3003::2
       Priority: 64
       Hash mask length: 126
```

Display BSR information on Switch F.

```
[SwitchF] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:00:49
     Elected BSR address: 8001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:11
     Candidate BSR address: 8001::1
       Priority: 64
       Hash mask length: 126
```

Display RP information on Switch B.

```
[SwitchB] display ipv6 pim rp-info
 BSR RP information:
 Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address               Priority  HoldTime  Uptime    Expires

Group/MaskLen: FFF4::/16
  RP address                Priority  HoldTime  Uptime    Expires
  1002::2 (local)           192       180       00:02:03  00:02:56
Group/MaskLen: FF04::/16
  RP address                Priority  HoldTime  Uptime    Expires
  1002::2 (local)           192       180       00:02:03  00:02:56
```

Display RP information on Switch F.

```
[SwitchF] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address                Priority  HoldTime  Uptime    Expires
       8001::1 (local)           192       180       00:10:28  00:02:31
```

Example: Configuring IPv6 PIM-SSM

Network configuration

As shown in Figure 17:

- OSPFv3 runs on the network.
- Receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain operates in the SSM mode.
- Host A and Host C are IPv6 multicast receivers on two stub networks N1 and N2.
- The SSM group range is FF3E::/64.
- MLDv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 17 Network diagram

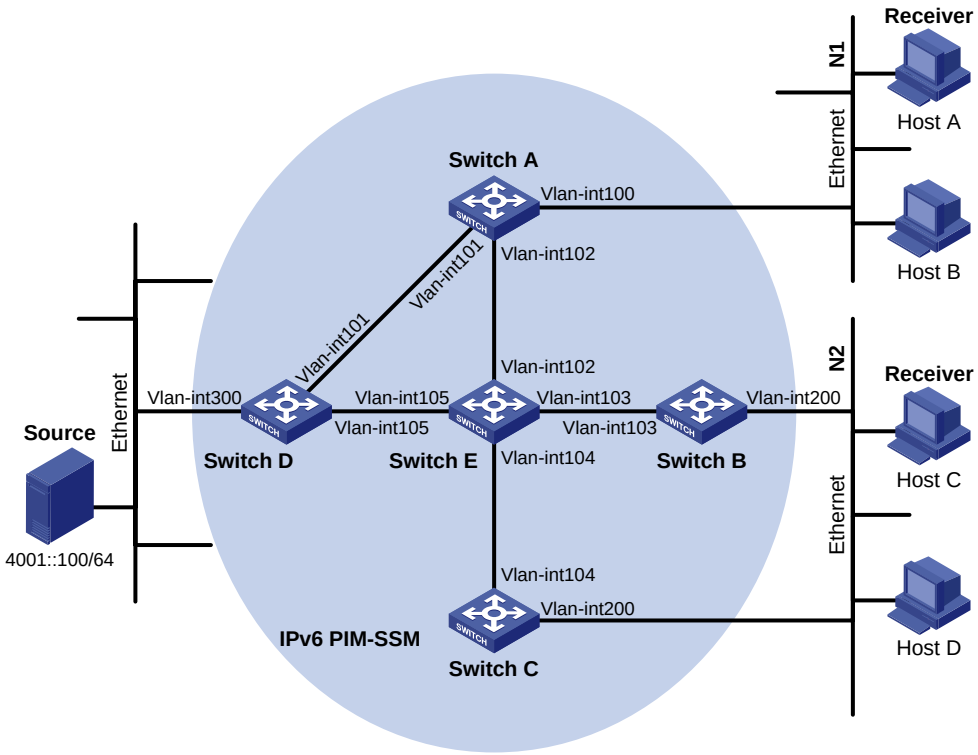

Table 5 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 17, and configure OSPFv3 on the switches in the IPv6 PIM-SSM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLDv2 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] mld version 2
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] ipv6 pim sm
   [SwitchA-Vlan-interface102] quit
   ```

   # Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

   # Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range FF3E::/64 on Switch A.

   ```
   [SwitchA] acl ipv6 basic 2000
   [SwitchA-acl-ipv6-basic-2000] rule permit source ff3e:: 64
   [SwitchA-acl-ipv6-basic-2000] quit
   [SwitchA] ipv6 pim
   [SwitchA-pim6] ssm-policy 2000
   [SwitchA-pim6] quit
   ```

3. Configure the IPv6 SSM group range on Switch B, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
```

```
  NbrCnt: 1
  HelloInt: 30
  DR priority: 1
  DR address: FE80::A01:201:2
 Interface: Vlan102
  NbrCnt: 1
  HelloInt: 30
  DR priority: 1
  DR address: FE80::A01:201:3
```

Send an MLDv2 report from Host A to join the IPv6 multicast source and group (4001::100/64, FF3E::101). (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:00:11
     Upstream interface: Vlan-interface101
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:00:11, Expires: 00:03:25
```

Display IPv6 PIM multicast routing table information on Switch B.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: LOC
     UpTime: 00:08:02
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface105
             Protocol: pim-ssm, UpTime: 00:08:02, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting IPv6 PIM

A multicast distribution tree cannot be correctly built

Symptom

No IPv6 multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in an IPv6 PIM network. This means that an IPv6 multicast distribution tree cannot be correctly built.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the IPv6 multicast source or the RP is available.
2. Use the **display ipv6 pim interface** command to verify IPv6 PIM information on each interface, especially on the RPF interface. If IPv6 PIM is not enabled on the interfaces, use **ipv6 pim dm** or **ipv6 pim sm** to command enable IPv6 PIM-DM or IPv6 PIM-SM for the interfaces.
3. Use the **display ipv6 pim neighbor** command to verify that the RPF neighbor is an IPv6 PIM neighbor.
4. Verify that IPv6 PIM and MLD are enabled on the interfaces that directly connect to the IPv6 multicast sources or the receivers.
5. Use the **display ipv6 pim interface verbose** command to verify that the same IPv6 PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same IPv6 PIM mode is enabled on all devices on the network. For IPv6 PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

IPv6 multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive IPv6 multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives IPv6 multicast data but does not create an (S, G) entry in the IPv6 PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IPv6 multicast forwarding boundary settings. Use the **ipv6 multicast boundary** command to change the multicast forwarding boundary settings to make the IPv6 multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the IPv6 multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the IPv6 multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in IPv6 PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the IPv6 multicast source.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the RP is available on each device.
2. Use the **display ipv6 pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display ipv6 pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or IPv6 multicast source registration fails in IPv6 PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no IPv6 unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the IPv6 multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command on each device to view routing table information. Verify that IPv6 unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display ipv6 pim bsr-info** command to verify that the BSR information exists on each device.
3. Use the **display ipv6 pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display ipv6 pim neighbor** command to verify that IPv6 PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

Preface

This configuration guide describes fundamentals and configuration of MCE.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring MCE

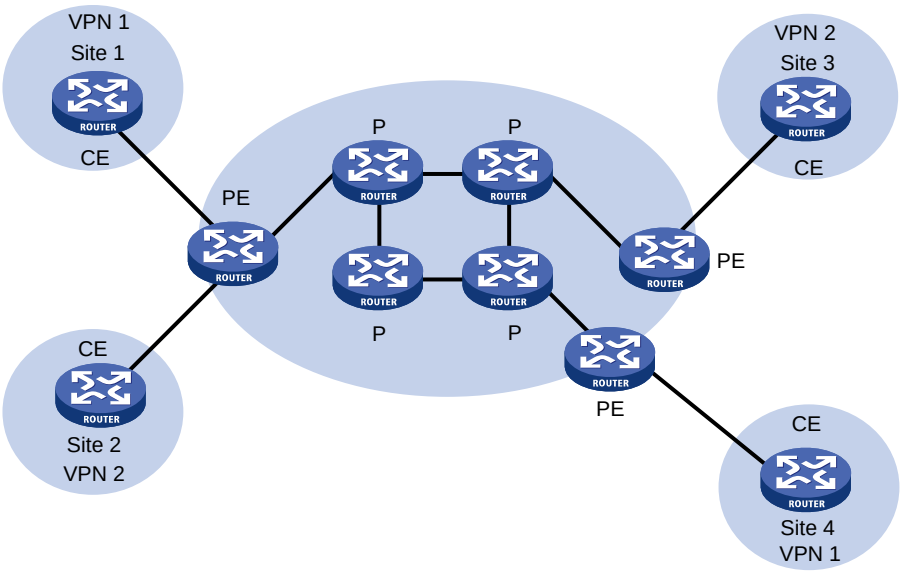
About MCE

The Multi-VPN Instance Customer Edge (MCE) feature allows multiple VPNs to share a CE with ensured data security in an MPLS L3VPN network. MCE provides traffic separation between VPNs by distinguishing routes of the VPNs.

MPLS L3VPN problems solved by MCE

MPLS L3VPN is a L3VPN technology used to interconnect geographically dispersed VPN sites. MPLS L3VPN uses BGP to advertise VPN routes and uses MPLS to forward VPN packets over a service provider backbone.

In conventional MPLS L3VPN, a VPN site must exclusively use a CE to connect a PE. With increasing business, a private network must be divided into multiple VPNs and the VPNs must be isolated from one another for data security. Using a CE exclusively for each VPN costs much in buying and maintaining the network devices. Using a common CE for multiple VPNs cannot ensure data security because the VPNs use the same routing table.



The MCE feature offers balance between cost and security. It creates multiple VPN instances on a CE to provide logically separated routing tables and address spaces for the VPNs, so the VPNs can share the CE. This CE is called the MCE device.

Basic MPLS L3VPN architecture

A basic MPLS L3VPN architecture has the following types of devices:

- **Customer edge device**—A CE device resides on a customer network and has one or more interfaces directly connected to a service provider network. It does not support MPLS.
- **Provider edge device**—A PE device resides at the edge of a service provider network and is connected to one or more CEs. All MPLS VPN services are processed on PEs.
- **Provider device**—A P device is a core device on a service provider network. It is not directly connected to any CEs. A P device has only basic MPLS forwarding capability and does not handle VPN routing information.

Figure 1 Basic MPLS L3VPN architecture

MCE-related MPLS L3VPN concepts

Site

A site has the following features:

- A site is a group of IP systems with IP connectivity that does not rely on any service provider networks.
- The classification of a site depends on the topology relationship of the devices, rather than the geographical positions. However, the devices at a site are, in most cases, adjacent to each other geographically.
- The devices at a site can belong to multiple VPNs, which means that a site can belong to multiple VPNs.
- A site is connected to a provider network through one or more CEs. A site can contain multiple CEs, but a CE can belong to only one site.

Sites connected to the same provider network can be classified into different sets by policies. Only the sites in the same set can access each other through the provider network. Such a set is called a VPN.

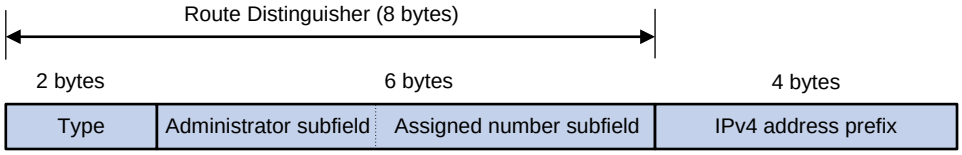
VPN instance

VPN instances implement route isolation, data independence, and data security for VPNs.

A VPN instance has the following components:

- A separate Label Forwarding Information Base (LFIB).
- An IP routing table.
- Interfaces bound to the VPN instance.
- VPN instance administration information, including route distinguishers (RDs), route targets (RTs), and route filtering policies.

To associate a site with a VPN instance, bind the VPN instance to the PE's interface connected to the site. A site can be associated with only one VPN instance, and different sites can be associated with the same VPN instance. A VPN instance contains the VPN membership and routing rules of associated sites.



VPN-IPv4 address

Each VPN independently manages its address space. The address spaces of VPNs might overlap. For example, if both VPN 1 and VPN 2 use the addresses on subnet 10.110.10.0/24, address space overlapping occurs.

Multiprotocol BGP (MP-BGP) can solve this problem by advertising VPN-IPv4 addresses (also called VPNv4 addresses).

As shown in Figure 2, a VPN-IPv4 address consists of 12 bytes. The first eight bytes represent the RD, followed by a four-byte IPv4 prefix. The RD and the IPv4 prefix form a unique VPN-IPv4 prefix.

Figure 2 VPN-IPv4 address structure

An RD can be in one of the following formats:

- When the Type field is 0, the Administrator subfield occupies two bytes, the Assigned number subfield occupies four bytes, and the RD format is *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- When the Type field is 1, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit IPv4 address*:*16-bit user-defined number*. For example, 172.1.1.1:1.
- When the Type field is 2, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the Administrator subfield to any private AS number or private IP address.

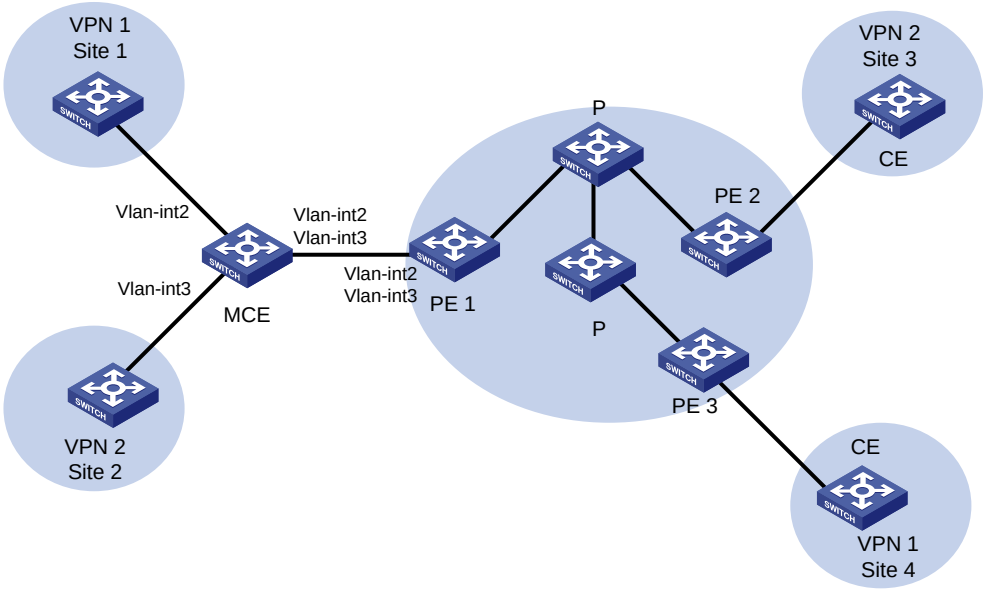
Route target attribute

MPLS L3VPN uses route target community attributes to control the advertisement of VPN routing information. A VPN instance on a PE supports the following types of route target attributes:

- **Export target attribute**—A PE sets the export target attribute for VPN-IPv4 routes learned from directly connected sites before advertising them to other PEs.
- **Import target attribute**—A PE checks the export target attribute of VPN-IPv4 routes received from other PEs. If the export target attribute matches the import target attribute of a VPN instance, the PE adds the routes to the routing table of the VPN instance.

Route target attributes define which sites can receive VPN-IPv4 routes, and from which sites a PE can receive routes.

Like RDs, route target attributes can be one of the following formats:



- *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- *32-bit IPv4 address:16-bit user-defined number*. For example, 172.1.1.1:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

MCE working mechanism

As shown in Figure 3, the MCE exchanges private routes with VPN sites and PE 1, and adds the private routes to the routing tables of corresponding VPN instances.

- **Route exchange between MCE and VPN site**—Create VPN instances VPN 1 and VPN 2 on the MCE. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE adds a received route to the routing table of the VPN instance that is bound to the receiving interface.
- **Route exchange between MCE and PE**—The MCE connects to PE 1 through trunk links. On PE 1, create VPN instances for VPN 1 and VPN 2. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE and PE add a received route to the routing table of the VPN instance that is bound to the receiving interface.

Figure 3 Network diagram for the MCE feature

You can configure static routes, RIP, and OSPF between an MCE and a VPN site and between an MCE and a PE.

NOTE:

To implement dynamic IP assignment for DHCP clients in private networks, you can configure DHCP server or DHCP relay agent on the MCE. When the MCE functions as the DHCP server, the IP addresses assigned to different private networks cannot overlap.

Restrictions and guidelines: MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

MCE tasks at a glance

To configure MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site

3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter VPN instance view.
   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for a VPN instance.
4. (Optional.) Configure a description for the VPN instance.
   description *text*
   By default, no description is configured for a VPN instance.
5. (Optional.) Configure a VPN ID for the VPN instance.
   vpn-id *vpn-id*
   By default, no VPN ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   This interface connects the device to the CE.
3. Associate a VPN instance with the interface.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:
Associating a VPN instance with an interface or disassociating a VPN instance from an interface will clear the IP address and routing protocol settings of the interface.

Configuration of this command deletes the IP address of the current interface. You must reconfigure an IP address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv4 address family view, IPv4 VPN uses the configuration in VPN instance IPv4 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter VPN instance view or VPN instance IPv4 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Execute the following commands in sequence to enter VPN instance IPv4 address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4
3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.
4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from learning too many routes.
5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.
6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through a static route. Static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding a static route to a VPN instance, so that the static routes of different VPN instances can be isolated from each other.

Perform this configuration on the MCE. On the VPN site, configure a common static route.

Procedure

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

3. (Optional.) Configure the default preference for static routes.

   ip route-static default-preference *default-preference*

   The default preference is 60.

Configuring RIP between an MCE and a VPN site

About this task

Binding RIP processes to VPN instances can isolate routes of different VPNs. For more information about RIP, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common RIP process.

Procedure

1. Enter system view.

   system-view

2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*

   A RIP process can belong to only one VPN instance.

3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.

4. Redistribute remote site routes advertised by the PE into RIP.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no route is redistributed into RIP.

Configuring OSPF between an MCE and a VPN site

About this task

Binding OSPF processes to VPN instances can isolate routes of different VPNs. For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common OSPF process.

Procedure

1. Enter system view.

   system-view

2. Create an OSPF process for a VPN instance and enter OSPF view.

ospf [*process-id*] **router-id** *router-id* **vpn-instance** *vpn-instance-name*

Keywords	Usage guidelines
router-id *router-id*	An OSPF process that is bound to a VPN instance does not use the public network router ID configured in system view. Therefore, you must specify a router ID when creating a process or configure an IP address for a minimum of one interface in the VPN instance.
vpn-instance *vpn-instance-name*	An OSPF process can belong to only one VPN instance. If you delete a VPN instance, all OSPF processes of the VPN instance are also deleted.

3. Redistribute remote site routes advertised by the PE into OSPF.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
4. Create an OSPF area and enter OSPF area view.

   area *area-id*
5. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to any area nor runs OSPF.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes these tasks:

- Binding the MCE-PE interfaces to VPN instances.
- Performing route configurations.
- Redistributing VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring static routing between an MCE and a PE

1. Enter system view.

   system-view
2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }
3. (Optional.) Set the default preference for static routes.

   ip route-static default-preference *default-preference*

   The default preference is 60.

Configuring RIP between an MCE and a PE

1. Enter system view.
   system-view
2. Create a RIP process for a VPN instance and enter RIP view.
   rip [*process-id*] **vpn-instance** *vpn-instance-name*
3. Enable RIP on the interface attached to the specified network.
   network *network-address* [*wildcard-mask*]
   By default, RIP is disabled on an interface.
4. Redistribute the VPN routes.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *
   By default, no routes are redistributed into RIP.

Configuring OSPF between an MCE and a PE

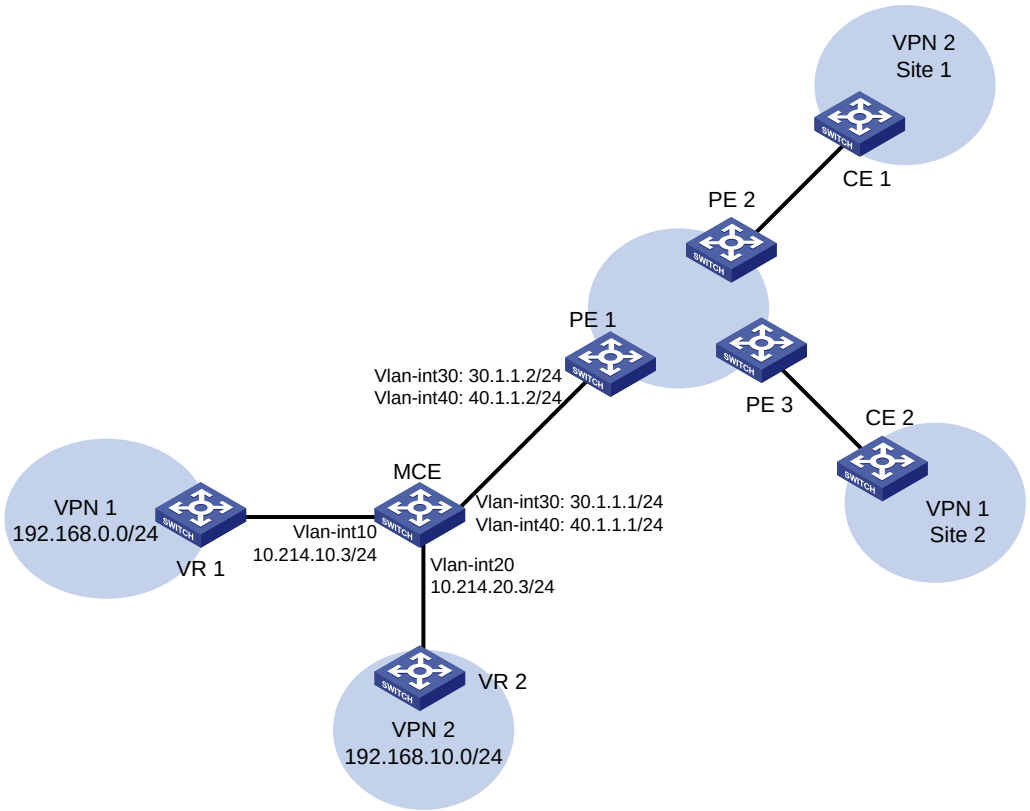
1. Enter system view.
   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable routing loop detection.
   vpn-instance-capability simple
   By default, routing loop detection is enabled and the MCE does not receive OSPF routes from the PE.
4. Redistribute the VPN routes.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   By default, no routes are redistributed into OSPF.
5. Create an OSPF area and enter OSPF area view.
   area *area-id*
6. Enable OSPF on the interface attached to the specified network in the area.
   network *ip-address wildcard-mask*
   By default, an interface neither belongs to an area nor runs OSPF.

Display and maintenance commands for MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



MCE configuration examples

Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE

Network configuration

As shown in Figure 4, VPN 2 runs OSPF. The edge devices of VPN 1 and VPN 2 are VR 1 and VR 2, respectively. Configure the MCE device to separate routes from different VPNs and to advertise the VPN routes to PE 1 through OSPF.

Figure 4 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   ```

```
[MCE-vpn-instance-vpn2] vpn-target 20:1
[MCE-vpn-instance-vpn2] quit
```

Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 10
[MCE-Vlan-interface10] ip binding vpn-instance vpn1
[MCE-Vlan-interface10] ip address 10.214.10.3 24
[MCE-Vlan-interface10] quit
```

Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ip binding vpn-instance vpn2
[MCE-Vlan-interface20] ip address 10.214.20.3 24
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure static routes.

On VR 1, assign IP address 10.214.10.2/24 to the interface connected to MCE and 192.168.0.1/24 to the interface connected to VPN 1. Add ports to VLANs correctly. (Details not shown.)

On VR 1, configure a default route with the next hop being 10.214.10.3.

```
<VR1> system-view
[VR1] ip route-static 0.0.0.0 0.0.0.0 10.214.10.3
```

On the MCE, configure a static route to 192.168.0.0/24 with the next hop 10.214.10.2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ip route-static vpn-instance vpn1 192.168.0.0 24 10.214.10.2
```

On the MCE, display the routing information maintained for VPN instance **vpn1**.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24     Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32     Direct  0   0           10.214.10.3     Vlan10
10.214.10.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32   Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
```

```
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24     Static  60  0           10.214.10.2     Vlan10
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has a static route for VPN instance **vpn1**.

Run OSPF in VPN 2. Create OSPF process 20 and bind it to VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ospf 2 vpn-instance vpn2
```

Advertise subnet 10.214.20.0.

```
[MCE-ospf-2] area 0
[MCE-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[MCE-ospf-2-area-0.0.0.0] quit
[MCE-ospf-2] quit
```

On VR 2, assign IP address 10.214.20.2/24 to the interface connected to MCE and 192.168.10.1/24 to the interface connected to VPN 2. (Details not shown.)

Configure OSPF process 2, and advertise subnets 192.168.10.0 and 10.214.20.0.

```
<VR2> system-view
[VR2] ospf 2
[VR2-ospf-2] area 0
[VR2-ospf-2-area-0.0.0.0] network 192.168.10.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] quit
[VR2-ospf-2] quit
```

On the MCE, display the routing information maintained for VPN instance **vpn2**.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface

192.168.10.0/24    O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private routes of VPN 2. The MCE maintains the routes of VPN 1 and those of VPN2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ip address 30.1.1.1 24
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ip address 40.1.1.1 24
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ip address 30.1.1.2 24
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ip address 40.1.1.2 24
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPF process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospf 10 router-id 101.101.10.1 vpn-instance vpn1
```

Disable OSPF routing loop detection for the VPN instance.

```
[MCE-ospf-10] vpn-instance-capability simple
```

Set the domain ID to 10.

```
[MCE-ospf-10] domain-id 10
```

On the MCE, advertise subnet 30.1.1.0 in area 0, and redistribute the static route of VPN 1.

```
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] import-route static
[MCE-ospf-10] quit
```

On PE 1, enable OSPF process 10, and bind the process to VPN instance **vpn1**.

```
[PE1] ospf 10 router-id 100.100.10.1 vpn-instance vpn1
```

Set the domain ID to 10.

```
[PE1-ospf-10] domain-id 10
```

Advertise subnet 30.1.1.0 in area 0.

```
[PE1-ospf-10] area 0
[PE1-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[PE1-ospf-10-area-0.0.0.0] quit
```

```
[PE1-ospf-10] quit
```

Use similar procedures to configure OSPF process 20 between MCE and PE 1 and redistribute VPN 2's routing information. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the static route of VPN 1 through OSPF.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
30.1.1.0/24        Direct  0   0           30.1.1.2        Vlan30
30.1.1.0/32        Direct  0   0           30.1.1.2        Vlan30
30.1.1.2/32        Direct  0   0           127.0.0.1       InLoop0
30.1.1.255/32      Direct  0   0           30.1.1.2        Vlan30
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24     O_ASE2  150 1           30.1.1.1        Vlan30
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

Verify that PE 1 has learned the routes of OSPF process 20 in VPN 2 through OSPF.

```
[PE1] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
40.1.1.0/24        Direct  0   0           40.1.1.2        Vlan40

```

The routing information for the two VPNs has been redistributed into the routing tables on PE 1.

Configuring IPv6 MCE

About IPv6 MCE

IPv6 MCE provides traffic separation between VPNs by distinguishing routes of the VPNs. It allows multiple VPNs to share the same CE with ensured data security in an IPv6 MPLS L3VPN network.

IPv6 MPLS L3VPN uses BGP to advertise IPv6 VPN routes and uses MPLS to forward IPv6 VPN packets on the service provider backbone.

IPv6 MCE uses the same working mechanism as MCE. It advertises IPv6 routes and exchanges IPv6 packets between the internal network and the PE.

Restrictions and guidelines: IPv6 MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

IPv6 MCE tasks at a glance

To configure IPv6 MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site
3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.

   system-view
2. Create a VPN instance and enter VPN instance view.

   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.

   route-distinguisher *route-distinguisher*

By default, no RD is configured for a VPN instance.

4. (Optional.) Configure a description for the VPN instance.

   description *text*

   By default, no description is configured for a VPN instance.

   The description should contain the VPN instance's related information, such as its relationship with a certain VPN.

5. (Optional.) Set an ID for the VPN instance.

   vpn-id *vpn-id*

   By default, no ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

   This interface connects the device to the CE.

3. Associate a VPN instance with the interface.

   ip binding vpn-instance *vpn-instance-name*

   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:

Associating a VPN instance with an interface or disassociating a VPN instance from an interface will clear the IP address and routing protocol settings of the interface.

Configuration of this command deletes the IPv6 address of the current interface. You must reconfigure an IPv6 address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv6 address family view, IPv6 VPN uses the configurations in VPN instance IPv6 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv6 address family view.

   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*

   - Enter VPN instance IPv6 address family view.

     ip vpn-instance *vpn-instance-name*

     address-family ipv6

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from storing too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring IPv6 static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through an IPv6 static route. IPv6 static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding an IPv6 static route with an IPv6 VPN instance, so that the IPv6 static routes of different IPv6 VPN instances can be isolated from each other.

Perform this configuration on the MCE. On a VPN site, configure normal IPv6 static routes.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Configure the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default preference for IPv6 static routes is 60.

Configuring RIPng between an MCE and a VPN site

About this task

By configuring RIPng process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different VPNs to be exchanged between the MCE and the sites through different RIPng processes, ensuring the separation and security of IPv6 VPN routes.

For more information about RIPng, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure normal RIPng.

Procedure

1. Enter system view.

   system-view
2. Create a RIPng process for a VPN instance and enter RIPng view.

   ripng [*process-id*] **vpn-instance** *vpn-instance-name*

   A RIPng process can belong to only one IPv6 VPN instance.
3. Redistribute remote site routes advertised by the PE.

   import-route *protocol* [*as-number* | *process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, no routes are redistributed into RIPng.
4. Return to system view.

   quit
5. Enter interface view.

   interface *interface-type interface-number*
6. Enable RIPng on the interface.

   ripng *process-id* **enable**

   By default, RIPng is disabled.

Configuring OSPFv3 between an MCE and a VPN site

About this task

By configuring OSPFv3 process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different IPv6 VPNs to be exchanged between the MCE and the sites through different OSPFv3 processes, ensuring the separation and security of IPv6 VPN routes.

For more information about OSPFv3, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure common OSPFv3.

Procedure

1. Enter system view.

   system-view
2. Create an OSPFv3 process for a VPN instance and enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

   An OSPFv3 process can belong to only one IPv6 VPN instance.

   Deleting a VPN instance also deletes all related OSPFv3 processes.
3. Set the router ID.

   router-id *router-id*
4. Redistribute remote site routes advertised by the PE.

import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

By default, no routes are redistributed into OSPFv3.

5. Return to system view.

quit

6. Enter interface view.

interface *interface-type interface-number*

7. Enable OSPFv3 on the interface.

ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

By default, OSPFv3 is disabled on an interface.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes the following tasks:

- Binding the MCE-PE interfaces to IPv6 VPN instances.
- Performing routing configurations.
- Redistributing IPv6 VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring IPv6 static routing between an MCE and a PE

1. Enter system view.

system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Set the default preference for IPv6 static routes.

ipv6 route-static default-preference *default-preference*

The default value is 60.

Configuring RIPng between an MCE and a PE

1. Enter system view.

system-view

2. Create a RIPng process for an IPv6 VPN instance and enter RIPng view.

ripng [*process-id*] **vpn-instance** *vpn-instance-name*

3. Redistribute VPN routes.

import-route *protocol* [*as-number* | *process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

By default, no routes are redistributed into RIPng.

4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable the RIPng process on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on an interface.

Configuring OSPFv3 between an MCE and a PE

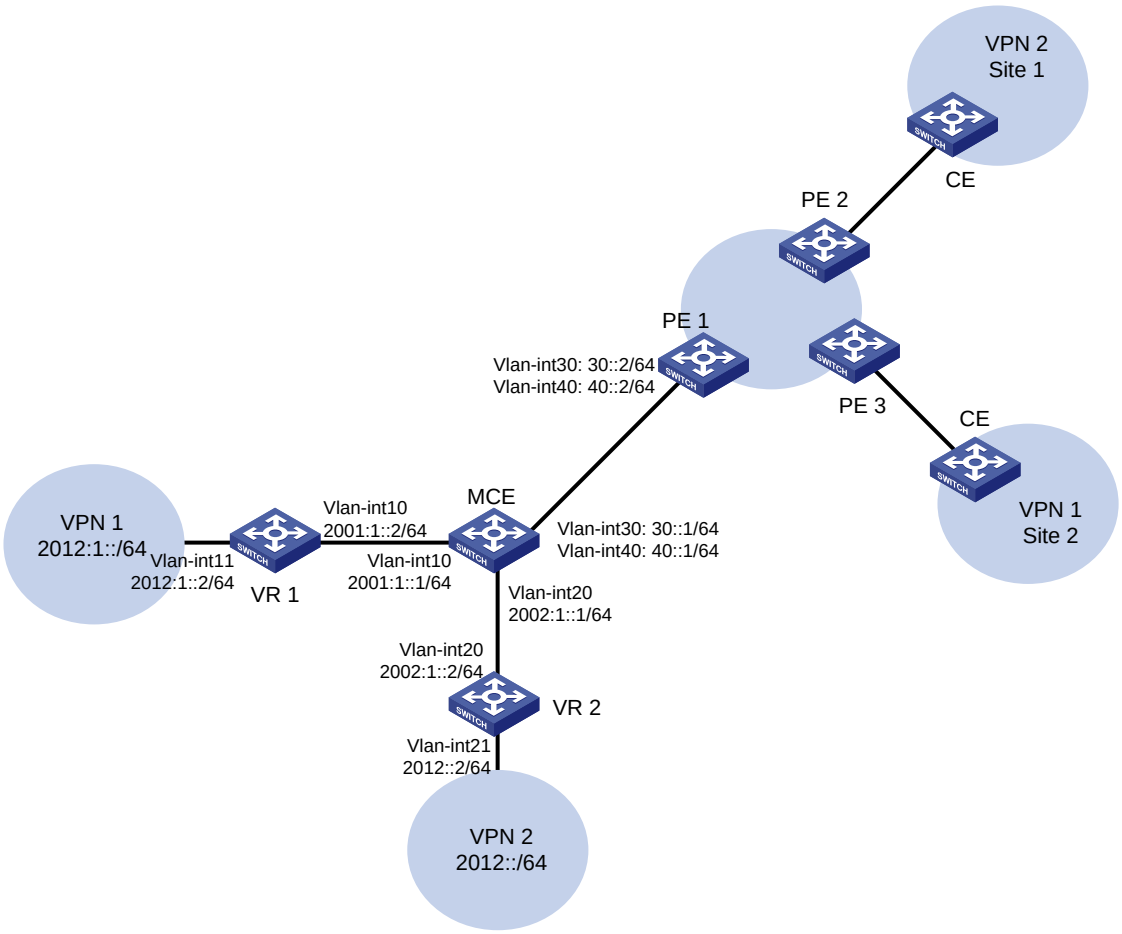
1. Enter system view.
   system-view
2. Create an OSPFv3 process for an IPv6 VPN instance and enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the router ID.
   router-id *router-id*
4. Disable routing loop detection.
   vpn-instance-capability simple
   By default, routing loop detection is enabled and the MCE does not receive OSPFv3 routes from the PE.
5. Redistribute VPN routes.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   By default, no routes are redistributed into OSPFv3.
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, OSPFv3 is disabled on an interface.

Display and maintenance commands for IPv6 MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



IPv6 MCE configuration examples

Example: Configuring IPv6 MCE

Network configuration

As shown in Figure 5, RIPng runs in VPN 2. The edge routers of VPN 1 and VPN 2 are VR1 and VR2, respectively. Configure the MCE device to separate routes from different VPNs and advertise VPN routes to PE 1 through OSPFv3.

Figure 5 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   ```

```
[MCE-vpn-instance-vpn2] vpn-target 20:1
[MCE-vpn-instance-vpn2] quit
```

Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 10
[MCE-Vlan-interface10] ip binding vpn-instance vpn1
[MCE-Vlan-interface10] ipv6 address 2001:1::1 64
[MCE-Vlan-interface10] quit
```

Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ip binding vpn-instance vpn2
[MCE-Vlan-interface20] ipv6 address 2002:1::1 64
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure IPv6 static routes.

On VR 1, assign IPv6 address 2001:1::2/64 to the interface connected to the MCE and 2012:1::2/64 to the interface connected to VPN 1. Add ports to VLANs. (Details not shown.)

On VR 1, configure a default route with the next hop being 2001:1::1.

```
<VR1> system-view
[VR1] ipv6 route-static :: 0 2001:1::1
```

On the MCE, configure an IPv6 static route to 2012:1::/64 with the next hop 2001:1::2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ipv6 route-static vpn-instance vpn1 2012:1:: 64 2001:1::2
```

Run RIPng in VPN 2. Configure RIPng process 20 for VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ripng 20 vpn-instance vpn2
```

Advertise subnet 2002:1::/64 through RIPng.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ripng 20 enable
[MCE-Vlan-interface20] quit
```

On VR 2, assign IPv6 address 2002:1::2/64 to the interface connected to the MCE and 2012::2/64 to the interface connected to VPN 2. (Details not shown.)

Configure RIPng, and advertise subnets 2012::/64 and 2002:1::/64.

```
<VR2> system-view
[VR2] ripng 20
[VR2-ripng-20] quit
```

```
[VR2] interface vlan-interface 20
[VR2-Vlan-interface20] ripng 20 enable
[VR2-Vlan-interface20] quit
[VR2] interface vlan-interface 21
[VR2-Vlan-interface21] ripng 20 enable
[VR2-Vlan-interface21] quit
```

On the MCE, display the routing tables of VPN instances **vpn1** and **vpn2**.

```
[MCE] display ipv6 routing-table vpn-instance vpn1

Destinations : 6 Routes : 6

Destination: ::1/128                                    Protocol  : Direct

```

The output shows that the MCE has learned the private route of VPN 2. The MCE maintains the routes of VPN 1 and VPN 2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ipv6 address 30::1 64
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ipv6 address 40::1 64
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ipv6 address 30::2 64
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ipv6 address 40::2 64
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPFv3 process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospfv3 10 vpn-instance vpn1
```

Redistribute the IPv6 static route of VPN 1.

```
[MCE-ospf-10] router-id 101.101.10.1
[MCE-ospf-10] import-route static
```

```
[MCE-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ospfv3 10 area 0.0.0.0
[MCE-Vlan-interface30] quit
```

On PE 1, enable OSPFv3 process 10 and bind the process to VPN instance **vpn1**.

```
[PE1] ospfv3 10 vpn-instance vpn1
[PE1-ospf-10] router-id 100.100.10.1
[PE1-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ospfv3 10 area 0.0.0.0
[PE1-Vlan-interface30] quit
```

Configure OSPFv3 process 20 between the MCE and PE 1. (Details not shown.)

Redistribute VPN 2's routes from RIPng process 20 into the OSPFv3 routing table of the MCE. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the private route of VPN 1 through OSPFv3.

```
[PE1] display ipv6 routing-table vpn-instance vpn1

Preface

This configuration guide describes how to classify traffic with ACLs, and allocate network resources and manage congestions with QoS technologies to improve network performance and network use efficiency. You can use ACLs to help other function modules (such as QoS and IP routing) classify or filter traffic.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.

Convention	Description
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring ACLs

About ACLs

An access control list (ACL) is a set of rules for identifying traffic based on criteria such as source IP address, destination IP address, and port number. The rules are also called permit or deny statements.

ACLs are primarily used for packet filtering. You can also use ACLs in QoS, security, routing, and other modules for identifying traffic. The packet drop or forwarding decisions depend on the modules that use ACLs.

Numbering and naming ACLs

When creating an ACL, you must assign it a number or name for identification. You can specify an existing ACL by its number or name. Each ACL type has a unique range of ACL numbers.

For basic or advanced ACLs with the same number, you must use the **ipv6** keyword to distinguish them. For ACLs with the same name, you must use the **ipv6**, **mac**, and **user-defined** keywords to distinguish them.

ACL types

Type	ACL number	IP version	Match criteria
Basic ACLs	2000 to 2999	IPv4	Source IPv4 address.
		IPv6	Source IPv6 address.
Advanced ACLs	3000 to 3999	IPv4	Source IPv4 address, destination IPv4 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
		IPv6	Source IPv6 address, destination IPv6 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
Layer 2 ACLs	4000 to 4999	IPv4 and IPv6	Layer 2 header fields, such as source and destination MAC addresses, 802.1p priority, and link layer protocol type.
		IPv6	Source IPv4 address and VPN instance
User-defined ACLs	5000 to 5999	IPv4 and IPv6	User specified matching patterns in protocol headers.

Match order

The rules in an ACL are sorted in a specific order. When a packet matches a rule, the device stops the match process and performs the action defined in the rule. If an ACL contains overlapping or conflicting rules, the matching result and action to take depend on the rule order.

The following ACL match orders are available:

- **config**—Sorts ACL rules in ascending order of rule ID. A rule with a lower ID is matched before a rule with a higher ID. If you use this method, check the rules and their order carefully.

NOTE:

The match order of user-defined ACLs can only be **config**.

- **auto**—Sorts ACL rules in depth-first order. Depth-first ordering makes sure any subset of a rule is always matched before the rule. The following table lists the sequence of tie breakers that depth-first ordering uses to sort rules for each type of ACL.

Table 1 Sort ACL rules in depth-first order

ACL type	Sequence of tie breakers
IPv4 basic ACL	**1.** VPN instance. **2.** More 0s in the source IPv4 address wildcard (more 0s means a narrower IPv4 address range). **3.** Rule configured earlier.
IPv4 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** More 0s in the source IPv4 address wildcard mask. **4.** More 0s in the destination IPv4 address wildcard. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
IPv6 basic ACL	**1.** VPN instance. **2.** Longer prefix for the source IPv6 address (a longer prefix means a narrower IPv6 address range). **3.** Rule configured earlier.
IPv6 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** Longer prefix for the source IPv6 address. **4.** Longer prefix for the destination IPv6 address. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
Layer 2 ACL	**1.** More 1s in the source MAC address mask (more 1s means a smaller MAC address). **2.** More 1s in the destination MAC address mask. **3.** Rule configured earlier.

A wildcard mask, also called an inverse mask, is a 32-bit binary number represented in dotted decimal notation. In contrast to a network mask, the 0 bits in a wildcard mask represent "do care" bits, and the 1 bits represent "don't care" bits. If the "do care" bits in an IP address are identical to the "do care" bits in an IP address criterion, the IP address matches the criterion. All "don't care" bits are ignored. The 0s and 1s in a wildcard mask can be noncontiguous. For example, 0.255.0.255 is a valid wildcard mask.

Comments and remarks for rules

An ACL can have multiple rules. To identify rules, you can add a comment for each rule one by one, or add the same remark for multiple rules.

- For rules requiring different identification, you can add a comment for a particular rule or add a different comment for each rule.
- For a range of rules requiring the same identification, you can insert a remark before the start rule and a remark after the end rule. This configuration mode eliminates the need for configuring a comment for each rule one by one and improves configuration efficiency.

Rule numbering

ACL rules can be manually numbered or automatically numbered. This section describes how automatic ACL rule numbering works.

Rule numbering step

If you do not assign an ID to the rule you are creating, the system automatically assigns it a rule ID. The rule numbering step sets the increment by which the system automatically numbers rules. For example, the default ACL rule numbering step is 5. If you do not assign IDs to rules you are creating, they are automatically numbered 0, 5, 10, 15, and so on. The wider the numbering step, the more rules you can insert between two rules.

By introducing a gap between rules rather than contiguously numbering rules, you have the flexibility of inserting rules in an ACL. This feature is important for a config-order ACL, where ACL rules are matched in ascending order of rule ID.

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step or start rule ID changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Automatic rule numbering and renumbering

The ID automatically assigned to an ACL rule takes the nearest higher multiple of the numbering step to the current highest rule ID, starting with 0.

For example, if the step is 5, and there are five rules numbered 0, 5, 9, 10, and 12, the newly defined rule is numbered 15. If the ACL does not contain a rule, the first rule is numbered 0.

Whenever the step changes, the rules are renumbered, starting from 0. For example, changing the step from 5 to 2 renumbers rules 5, 10, 13, and 15 as rules 0, 2, 4, and 6.

For an ACL of the match order **auto**, rules are sorted in depth-first order, and are renumbered based on the match order. For example, rules are in the match order of 0, 10, and 5. Changing the numbering step to 2 renumbers rules 0, 10, and 5 (not 0, 5, and 10) as rules 0, 2, 4.

Fragment filtering with ACLs

Traditional packet filtering matches only first fragments of packets, and allows all subsequent non-first fragments to pass through. Attackers can fabricate non-first fragments to attack networks.

To avoid risks, the ACL feature is designed as follows:

- Filters all fragments by default, including non-first fragments.
- Allows for matching criteria modification for efficiency. For example, you can configure the ACL to filter only non-first fragments.

Restrictions and guidelines: ACL configuration

- If you create a numbered ACL, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **number** *acl-number*.
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } *acl-number*.

- If you create a ACL by using the **acl** [**ipv6**] **number** *acl-number* **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*].
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name*.
- If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name*.

  In an IPv6 advanced ACL rule, the **type** *routing-type* option does not take effect.

ACL tasks at a glance

To configure an ACL, perform the following tasks:

- Configure ACLs according to the characteristics of the packets to be matched
  - Configuring a basic ACL
  - Configuring an advanced ACL
  - Configuring a Layer 2 ACL
  - Configuring a user-defined ACL
- (Optional.) Copying an ACL
- (Optional.) Configuring packet filtering with ACLs

Configuring a basic ACL

About basic ACLs

Basic ACLs match packets based only on source IP addresses.

Basic ACLs can be used in the following scenarios:

- To improve security when the device acts as an FTP or TFTP server, you can use basic ACLs to allow only matching clients to access the server. For more information, see FTP and TFTP configuration in *Fundamentals Configuration Guide*.
- To filter routes in a routing policy, you can use basic ACLs to receive or send matching routes. For more information about routing policy, see *Layer 3—IP Routing Configuration Guide*.
- To take different QoS actions on different traffic types, you can use basic ACLs to classify traffic. For more information about traffic classes, see "Configuring QoS."

Configuring an IPv4 basic ACL

1. Enter system view.

   system-view
2. Create an IPv4 basic ACL and enter its view. Choose one option as needed:
   - Create an IPv4 basic ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

- Create an IPv4 basic ACL by specifying the **basic** keyword.

  acl basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv4 basic ACL.

   description *text*

   By default, an IPv4 basic ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring an IPv6 basic ACL

1. Enter system view.

   system-view

2. Create an IPv6 basic ACL view and enter its view. Choose one option as needed:

   - Create an IPv6 basic ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

   - Create an IPv6 basic ACL by specifying the **basic** keyword.

     acl ipv6 basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 basic ACL.

   description *text*

   By default, an IPv6 basic ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **routing** [**type** *routing-type*] | **source** { *source-address source-prefix* | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring an advanced ACL

About advanced ACLs

Advanced ACLs can be used in the following scenarios:

- When the device acts as an FTP or TFTP server, you can use advanced ACLs to allow only matching clients to access the server. For more information, see FTP and TFTP configuration in *Fundamentals Configuration Guide*.
- In a multicast scenario, you can use advanced ACLs in a multicast source policy to receive or forward only matching multicast packets. For more information about multicast source policy, see PIM configuration and IPv6 PIM configuration in *IP Multicast Configuration Guide*.
- To filter routes in a routing policy, you can use advanced ACLs to receive or send matching routes. For more information about routing policy, see *Layer 3—IP Routing Configuration Guide*.
- To take different QoS actions on different traffic types, you can use advanced ACLs to classify traffic. For more information about traffic classification see "Configuring QoS."

Advanced ACLs match packets based on the following criteria:

- Source IP addresses.
- Destination IP addresses.
- Packet priorities.
- Protocol types.
- Other protocol header information, such as TCP/UDP source and destination port numbers, TCP flags, ICMP message types, and ICMP message codes.

Compared to basic ACLs, advanced ACLs allow more flexible and accurate filtering.

Configuring an IPv4 advanced ACL

1. Enter system view.

   system-view

2. Create an IPv4 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv4 advanced ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 advanced ACL by specifying the **advanced** keyword.

     acl advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv4 advanced ACL.

   description *text*

   By default, an IPv4 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | **precedence** *precedence* | **dscp** *dscp* } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring an IPv6 advanced ACL

1. Enter system view.

   system-view

2. Create an IPv6 advanced ACL and enter its view. Choose one option as needed:

   - Create a numbered IPv6 advanced ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

   - Create an IPv6 advanced ACL by specifying the **advanced** keyword.

     acl ipv6 advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 advanced ACL.

   description *text*

   By default, an IPv6 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **destination-port** *operator port1* [*port2*] | | **dscp** *dscp* | **flow-label** *flow-label-value* | **fragment** | **icmp6-type** { *icmp6-type icmp6-code* | *icmp6-message* } | **logging** | **routing** [**type** *routing-type*] | **hop-by-hop** [**type** *hop-type*] | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1*

[*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring a Layer 2 ACL

About this task

Layer 2 ACLs can be used in the following scenarios:

- To improve security when the device acts as a Telnet server, you can use Layer 2 ACLs to allow only matching clients to access the server. For more information, see login management in *Fundamentals Configuration Guide*.
- To take different QoS actions on different traffic types, you can use Layer 2 ACLs to classify traffic. For more information about traffic classes, see "Configuring QoS."

Layer 2 ACLs, also called Ethernet frame header ACLs, match packets based on Layer 2 Ethernet header fields, such as:

- Source MAC address.
- Destination MAC address.
- 802.1p priority (VLAN priority).
- Link layer protocol type.
- Encapsulation type.

Procedure

1. Enter system view.

   system-view

2. Create a Layer 2 ACL and enter its view. Choose one option as needed:
   - Create a Layer 2 ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create a Layer 2 ACL by specifying the **mac** keyword.

     acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the Layer 2 ACL.

   description *text*

   By default, a Layer 2 ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | { **lsap** *lsap-type lsap-type-mask* | **type**

protocol-type protocol-type-mask } | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring a user-defined ACL

About this task

User-defined ACLs allow you to customize rules based on information in protocol headers. You can define a user-defined ACL to match packets. A specific number of bytes after an offset (relative to the specified header) are compared against a match pattern after being ANDed with a match pattern mask.

Procedure

1. Enter system view.

   system-view

2. Create a user-defined ACL and enter its view. Choose one option as needed:

   - Create a user-defined ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*]

   - Create a user-defined ACL by specifying the **user-defined** keyword.

     acl user-defined { *acl-number* | **name** *acl-name* }

3. (Optional.) Configure a description for the user-defined ACL.

   description *text*

   By default, a user-defined ACL does not have a description.

4. Create or edit a rule.

   Command set 1:

   rule [*rule-id*] { **deny** | **permit** } [**ipv6-protocol**] *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** { *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | **dscp** *dscp* } | **source** { *source-address source-wildcard* | **any** } | **source-port** { *operator port1* [*port2*] } | **vpn-instance** *vpn-instance-name*] * [{ { **ipv4** | **ipv6** } *rule-string rule-mask offset* }&<1-8>] [**counting** | **time-range** *time-range-name*] *

   Command set 2:

   rule [*rule-id*] { *deny* | *permit* } **dual-stack** { **tcp** | **udp** } [{ **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **destination any** | **destination-port** { *operator port1* [*port2*] } | **source any** | **source-port** { *operator port1* [*port2*] } | **vpn-instance** *vpn-instance-name*] * [**counting** | **time-range** *time-range-name*] *

5. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

By default, no rule comment is configured.

6. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Copying an ACL

About this task

You can create an ACL by copying an existing ACL (source ACL). The new ACL (destination ACL) has the same properties and content as the source ACL, but uses a different number or name than the source ACL.

Restrictions and guidelines

To successfully copy an ACL, make sure:

- The destination ACL is the same type as the source ACL.
- The source ACL already exists, but the destination ACL does not.

Procedure

1. Enter system view.

   system-view

2. Copy an existing ACL to create a new ACL.

   acl [**ipv6** | **mac** | **user-defined**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Configuring packet filtering with ACLs

About packet filtering with ACLs

This section describes procedures for using an ACL to filtering packets. For example, you can apply an ACL to an interface to filter incoming or outgoing packets.

Applying an ACL to filter packets globally

1. Enter system view.

   system-view

2. Apply an ACL globally.

   packet-filter [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } **global** { **inbound** | **outbound** } [**hardware-count**]

   By default, global packet filtering is not configured.

Applying an ACL to an interface for packet filtering

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an ACL to the interface to filter packets.

packet-filter [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** } [**hardware-count**]

By default, an interface does not filter packets.

Configuring the applicable scope of packet filtering on a VLAN interface

About this task

You can configure the packet filtering on a VLAN interface to filter the following packets:

- Packets forwarded at Layer 3 by the VLAN interface.
- All packets, including packets forwarded at Layer 3 by the VLAN interface and packets forwarded at Layer 2 by the physical ports associated with the VLAN interface.

Procedure

1. Enter system view.
   system-view
2. Create a VLAN interface and enter its view.
   interface vlan-interface *vlan-interface-id*
   If the VLAN interface already exists, you directly enter its view.
   By default, no VLAN interface exists.
3. Specify the applicable scope of packet filtering on the VLAN interface.
   packet-filter filter [**route** | **all**]
   By default, the packet filtering filters packets forwarded at Layer 3.

Setting the packet filtering default action

1. Enter system view.
   system-view
2. Set the packet filtering default action to deny.
   packet-filter default deny
   By default, the packet filter permits packets that do not match any ACL rule to pass.

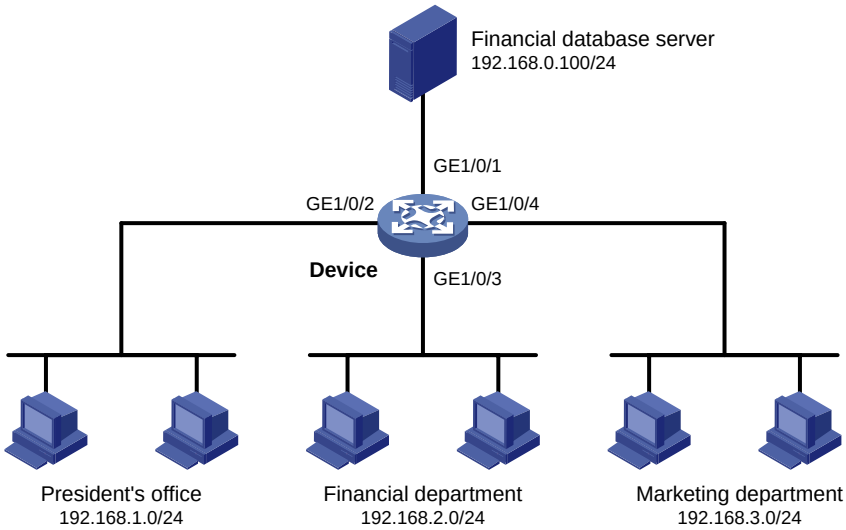
Display and maintenance commands for ACL

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ACL configuration and match statistics.	**display acl** [**ipv6**	**mac**	**user-defined**] { *acl-number*	**all**	**name** *acl-name* }
Display ACL application information for packet filtering.	**display packet-filter** { **global**	**interface** [*interface-type interface-number*] } [**inbound**	**outbound**] [**slot** *slot-number*]
Display match statistics for packet filtering ACLs.	**display packet-filter statistics** { **global**	**interface** *interface-type interface-number* } { **inbound**	**outbound** } [[**ipv6**	**mac**	**user-defined**] { *acl-number*	**name** *acl-name* }] [**brief**]

Task	Command
Display the accumulated statistics for packet filtering ACLs.	**display packet-filter statistics sum** { **inbound** | **outbound** } [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } [**brief**]
Display detailed ACL packet filtering information.	**display packet-filter verbose** { **global** | **interface** *interface-type interface-number* } { **inbound** | **outbound** } [[**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* }] [**slot** *slot-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Clear ACL statistics.	**reset acl** [**ipv6** | **mac** | **user-defined**] **counter** { *acl-number* | **all** | **name** *acl-name* }
Clear match statistics for packet filtering ACLs.	**reset packet-filter statistics** { **global** | **interface** [*interface-type interface-number*] } { **inbound** | **outbound** } [[**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* }]

ACL configuration examples



Example: Configuring interface-based packet filter

Network configuration

A company interconnects its departments through the device. Configure a packet filter to:

- Permit access from the President's office at any time to the financial database server.
- Permit access from the Finance department to the database server only during working hours (from 8:00 to 18:00) on working days.
- Deny access from any other department to the database server.

Figure 1 Network diagram

Procedure

Create a periodic time range from 8:00 to 18:00 on working days.

```
<Device> system-view
[Device] time-range work 08:0 to 18:00 working-day
```

Create an IPv4 advanced ACL numbered 3000.

```
[Device] acl advanced 3000
```

Configure a rule to permit access from the President's office to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.1.0 0.0.0.255 destination
192.168.0.100 0
```

Configure a rule to permit access from the Finance department to the database server during working hours.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.2.0 0.0.0.255 destination
192.168.0.100 0 time-range work
```

Configure a rule to deny access to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule deny ip source any destination 192.168.0.100 0
[Device-acl-ipv4-adv-3000] quit
```

Apply IPv4 advanced ACL 3000 to filter outgoing packets on interface GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] packet-filter 3000 outbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that a PC in the Finance department can ping the database server during working hours. (All PCs in this example use Windows XP).

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Reply from 192.168.0.100: bytes=32 time=1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Verify that a PC in the Marketing department cannot ping the database server during working hours.

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Display configuration and match statistics for IPv4 advanced ACL 3000 on the device during working hours.

```
[Device] display acl 3000
Advanced IPv4 ACL 3000, 3 rules,
ACL's step is 5
 rule 0 permit ip source 192.168.1.0 0.0.0.255 destination 192.168.0.100 0
 rule 5 permit ip source 192.168.2.0 0.0.0.255 destination 192.168.0.100 0 time-range work
(Active)
 rule 10 deny ip destination 192.168.0.100 0
```

The output shows that rule 5 is active. Rule 5 and rule 10 have been matched four times as the result of the ping operations.

QoS overview

In data communications, Quality of Service (QoS) provides differentiated service guarantees for diversified traffic in terms of bandwidth, delay, jitter, and drop rate, all of which can affect QoS.

QoS manages network resources and prioritizes traffic to balance system resources.

The following section describes typical QoS service models and widely used QoS techniques.

QoS service models

This section describes several typical QoS service models.

Best-effort service model

The best-effort model is a single-service model. The best-effort model is not as reliable as other models and does not guarantee delay-free delivery.

The best-effort service model is the default model for the Internet and applies to most network applications. It uses the First In First Out (FIFO) queuing mechanism.

IntServ model

The integrated service (IntServ) model is a multiple-service model that can accommodate diverse QoS requirements. This service model provides the most granularly differentiated QoS by identifying and guaranteeing definite QoS for each data flow.

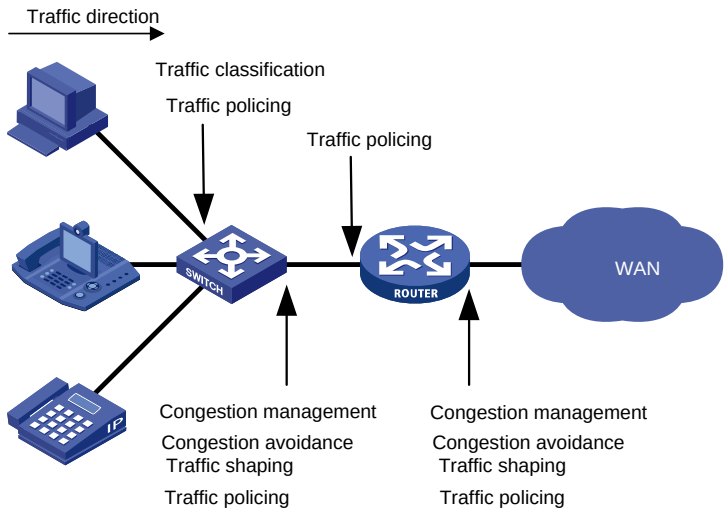
In the IntServ model, an application must request service from the network before it sends data. IntServ signals the service request with the RSVP. All nodes receiving the request reserve resources as requested and maintain state information for the application flow.

The IntServ model demands high storage and processing capabilities because it requires all nodes along the transmission path to maintain resource state information for each flow. This model is suitable for small-sized or edge networks. However, it is not suitable for large-sized networks, for example, the core layer of the Internet, where billions of flows are present.

DiffServ model

The differentiated service (DiffServ) model is a multiple-service model that can meet diverse QoS requirements. It is easy to implement and extend. DiffServ does not signal the network to reserve resources before sending data, as IntServ does.

QoS techniques in a network



The QoS techniques include the following features:

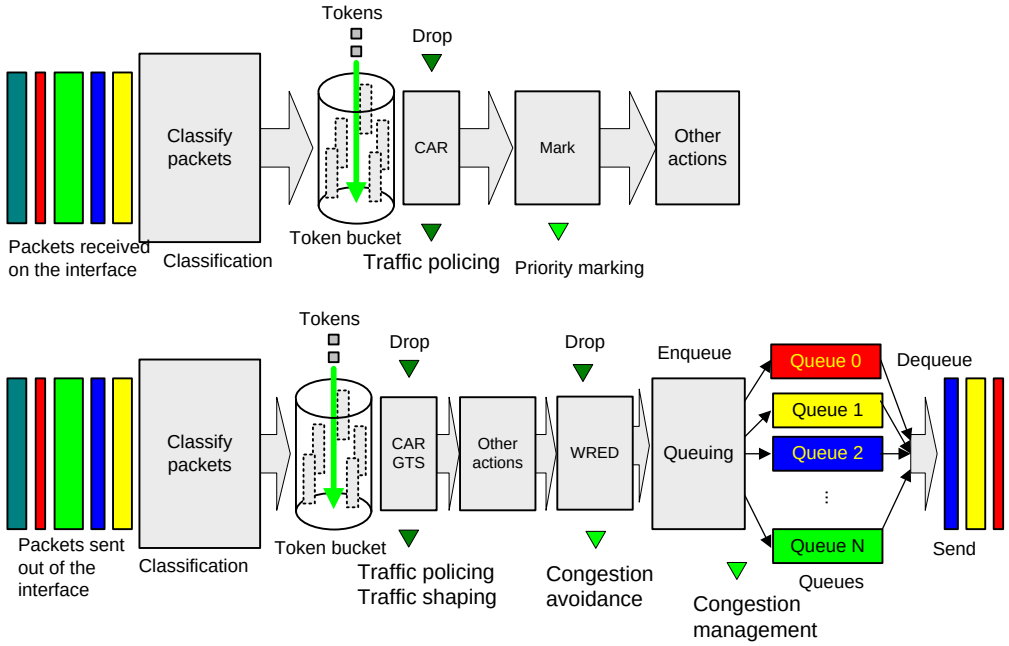
- Traffic classification.
- Traffic policing.
- Traffic shaping.
- Rate limit.
- Congestion management.
- Congestion avoidance.

The following section briefly introduces these QoS techniques.

All QoS techniques in this document are based on the DiffServ model.

Figure 1 Position of the QoS techniques in a network

As shown in Figure 1, traffic classification, traffic shaping, traffic policing, congestion management, and congestion avoidance mainly implement the following functions:



- **Traffic classification**—Uses match criteria to assign packets with the same characteristics to a traffic class. Based on traffic classes, you can provide differentiated services.
- **Traffic policing**—Polices flows and imposes penalties to prevent aggressive use of network resources. You can apply traffic policing to both incoming and outgoing traffic of a port.
- **Traffic shaping**—Adapts the output rate of traffic to the network resources available on the downstream device to eliminate packet drops. Traffic shaping usually applies to the outgoing traffic of a port.
- **Congestion management**—Provides a resource scheduling policy to determine the packet forwarding sequence when congestion occurs. Congestion management usually applies to the outgoing traffic of a port.
- **Congestion avoidance**—Monitors the network resource usage. It is usually applied to the outgoing traffic of a port. When congestion worsens, congestion avoidance reduces the queue length by dropping packets.

QoS processing flow in a device

Figure 2 briefly describes how the QoS module processes traffic.

1. Traffic classifier identifies and classifies traffic for subsequent QoS actions.
2. The QoS module takes various QoS actions on classified traffic as configured, depending on the traffic processing phase and network status. For example, you can configure the QoS module to perform the following operations:
   - Traffic policing for incoming traffic.
   - Traffic shaping for outgoing traffic.
   - Congestion avoidance before congestion occurs.
   - Congestion management when congestion occurs.

Figure 2 QoS processing flow

QoS configuration approaches

You can configure QoS by using the MQC approach or non-MQC approach.

In the modular QoS configuration (MQC) approach, you configure QoS service parameters by using QoS policies. A QoS policy defines QoS actions to take on different classes of traffic and can be applied to an object (such as an interface) to control traffic.

In the non-MQC approach, you configure QoS service parameters without using a QoS policy. For example, you can use the rate limit feature to set a rate limit on an interface without using a QoS policy.

Some features support both approaches, but some support only one.

Configuring a QoS policy

About QoS policies

A QoS policy has the following components:

- **Traffic class**—Defines criteria to match packets.
- **Traffic behavior**—Defines QoS actions to take on matching packets.

By associating a traffic class with a traffic behavior, a QoS policy can perform the QoS actions on matching packets.

A QoS policy can have multiple class-behavior associations.

The switch supports the following QoS policy types: TCP ERSPAN, IPv6-matching, accounting, mirroring, marking, and generic. Unless otherwise noted, a QoS policy in this document refers to a generic QoS policy.

QoS policy tasks at a glance

To configure a QoS policy, perform the following tasks:

1. Defining a traffic class
2. Defining a traffic behavior
3. Defining a QoS policy
4. Applying the QoS policy
   - Applying the QoS policy to an interface
   - Applying the QoS policy to VLANs
   - Applying the QoS policy globally
   - Applying the QoS policy to a control plane
   - Applying the QoS policy to a user profile

Defining a traffic class

1. Enter system view.
   system-view
2. Create a traffic class and enter traffic class view.
   traffic classifier *classifier-name* [**operator** { **and** | **or** }]
3. (Optional.) Configure a description for the traffic class.
   description *text*
   By default, no description is configured for a traffic class.
4. Configure a match criterion.
   if-match *match-criteria*
   By default, no match criterion is configured.
   For more information, see the **if-match** command in *ACL and QoS Command Reference*.

Defining a traffic behavior

1. Enter system view.
   system-view
2. Create a traffic behavior and enter traffic behavior view.
   traffic behavior *behavior-name*
3. Configure an action in the traffic behavior.
   By default, no action is configured for a traffic behavior.
   For more information about configuring an action, see the subsequent chapters for traffic policing, traffic filtering, priority marking, class-based accounting, and so on.

Defining a QoS policy

1. Enter system view.
   system-view
2. Create a QoS policy and enter QoS policy view.
   qos [**remarking**] **policy** *policy-name*

Parameter	Description
remarking	Represents a marking-type QoS policy.

3. Associate a traffic class with a traffic behavior to create a class-behavior association in the QoS policy.
   classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]
   By default, a traffic class is not associated with a traffic behavior.
   Repeat this step to create more class-behavior associations.

Applying the QoS policy

Application destinations

You can apply a QoS policy to the following destinations:

- **Interface**—The QoS policy can be applied to the traffic sent or received on the interface.
- **VLAN**—The QoS policy can be applied to the traffic sent or received on all ports in the VLAN.
- **Globally**—The QoS policy can be applied to the traffic sent or received on all ports.
- **Control plane**—The QoS policy can be applied to the traffic received on the control plane.
- **User profile**—The QoS policy can be applied to the traffic sent or received by the online users of the user profile.

Restrictions and guidelines for applying a QoS policy

You can modify traffic classes, traffic behaviors, and class-behavior associations in a QoS policy even after it is applied (except that it is applied to a user profile). If a traffic class uses an ACL for traffic classification, you can delete or modify the ACL.

If a traffic behavior is configured with multiple actions and one of these actions does not take effect, the whole class-behavior association does not take effect.

Applying the QoS policy to an interface

Restrictions and guidelines

A QoS policy can be applied to multiple interfaces. However, only one QoS policy can be applied to one direction (inbound or outbound) of an interface.

The QoS policy applied to the outgoing traffic on an interface does not regulate local packets. Local packets refer to critical protocol packets sent by the local system for operation maintenance. The most common local packets include link maintenance, RIP, and SSH packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply the QoS policy to the interface.
   qos apply [**remarking**] **policy** *policy-name* { **inbound** | **outbound**
   By default, no QoS policy is applied to an interface.

Applying the QoS policy to VLANs

About this task

You can apply a QoS policy to VLANs to regulate the traffic on all ports of the VLANs.

Restrictions and guidelines

QoS policies cannot be applied to dynamic VLANs, including VLANs created by GVRP.

When you apply a QoS policy to VLANs, the QoS policy is applied to the specified VLANs on all IRF member devices. If the hardware resources of an IRF member device are insufficient, applying a QoS policy to VLANs might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, use the **undo qos vlan-policy vlan** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.
   system-view
2. Apply the QoS policy to VLANs.
   qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a VLAN.

Applying the QoS policy globally

About this task

You can apply a QoS policy globally to the inbound or outbound direction of all ports.

Restrictions and guidelines

If you do not specify the **longest-match** keyword, the system matches traffic against traffic classes in the order class-behavior associations are configured. When the traffic matches a traffic class, the matching process stops, and the actions in the associated traffic behavior are taken on the matching traffic.

If the hardware resources of an IRF member device are insufficient, applying a QoS policy globally might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, you must use the **undo qos apply policy global** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.

   system-view

2. Apply the QoS policy globally.

   qos apply [**remarking**] **policy** *policy-name* **global** { **inbound** | **outbound** }

   By default, no QoS policy is applied globally.

Applying the QoS policy to a control plane

About this task

A device provides the user plane and the control plane.

- **User plane**—The units at the user plane are responsible for receiving, transmitting, and switching (forwarding) packets, such as various dedicated forwarding chips. They deliver super processing speeds and throughput.
- **Control plane**—The units at the control plane are processing units running most routing and switching protocols. They are responsible for protocol packet resolution and calculation, such as CPUs. Compared with user plane units, the control plane units allow for great packet processing flexibility but have lower throughput.

When the user plane receives packets that it cannot recognize or process, it transmits them to the control plane. If the transmission rate exceeds the processing capability of the control plane, the control plane will be busy handling undesired packets. As a result, the control plane will fail to handle legitimate packets correctly or timely. As a result, protocol performance is affected.

To address this problem, apply a QoS policy to the control plane to take QoS actions, such as traffic filtering or traffic policing, on inbound traffic. This ensures that the control plane can correctly receive, transmit, and process packets.

A predefined control plane QoS policy uses the protocol type or protocol group type to identify the type of packets sent to the control plane. You can use protocol types or protocol group types in **if-match control-plane** commands in traffic class view for traffic classification. Then you can reconfigure traffic behaviors for these traffic classes as required.

Procedure

1. Enter system view.

   system-view

2. Enter control plane view.

   control-plane slot *slot-number*

3. Apply the QoS policy to the control plane.

   qos apply policy *policy-name* **inbound**

   By default, no QoS policy is applied to a control plane.

Applying the QoS policy to a user profile

About this task

When a user profile is configured, you can perform traffic policing based on users. After a user passes authentication, the authentication server sends the name of the user profile associated with the user to the device. The QoS policy configured in user profile view takes effect only when users come online.

Restrictions and guidelines

You can apply a QoS policy to multiple user profiles. In one direction of each user profile, only one policy can be applied. To modify a QoS policy already applied to a direction, first remove the applied QoS policy.

Procedure

1. Enter system view.
   system-view
2. Enter user profile view.
   user-profile *profile-name*
3. Apply the QoS policy to the user profile.
   qos apply policy *policy-name* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a user profile.

Parameter	Description
inbound	Applies a QoS policy to the traffic received by the device from the user profile.
outbound	Applies a QoS policy to the traffic sent by the device to the user profile.

Display and maintenance commands for QoS policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display QoS policy configuration.	**display qos policy user-defined** [**remarking**] [*policy-name* [**classifier** *classifier-name*]] [**slot** *slot-number*]
Display information about QoS policies applied to the control plane.	**display qos policy control-plane slot** *slot-number*
Display information about QoS policies applied globally.	**display qos** [**remarking**] **policy global** [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to interfaces.	**display qos** [**remarking**] **policy interface** [*interface-type interface-number*] [**inbound** | **outbound**]

Task	Command
Display information about QoS policies applied to VLANs.	**display qos vlan-policy** { **name** *policy-name* | **vlan** [*vlan-id*] } [**slot** *slot-number*] [**inbound** | **outbound**]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*] [**slot** *slot-number*]
Display traffic class configuration.	**display traffic classifier user-defined** [*classifier-name*] [**slot** *slot-number*]
Clear the statistics for a QoS policy applied globally.	**reset qos** [**remarking**] **policy global** [**inbound** | **outbound**]
Clear the statistics for the QoS policy applied to the control plane.	**reset qos policy control-plane slot** *slot-number*
Clear the statistics of the QoS policy applied in a certain direction of a VLAN.	**reset qos vlan-policy** [**vlan** *vlan-id*] [**inbound** | **outbound**]

Configuring priority mapping

About priority mapping

When a packet arrives, a device assigns a set of QoS priority parameters to the packet based on either of the following:

- A priority field carried in the packet.
- The port priority of the incoming port.

This process is called priority mapping. During this process, the device can modify the priority of the packet according to the priority mapping rules. The set of QoS priority parameters decides the scheduling priority and forwarding priority of the packet.

Priority mapping is implemented with priority maps and involves the following priorities:

- 802.11e priority.
- 802.1p priority.
- DSCP.
- EXP.
- IP precedence.
- Local precedence.
- Drop priority.

About priorities

Priorities include the following types: priorities carried in packets, and priorities locally assigned for scheduling only.

Packet-carried priorities include 802.1p priority, DSCP precedence, IP precedence, and EXP. These priorities have global significance and affect the forwarding priority of packets across the network. For more information about these priorities, see "Appendixes."

Locally assigned priorities only have local significance. They are assigned by the device only for scheduling. These priorities include the local precedence, drop priority, and user priority, as follows:

- **Local precedence**—Used for queuing. A local precedence value corresponds to an output queue. A packet with higher local precedence is assigned to a higher priority output queue to be preferentially scheduled.
- **Drop priority**—Used for making packet drop decisions. Packets with the highest drop priority are dropped preferentially.
- **User priority**—Precedence that the device automatically extracts from a priority field of the packet according to its forwarding path. It is a parameter for determining the scheduling priority and forwarding priority of the packet. The user priority represents the following items:
  - The 802.1p priority for Layer 2 packets.
  - The IP precedence for Layer 3 packets.
  - The EXP for MPLS packets.

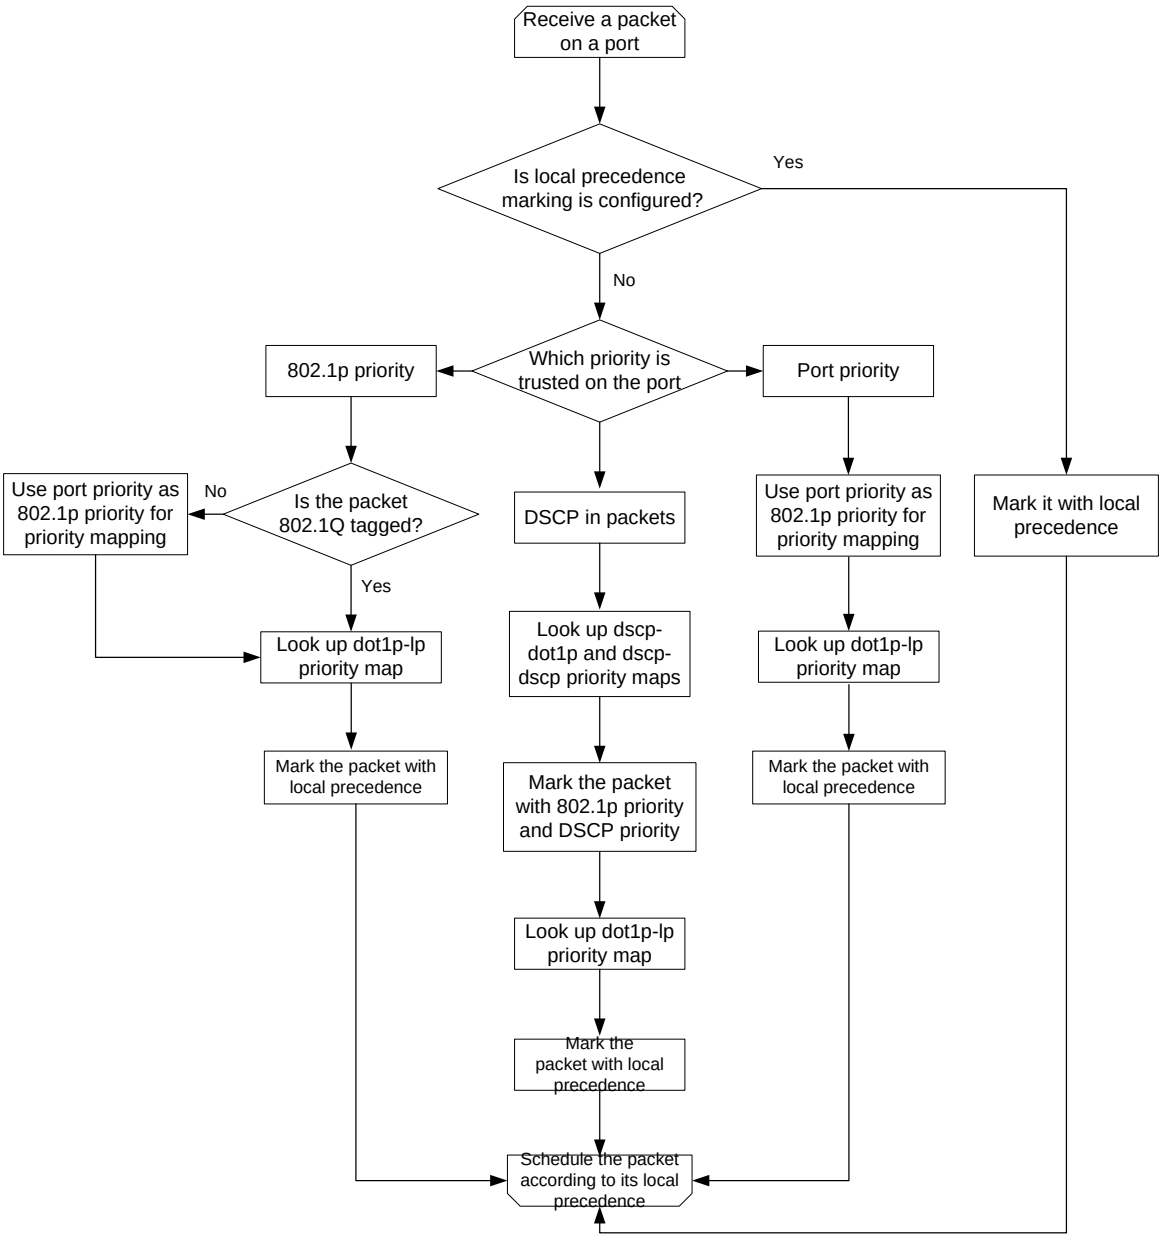
The device supports only local precedence and drop priority for scheduling.

Priority maps

The device provides various types of priority maps. By looking through a priority map, the device decides which priority value to assign to a packet for subsequent packet processing.

The default priority maps (as shown in Appendix B Default priority maps) are available for priority mapping. They are adequate in most cases. If a default priority map cannot meet your requirements, you can modify the priority map as required.

Priority mapping configuration methods



You can configure priority mapping by using any of the following methods:

- **Configuring priority trust mode**—In this method, you can configure a port to look up a trusted priority type (802.1p, for example) in incoming packets in the priority maps. Then, the system maps the trusted priority to the target priority types and values.
- **Changing port priority**—If no packet priority is trusted, the port priority of the incoming port is used. By changing the port priority of a port, you change the priority of the incoming packets on the port.

Priority mapping process

On receiving an Ethernet packet on a port, the switch marks the scheduling priorities (local precedence and drop precedence) for the Ethernet packet. This procedure is done according to the priority trust mode of the receiving port and the 802.1Q tagging status of the packet, as shown in Figure 3.

Figure 3 Priority mapping process for an Ethernet packet

For information about priority marking, see "Configuring priority marking."

Priority mapping tasks at a glance

To configure priority mapping, perform the following tasks:

1. (Optional.) Configuring a priority map
2. Configure a priority mapping method:
   - Configuring a port to trust packet priority for priority mapping
   - Changing the port priority of an interface

Configuring a priority map

1. Enter system view.

   system-view
2. Enter priority map view.

   qos map-table { **dot1p-lp** | **dscp-dot1p** | **dscp-dscp** }
3. Configure mappings for the priority map.

   import *import-value-list* **export** *export-value*

   By default, the default priority maps are used. For more information, see "Appendix B Default priority maps."

   If you execute this command multiple times, the most recent configuration takes effect.

Configuring a port to trust packet priority for priority mapping

About this task

You can configure the device to trust a particular priority field carried in packets for priority mapping on ports or globally. When you configure the trusted packet priority type on an interface, use the following available keywords:

- **dot1p**—Uses the 802.1p priority of received packets for mapping.
- **dscp**—Uses the DSCP precedence of received IP packets for mapping.

Restrictions and guidelines

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the trusted packet priority type.

   qos trust { **dot1p** | **dscp** }

   By default, an interface does not trust any packet priority and uses the port priority as the 802.1p priority for mapping.

Changing the port priority of an interface

About this task

If an interface does not trust any packet priority, the device uses its port priority to look for priority parameters for the incoming packets. By changing port priority, you can prioritize traffic received on different interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Set the port priority of the interface.
   qos priority [**dscp**] *priority-value*
   The default setting is 0.

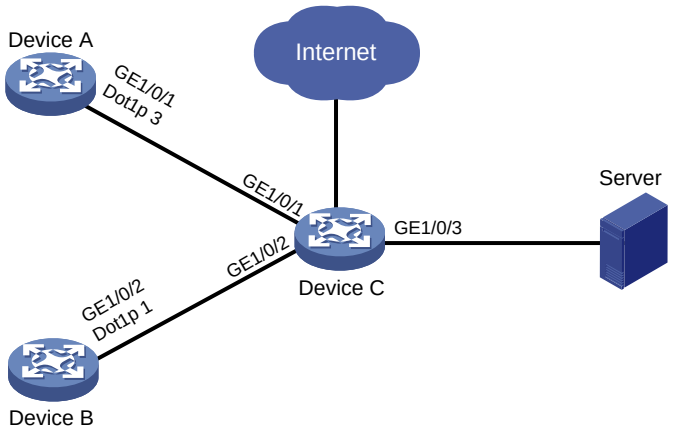
Display and maintenance commands for priority mapping

Execute **display** commands in any view.

Task	Command
Display priority map configuration.	**display qos map-table** [**dot1p-lp** | **dscp-dot1p** | **dscp-dscp**]
Display the trusted packet priority type on a port.	**display qos trust interface** [*interface-type interface-number*]

Priority mapping configuration examples

Example: Configuring a priority trust mode



Network configuration

As shown in Figure 4:

- The 802.1p priority of traffic from Device A to Device C is 3.
- The 802.1p priority of traffic from Device B to Device C is 1.

Configure Device C to preferentially process packets from Device A to the server when GigabitEthernet 1/0/3 of Device C is congested.

Figure 4 Network diagram

Procedure

(Method 1) Configure Device C to trust packet priority

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to trust the 802.1p priority for priority mapping.

```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos trust dot1p
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos trust dot1p
[DeviceC-GigabitEthernet1/0/2] quit
```

(Method 2) Configure Device C to trust port priority

Assign port priority to GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. Make sure the following requirements are met:

- The priority of GigabitEthernet 1/0/1 is higher than that of GigabitEthernet 1/0/2.
- No trusted packet priority type is configured on GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2.

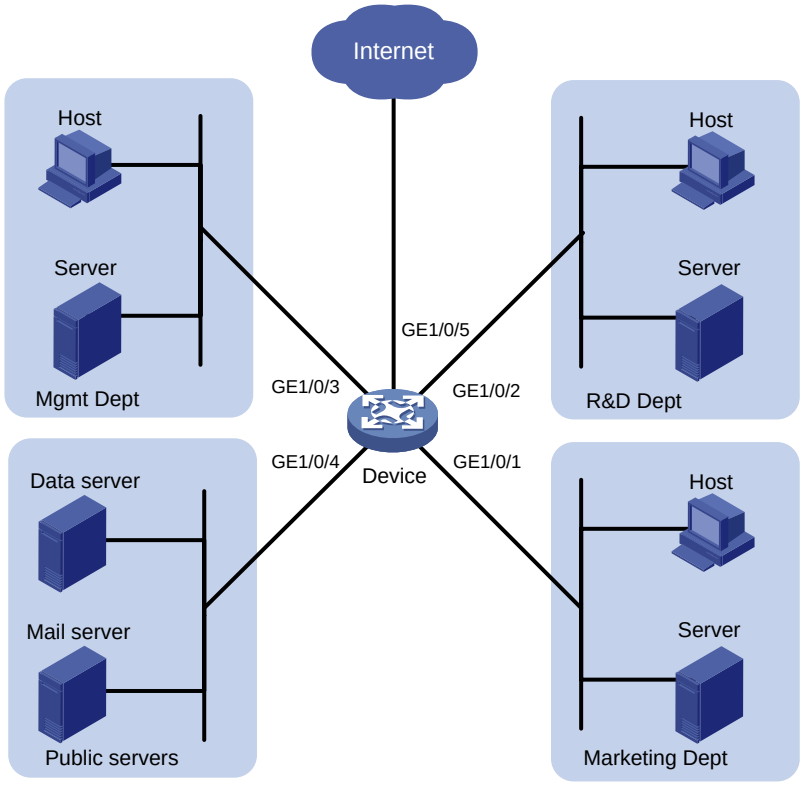
```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos priority 3
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos priority 1
[DeviceC-GigabitEthernet1/0/2] quit
```

Example: Configuring priority mapping tables and priority marking

Network configuration

As shown in Figure 5:

- The Marketing department connects to GigabitEthernet 1/0/1 of Device, which sets the 802.1p priority of traffic from the Marketing department to 3.
- The R&D department connects to GigabitEthernet 1/0/2 of Device, which sets the 802.1p priority of traffic from the R&D department to 4.
- The Management department connects to GigabitEthernet 1/0/3 of Device, which sets the 802.1p priority of traffic from the Management department to 5.



Configure port priority, 802.1p-to-local mapping table, and priority marking to implement the plan as described in Table 1.

Table 1 Configuration plan

Traffic destination	Traffic priority order	Queuing plan		
		Traffic source	Output queue	Queue priority
Public servers	R&D department > Management department > Marketing department	R&D department	6	High
		Management department	4	Medium
		Marketing department	2	Low
Internet	Management department > Marketing department > R&D	R&D department	2	Low
		Management department	6	High

	department	Marketing department	4	Medium

Figure 5 Network diagram

Procedure

1. Configure trusting port priority:

   # Set the port priority of GigabitEthernet 1/0/1 to 3.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] qos priority 3
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Set the port priority of GigabitEthernet 1/0/2 to 4.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] qos priority 4
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Set the port priority of GigabitEthernet 1/0/3 to 5.

   ```
   [Device] interface gigabitethernet 1/0/3
   [Device-GigabitEthernet1/0/3] qos priority 5
   [Device-GigabitEthernet1/0/3] quit
   ```

2. Configure the 802.1p-to-local mapping table to map 802.1p priority values 3, 4, and 5 to local precedence values 2, 6, and 4.

   This guarantees the R&D department, Management department, and Marketing department decreased priorities to access the public servers.

   ```
   [Device] qos map-table dot1p-lp
   [Device-maptbl-dot1p-lp] import 3 export 2
   [Device-maptbl-dot1p-lp] import 4 export 6
   ```

```
[Device-maptbl-dot1p-lp] import 5 export 4
[Device-maptbl-dot1p-lp] quit
```

3. Configure priority marking to mark the packets from Management department, Marketing department, and R&D department to the Internet with 802.1p priority values 4, 5, and 3.

This guarantees the Management department, Marketing department, and R&D department decreased priorities to access the Internet.

Create ACL 3000, and configure a rule to match HTTP packets.

```
[Device] acl advanced 3000
[Device-acl-adv-3000] rule permit tcp destination-port eq 80
[Device-acl-adv-3000] quit
```

Create a traffic class named **http**, and use ACL 3000 as a match criterion.

```
[Device] traffic classifier http
[Device-classifier-http] if-match acl 3000
[Device-classifier-http] quit
```

Create a traffic behavior named **admin**, and configure a marking action for the Management department.

```
[Device] traffic behavior admin
[Device-behavior-admin] remark dot1p 4
[Device-behavior-admin] quit
```

Create a QoS policy named **admin**, and associate traffic class **http** with traffic behavior **admin** in QoS policy **admin**.

```
[Device] qos policy admin
[Device-qospolicy-admin] classifier http behavior admin
[Device-qospolicy-admin] quit
```

Apply QoS policy **admin** to the inbound direction of GigabitEthernet 1/0/3.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos apply policy admin inbound
```

Create a traffic behavior named **market**, and configure a marking action for the Marketing department.

```
[Device] traffic behavior market
[Device-behavior-market] remark dot1p 5
[Device-behavior-market] quit
```

Create a QoS policy named **market**, and associate traffic class **http** with traffic behavior **market** in QoS policy **market**.

```
[Device] qos policy market
[Device-qospolicy-market] classifier http behavior market
[Device-qospolicy-market] quit
```

Apply QoS policy **market** to the inbound direction of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy market inbound
```

Create a traffic behavior named **rd**, and configure a marking action for the R&D department.

```
[Device] traffic behavior rd
[Device-behavior-rd] remark dot1p 3
[Device-behavior-rd] quit
```

Create a QoS policy named **rd**, and associate traffic class **http** with traffic behavior **rd** in QoS policy **rd**.

```
[Device] qos policy rd
[Device-qospolicy-rd] classifier http behavior rd
```

```
[Device-qospolicy-rd] quit
```

Apply QoS policy **rd** to the inbound direction of GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos apply policy rd inbound
[Device-GigabitEthernet1/0/2] quit
```

Configuring traffic policing, GTS, and rate limit

About traffic policing, GTS, and rate limit

Traffic limit helps assign network resources (including bandwidth) and increase network performance. For example, you can configure a flow to use only the resources committed to it in a certain time range. This avoids network congestion caused by burst traffic.

Traffic policing, Generic Traffic Shaping (GTS), and rate limit control the traffic rate and resource usage according to traffic specifications. You can use token buckets for evaluating traffic specifications.

Traffic evaluation and token buckets

Token bucket features

A token bucket is analogous to a container that holds a certain number of tokens. Each token represents a certain forwarding capacity. The system puts tokens into the bucket at a constant rate. When the token bucket is full, the extra tokens cause the token bucket to overflow.

Evaluating traffic with the token bucket

A token bucket mechanism evaluates traffic by looking at the number of tokens in the bucket. If the number of tokens in the bucket is enough for forwarding the packets:

- The traffic conforms to the specification (called conforming traffic).
- The corresponding tokens are taken away from the bucket.

Otherwise, the traffic does not conform to the specification (called excess traffic).

A token bucket has the following configurable parameters:

- Mean rate at which tokens are put into the bucket, which is the permitted average rate of traffic. It is usually set to the committed information rate (CIR).
- Burst size or the capacity of the token bucket. It is the maximum traffic size permitted in each burst. It is usually set to the committed burst size (CBS). The set burst size must be greater than the maximum packet size.

Each arriving packet is evaluated.

Complicated evaluation

You can set two token buckets, bucket C and bucket E, to evaluate traffic in a more complicated environment and achieve more policing flexibility. The following are main mechanisms used for complicated evaluation:

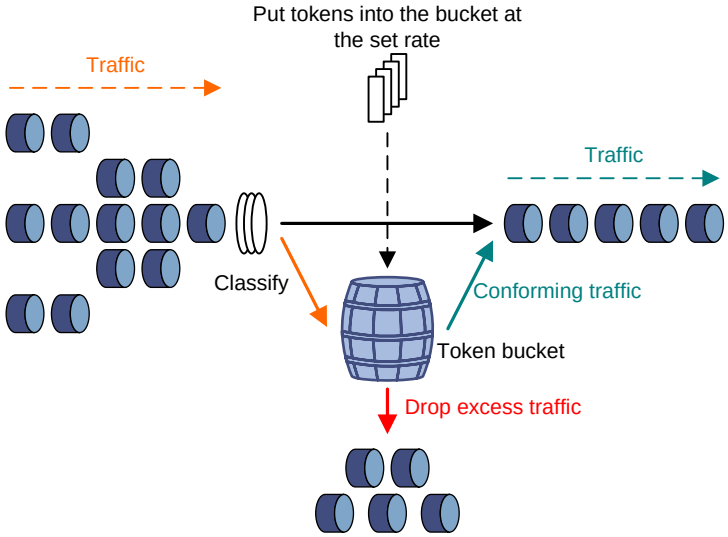
- **Single rate two color**—Uses one token bucket and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens to forward the packet, the packet is colored green.
  - Otherwise, the packet is colored red.
- **Single rate three color**—Uses two token buckets and the following parameters:

- **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
- **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
- **EBS**—Size of bucket E minus size of bucket C, which specifies the transient burst of traffic that bucket E can forward. The EBS cannot be 0. The size of E bucket is the sum of the CBS and EBS.

When a packet arrives, the following rules apply:

- If bucket C has enough tokens, the packet is colored green.
- If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
- If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.



- **Two rate three color**—Uses two token buckets and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
  - **PIR**—Rate at which tokens are put into bucket E, which specifies the average packet transmission or forwarding rate allowed by bucket E.
  - **EBS**—Size of bucket E, which specifies the transient burst of traffic that bucket E can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens, the packet is colored green.
  - If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
  - If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.

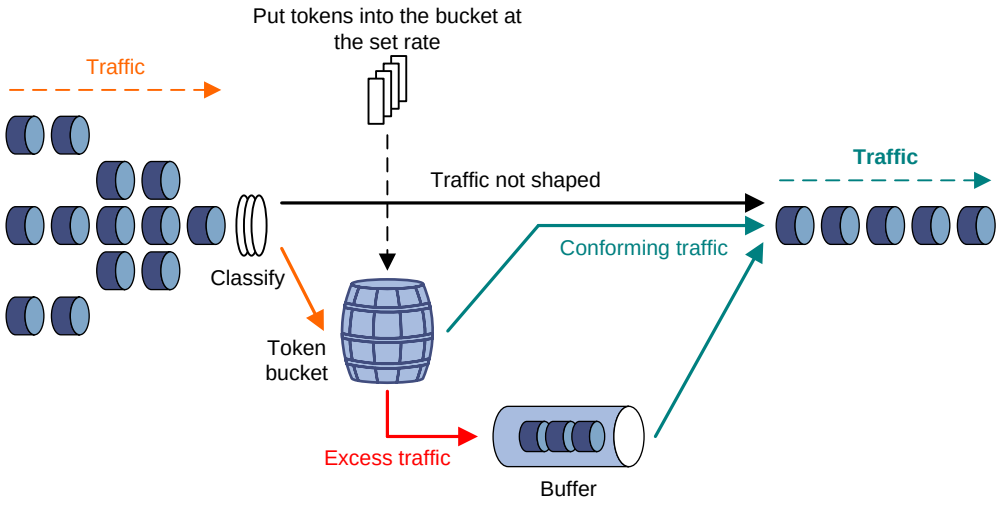
Traffic policing

A typical application of traffic policing is to supervise the specification of traffic entering a network and limit it within a reasonable range. Another application is to "discipline" the extra traffic to prevent aggressive use of network resources by an application. For example, you can limit bandwidth for HTTP packets to less than 50% of the total. If the traffic of a session exceeds the limit, traffic policing can drop the packets or reset the IP precedence of the packets. Figure 6 shows an example of policing outbound traffic on an interface.

Figure 6 Traffic policing

Traffic policing can classify the policed traffic and take predefined policing actions on each packet depending on the evaluation result:

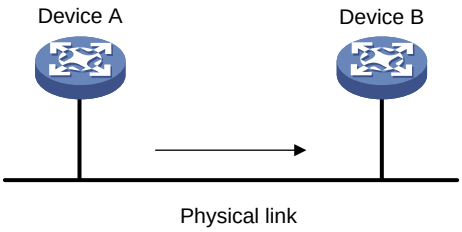
- Forwarding the packet.
- Dropping the packet.
- Forwarding the packet with its precedence re-marked.
- Delivering the packet to next-level traffic policing with its precedence re-marked.



GTS

GTS limits the traffic rate by buffering exceeding traffic. You can use GTS to adapt the traffic output rate on a device to the input traffic rate of its connected device to avoid packet loss.

The differences between traffic policing and GTS are as follows:

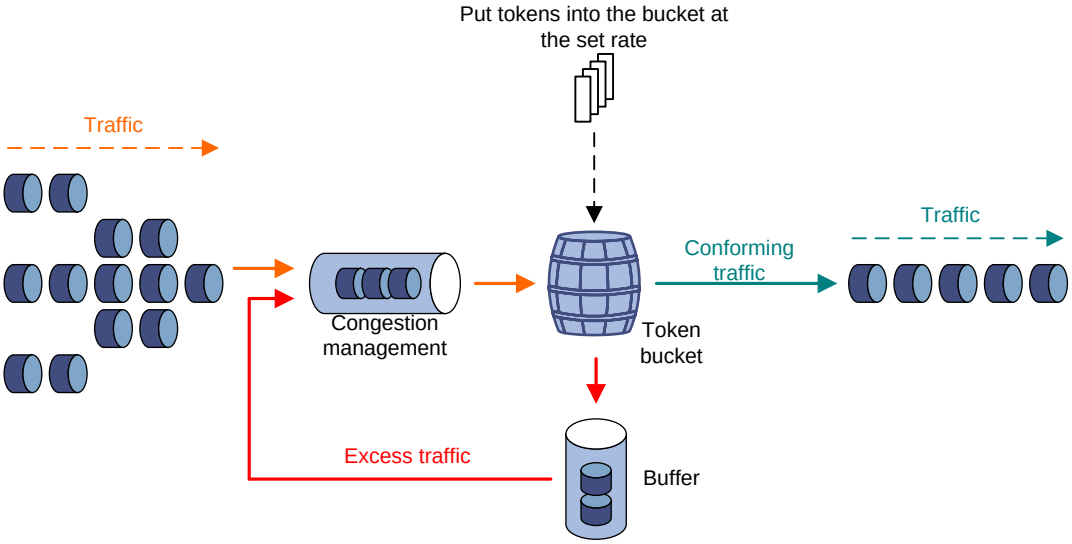


- Packets to be dropped with traffic policing are retained in a buffer or queue with GTS, as shown in Figure 7. When enough tokens are in the token bucket, the buffered packets are sent at an even rate.
- GTS can result in additional delay and traffic policing does not.

Figure 7 GTS

For example, in Figure 8, Device B performs traffic policing on packets from Device A and drops packets exceeding the limit. To avoid packet loss, you can perform GTS on the outgoing interface of Device A so that packets exceeding the limit are cached in Device A. Once resources are released, GTS takes out the cached packets and sends them out.

Figure 8 GTS application



Rate limit

The rate limit of an interface or PW specifies the maximum rate for forwarding packets (excluding critical packets).

Rate limit also uses token buckets for traffic control. When rate limit is configured on an interface, a token bucket handles all packets to be sent through the interface for rate limiting. If enough tokens are in the token bucket, packets can be forwarded. Otherwise, packets are put into QoS queues for congestion management. In this way, the traffic passing the interface is controlled.

Figure 9 Rate limit implementation

The token bucket mechanism limits traffic rate when accommodating bursts. It allows bursty traffic to be transmitted if enough tokens are available. If tokens are scarce, packets cannot be transmitted until efficient tokens are generated in the token bucket. It restricts the traffic rate to the rate for generating tokens.

Rate limit controls the total rate of all packets on an interface. It is easier to use than traffic policing in controlling the total traffic rate.

Restrictions and guidelines: Traffic policing, GTS, and rate limit configuration

The specified CIR does not take traffic transmitted in interframe gaps into account, and the actually allowed rate on an interface is greater than the specified CIR.

An interframe gap is a time interval for transmitting 12 bits between frames. This gap serves the following roles:

- Allows the device to differentiate one frame from another.
- Allows for time for the device to process the current frame and to prepare for receiving the next frame.

Configuring traffic policing

Configuring traffic policing by using the MQC approach

Restrictions and guidelines

A traffic policing action takes effect only when a QoS policy is applied to the following application destinations:

- Interface.
- VLANs.
- Globally.
- Control plane.

- User profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic policing action.
      car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]][**green** *action* | **red** *action* | **yellow** *action*] *
      car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *
      By default, no traffic policing action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.

Configuring traffic policing for a user profile

About this task

When a user profile is configured, you can perform traffic policing based on users. After a user passes authentication, the authentication server sends the name of the user profile associated with the user to the device. When any user of the user profile logs in, the authentication server

automatically applies the CAR parameters configured for the user profile to the user. When the user logs off, the system automatically removes the CAR configuration without manual intervention.

Procedure

1. Enter system view.

   system-view

2. Enter user profile view.

   user-profile *profile-name*

3. Configure a CAR policy for the user profile.

   qos car { **inbound** | **outbound** } **any cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]]

   qos car { **inbound** | **outbound** } **any cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*]

   By default, no CAR policy is configured for a user profile.

Configuring GTS

Restrictions and guidelines

A queue-based GTS action takes effect only on outgoing traffic in the specified queue.

The term "interface" in this section collectively refers to Layer 2 Ethernet interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure GTS for a queue.

   qos gts queue *queue-id* **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

   By default, GTS is not configured on an interface queue.

Configuring the rate limit

Configuring the rate limit for an interface

Restrictions and guidelines

The term "interface" in this section refers to Layer 2 Ethernet interfaces.

As a best practice to increase the rate limit accuracy, set the CIR to be greater than 400 kbps.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the rate limit for the interface.

   qos lr { **inbound** | **outbound** } **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

   By default, no rate limit is configured on an interface.

Display and maintenance commands for traffic policing, GTS, and rate limit

Execute **display** commands in any view.

Task	Command
Display GTS configuration and statistics for interfaces.	**display qos gts interface** [*interface-type interface-number*]
Display rate limit configuration and statistics.	**display qos lr interface** [*interface-type interface-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*]

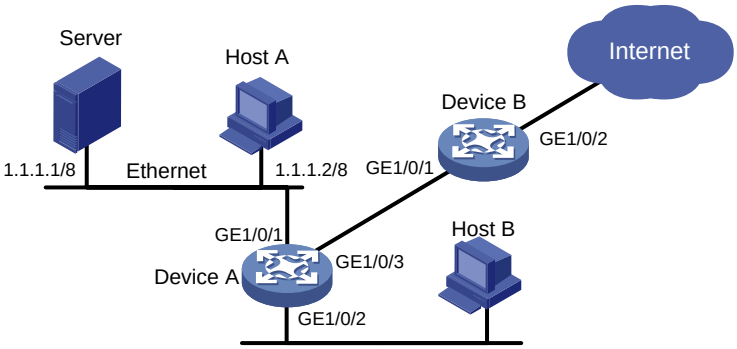
Traffic policing, GTS, and rate limit configuration examples

Example: Configuring traffic policing

Network requirements

As shown in Figure 10:

- The server, Host A, and Host B can access the Internet through Device A and Device B.
- The server, Host A, and GigabitEthernet 1/0/1 of Device A are in the same network segment.
- Host B and GigabitEthernet 1/0/2 of Device A are in the same network segment.



Perform traffic control for the packets that GigabitEthernet 1/0/1 of Device A receives from the server and Host A using the following guidelines:

- Limit the rate of packets from the server to 10240 kbps. When the traffic rate is below 10240 kbps, the traffic is forwarded. When the traffic rate exceeds 10240 kbps, the excess packets are marked with DSCP value 0 and then forwarded.
- Limit the rate of packets from Host A to 2560 kbps. When the traffic rate is below 2560 kbps, the traffic is forwarded. When the traffic rate exceeds 2560 kbps, the excess packets are dropped.

Perform traffic control on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 of Device B using the following guidelines:

- Limit the incoming traffic rate on GigabitEthernet 1/0/1 to 20480 kbps, and the excess packets are dropped.
- Limit the outgoing traffic rate on GigabitEthernet 1/0/2 to 10240 kbps, and the excess packets are dropped.

Figure 10 Network diagram

Configuration procedure

1. Configure Device A:

   # Configure ACL 2001 and ACL 2002 to permit the packets from the server and Host A, respectively.

```
<DeviceA> system-view
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[DeviceA-acl-ipv4-basic-2001] quit
[DeviceA] acl basic 2002
[DeviceA-acl-ipv4-basic-2002] rule permit source 1.1.1.2 0
[DeviceA-acl-ipv4-basic-2002] quit
```

   # Create a traffic class named **server**, and use ACL 2001 as the match criterion.

```
[DeviceA] traffic classifier server
[DeviceA-classifier-server] if-match acl 2001
[DeviceA-classifier-server] quit
```

   # Create a traffic class named **host**, and use ACL 2002 as the match criterion.

```
[DeviceA] traffic classifier host
[DeviceA-classifier-host] if-match acl 2002
[DeviceA-classifier-host] quit
```

   # Create a traffic behavior named **server**, and configure a traffic policing action to set the DSCP priority of red packets to 0 and then forwards them.

```
[DeviceA] traffic behavior server
[DeviceA-behavior-server] car cir 10240 red remark-dscp-pass 0
[DeviceA-behavior-server] quit
```

   # Create a traffic behavior named **host**, and configure a traffic policing action (CIR 2560 kbps).

```
[DeviceA] traffic behavior host
[DeviceA-behavior-host] car cir 2560
[DeviceA-behavior-host] quit
```

   # Create a QoS policy named **car**, and associate traffic classes **server** and **host** with traffic behaviors **server** and **host** in QoS policy **car**, respectively.

```
[DeviceA] qos policy car
[DeviceA-qospolicy-car] classifier server behavior server
[DeviceA-qospolicy-car] classifier host behavior host
[DeviceA-qospolicy-car] quit
```

   # Apply QoS policy **car** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
```

```
[DeviceA-GigabitEthernet1/0/1] qos apply policy car inbound
[DeviceA-GigabitEthernet1/0/1] quit
```

2. Configure Device B:

Create ACL 3001, and configure a rule to match HTTP packets.

```
<DeviceB> system-view
[DeviceB] acl advanced 3001
[DeviceB-acl-adv-3001] rule permit tcp destination-port eq 80
[DeviceB-acl-adv-3001] quit
```

Create a traffic class named **http**, and use ACL 3001 as a match criterion.

```
[DeviceB] traffic classifier http
[DeviceB-classifier-http] if-match acl 3001
[DeviceB-classifier-http] quit
```

Create a traffic class named **class**, and configure the traffic class to match all packets.

```
[DeviceB] traffic classifier class
[DeviceB-classifier-class] if-match any
[DeviceB-classifier-class] quit
```

Create a traffic behavior named **car_inbound**, and configure a traffic policing action (CIR 20480 kbps).

```
[DeviceB] traffic behavior car_inbound
[DeviceB-behavior-car_inbound] car cir 20480
[DeviceB-behavior-car_inbound] quit
```

Create a traffic behavior named **car_outbound**, and configure a traffic policing action (CIR 10240 kbps).

```
[DeviceB] traffic behavior car_outbound
[DeviceB-behavior-car_outbound] car cir 10240
[DeviceB-behavior-car_outbound] quit
```

Create a QoS policy named **car_inbound**, and associate traffic class **class** with traffic behavior **car_inbound** in QoS policy **car_inbound**.

```
[DeviceB] qos policy car_inbound
[DeviceB-qospolicy-car_inbound] classifier class behavior car_inbound
[DeviceB-qospolicy-car_inbound] quit
```

Create a QoS policy named **car_outbound**, and associate traffic class **http** with traffic behavior **car_outbound** in QoS policy **car_outbound**.

```
[DeviceB] qos policy car_outbound
[DeviceB-qospolicy-car_outbound] classifier http behavior car_outbound
[DeviceB-qospolicy-car_outbound] quit
```

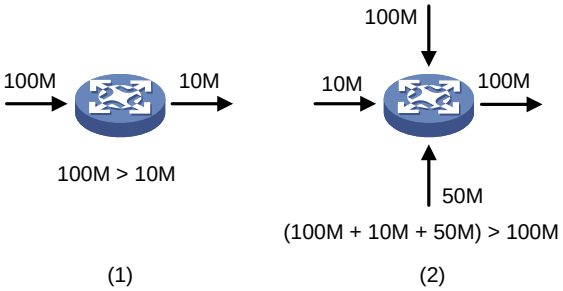
Apply QoS policy **car_inbound** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] qos apply policy car_inbound inbound
```

Apply QoS policy **car_outbound** to the outbound direction of GigabitEthernet 1/0/2.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] qos apply policy car_outbound outbound
[DeviceB-GigabitEthernet1/0/2] quit
```

Configuring congestion management



About congestion management

Cause, negative results, and countermeasure of congestion

Congestion occurs on a link or node when traffic size exceeds the processing capability of the link or node. It is typical of a statistical multiplexing network and can be caused by link failures, insufficient resources, and various other causes.

Figure 11 shows two typical congestion scenarios.

Figure 11 Traffic congestion scenarios

Congestion produces the following negative results:

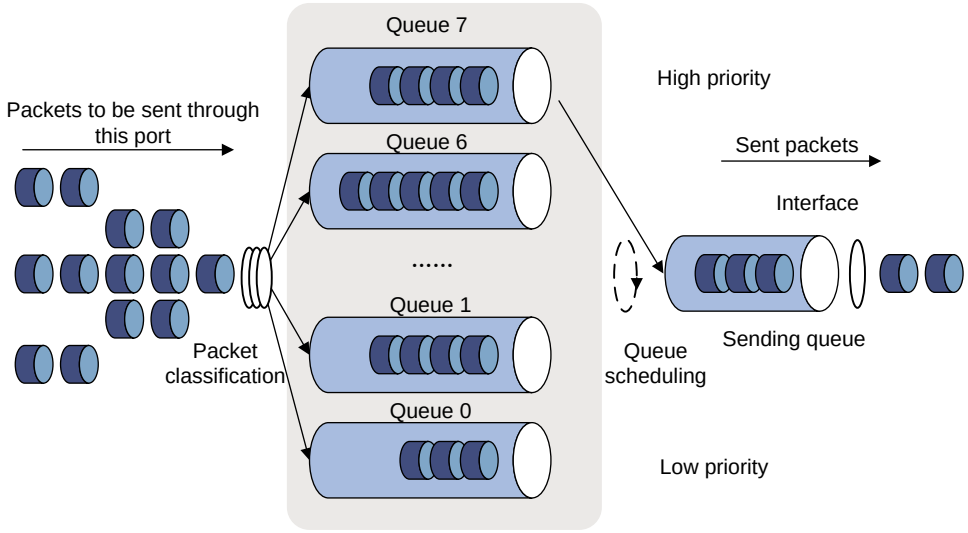
- Increased delay and jitter during packet transmission.
- Decreased network throughput and resource use efficiency.
- Network resource (memory, in particular) exhaustion and even system breakdown.

Congestion is unavoidable in switched networks and multiuser application environments. To improve the service performance of your network, take measures to manage and control it.

The key to congestion management is defining a resource dispatching policy to prioritize packets for forwarding when congestion occurs.

Congestion management methods

Congestion management uses queuing and scheduling algorithms to classify and sort traffic leaving a port.



The device supports the following queuing mechanisms:

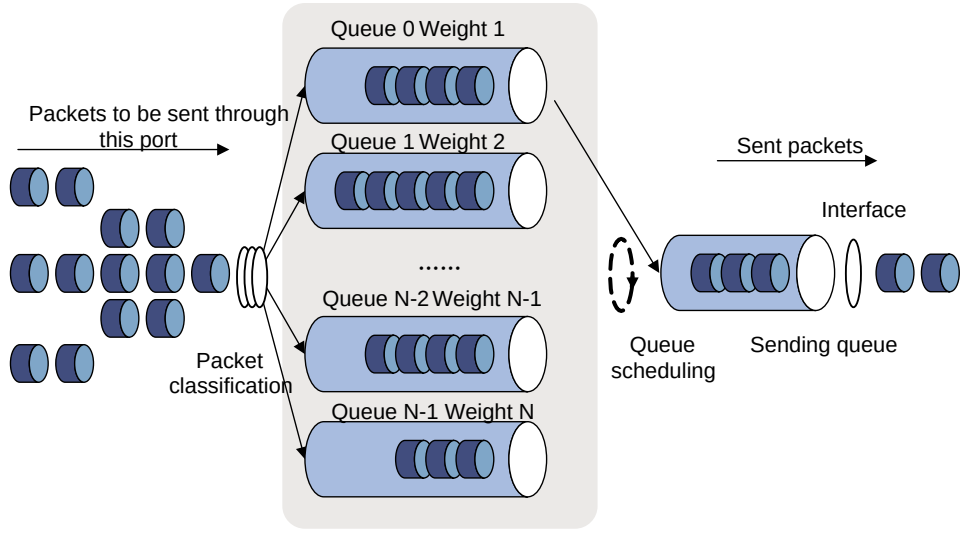
- SP.
- WRR.

SP queuing

SP queuing is designed for mission-critical applications that require preferential service to reduce the response delay when congestion occurs.

Figure 12 SP queuing

In Figure 12, SP queuing classifies eight queues on a port into eight classes, numbered 7 to 0 in descending priority order.



SP queuing schedules the eight queues in the descending order of priority. SP queuing sends packets in the queue with the highest priority first. When the queue with the highest priority is empty, it sends packets in the queue with the second highest priority, and so on. You can assign mission-critical packets to a high priority queue to make sure they are always served first. Common service packets can be assigned to low priority queues to be transmitted when high priority queues are empty.

The disadvantage of SP queuing is that packets in the lower priority queues cannot be transmitted if packets exist in the higher priority queues. In the worst case, lower priority traffic might never get serviced.

WRR queuing

WRR queuing schedules all the queues in turn to ensure that every queue is served for a certain time, as shown in Figure 13.

Figure 13 WRR queuing

Assume a port provides eight output queues. WRR assigns each queue a weight value (represented by w7, w6, w5, w4, w3, w2, w1, or w0). The weight value of a queue decides the proportion of resources assigned to the queue. On a 100 Mbps port, you can set the weight values to 50, 30, 10, 10, 50, 30, 10, and 10 for w7 through w0. In this way, the queue with the lowest priority can get a minimum of 5 Mbps of bandwidth. WRR solves the problem that SP queuing might fail to serve packets in low-priority queues for a long time.

Another advantage of WRR queuing is that when the queues are scheduled in turn, the service time for each queue is not fixed. If a queue is empty, the next queue will be scheduled immediately. This improves bandwidth resource use efficiency.

WRR queuing includes the following types:

- **Basic WRR queuing**—Contains multiple queues. You can set the weight for each queue, and WRR schedules these queues based on the user-defined parameters in a round robin manner.
- **Group-based WRR queuing**—All the queues are scheduled by WRR. You can divide output queues to WRR priority queue group 1 and WRR priority queue group 2. Round robin queue scheduling is performed for group 1 first. If group 1 is empty, round robin queue scheduling is performed for group 2. Only WRR priority queue group 1 is supported in the current software version.

On an interface enabled with group-based WRR queuing, you can assign queues to the SP group. Queues in the SP group are scheduled with SP. The SP group has higher scheduling priority than the WRR groups.

Congestion management tasks at a glance

To configure congestion management, perform the following tasks:

3. Configuring queuing on an interface
   - Configuring SP queuing
   - Configuring WRR queuing
   - Configuring SP+WRR queuing
4. Configuring a queue scheduling profile

Configuring queuing on an interface

Restrictions and guidelines for queuing configuration

The term "interface" in this section collectively refers to Layer 2 Ethernet interfaces.

Configuring SP queuing

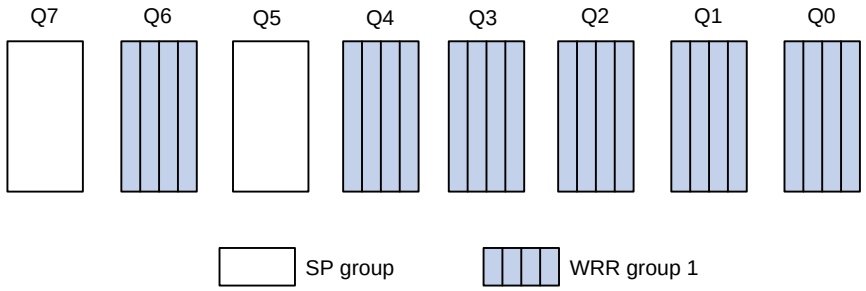
1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure SP queuing.
   qos sp
   By default, an interface uses packet-count WRR queuing.

Configuring WRR queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable WRR queuing.
   qos wrr weight
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to a WRR group, and configure scheduling parameters for the queue.
   qos wrr *queue-id* **group 1 weight** *schedule-value*
   By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring SP+WRR queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable byte-count or packet-count WRR queuing.
   qos wrr weight
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to the SP group.
   qos wrr *queue-id* **group sp**
   By default, all queues are in WRR group 1.
5. Assign a queue to a WRR group, and configure a scheduling weight for the queue.
   qos wrr *queue-id* **group 1 weight** *schedule-value*
   By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.



Configuring a queue scheduling profile

About queue scheduling profiles

In a queue scheduling profile, you can configure scheduling parameters for each queue. By applying the queue scheduling profile to an interface or session group profile, you can implement congestion management on the interface or session group profile.

Queue scheduling profiles support two queue scheduling algorithms: SP and WRR. In a queue scheduling profile, you can also configure SP+WRR. For information about each scheduling algorithm, see "About congestion management." When SP and WRR groups are configured in a queue scheduling profile, Figure 14 shows the scheduling order.

Figure 14 Queue scheduling profile configured with both SP and WRR

- Queue 7 has the highest priority in the SP group. Its packets are sent preferentially.
- Queue 5 has the second highest priority in the SP group. Packets in queue 5 are sent when queue 7 is empty.
- All queues in WRR group 1 are scheduled according to their weights. When queue 7 and queue 5 are empty, WRR group 1 is scheduled.

Restrictions and guidelines for queue scheduling profile configuration

When you configure a queue scheduling profile, follow these restrictions and guidelines:

- The term "interface" in this section refers to Layer 2 Ethernet interfaces.
- Only one queue scheduling profile can be applied to an interface or session group profile.
- You can modify the scheduling parameters in a queue scheduling profile already applied to an interface, the switching fabric module, or a session group profile.

Configuring a queue scheduling profile

1. Enter system view.
   system-view
2. Create a queue scheduling profile and enter queue scheduling profile view.
   qos qmprofile *profile-name*
3. (Optional.) Configure queue scheduling parameters.
   - Configure a queue to use SP.
     queue *queue-id* **sp**
   - Configure a queue to use WRR.
     queue *queue-id* **wrr group** *group-id* **weight** *schedule-value*

   By default, all queues in a queue scheduling profile are SP queues.

Applying a queue scheduling profile

1. Enter system view.
   system-view
2. Execute the following commands in sequence to apply the queue scheduling profile to the outbound direction of an interface:
   interface *interface-type interface-number*
   qos apply qmprofile *profile-name*

By default, no queue scheduling profile is applied to an interface.

Example: Configuring a queue scheduling profile

Network configuration

Configure a queue scheduling profile to meet the following requirements on GigabitEthernet 1/0/1:

- Queue 7 has the highest priority, and its packets are sent preferentially.
- Queue 0 through queue 6 are in the WRR group and are scheduled according to their packet-count weights, which are 2, 1, 2, 4, 6, 8, and 10, respectively. When queue 7 is empty, the WRR group is scheduled.

Procedure

Enter system view.

```
<Sysname> system-view
```

Create a queue scheduling profile named **qm1**.

```
[Sysname] qos qmprofile qm1
[Sysname-qmprofile-qm1]
```

Configure queue 7 to use SP queuing.

```
[Sysname-qmprofile-qm1] queue 7 sp
```

Assign queue 0 through queue 6 to WRR group 1, with their packet-count weights as 2, 1, 2, 4, 6, 8, and 10, respectively.

```
[Sysname-qmprofile-qm1] queue 0 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 1 wrr group 1 weight 1
[Sysname-qmprofile-qm1] queue 2 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 3 wrr group 1 weight 4
[Sysname-qmprofile-qm1] queue 4 wrr group 1 weight 6
[Sysname-qmprofile-qm1] queue 5 wrr group 1 weight 8
[Sysname-qmprofile-qm1] queue 6 wrr group 1 weight 10
[Sysname-qmprofile-qm1] quit
```

Apply queue scheduling profile **qm1** to GigabitEthernet 1/0/1.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos apply qmprofile qm1
```

After the configuration is completed, GigabitEthernet 1/0/1 performs queue scheduling as specified in queue scheduling profile **qm1**.

Display and maintenance commands for congestion management

Execute **display** commands in any view.

Task	Command
Display the configuration of queue scheduling profiles.	**display qos qmprofile configuration** [*profile-name*] [**slot** *slot-number*]
Display the queue scheduling profiles applied to interfaces.	**display qos qmprofile interface** [*interface-type interface-number*]

Task	Command
Display outbound queue-based traffic statistics for interfaces.	**display qos queue-statistics interface outbound**
Display SP queuing configuration.	**display qos queue sp interface** [*interface-type interface-number*]
Display WRR queuing configuration.	**display qos queue wrr interface** [*interface-type interface-number*]

Configuring traffic filtering

About traffic filtering

You can filter in or filter out traffic of a class by associating the class with a traffic filtering action. For example, you can filter packets sourced from an IP address according to network status.

Restrictions and guidelines: Traffic filtering configuration

A traffic filtering action takes effect only when a QoS policy is applied to the following application destinations:

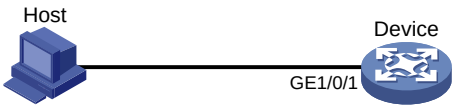
- Interface.
- VLANs.
- Globally.
- Control plane.
- User profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure the traffic filtering action.
      filter { **deny** | **permit** }
      By default, no traffic filtering action is configured.
      If a traffic behavior has the **filter deny** action, all other actions in the traffic behavior except class-based accounting do not take effect.
      If the **filter permit** command is configured in a traffic behavior, the permitted packets can be processed by other class-behavior associations in the same QoS policy.
   c. Return to system view.

quit

4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display the traffic filtering configuration.
   display traffic behavior user-defined [*behavior-name*]
   This command is available in any view.



Traffic filtering configuration examples

Example: Configuring traffic filtering

Network configuration

As shown in Figure 15, configure traffic filtering on GigabitEthernet 1/0/1 to deny the incoming packets with destination port number 21.

Figure 15 Network diagram

Procedure

Create advanced ACL 3000, and configure a rule to match packets whose destination port number is 21.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 permit tcp destination-port eq 21
[Device-acl-ipv4-adv-3000] quit
```

Create a traffic class named **classifier_1**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 3000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the traffic filtering action to drop packets.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] filter deny
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Configuring protocol packet rate limiting

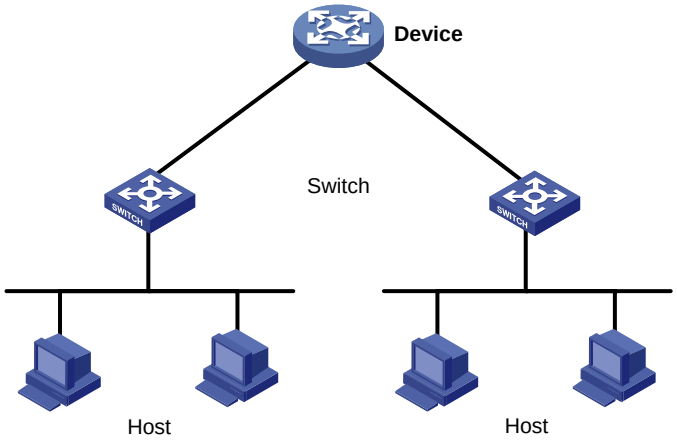
About protocol packet rate limiting

The protocol packet processing rate of a CPU is limited. When a large number of protocol packets are sent to the CPU, the CPU might be occupied by the protocol packets and cannot process other tasks. The protocol packet rate limiting feature limits the rate of protocol packets sent to the CPU, and it guarantees the normal operation of the CPU.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criteria are configured.
      For more information, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure protocol packet rate limiting.
      packet-rate { *value* | **attack-defense-threshold** *threshold-value* } *
      By default, protocol packet rate limiting is not configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a class is not associated with any behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy to a control plane.
   For more information, see "Applying the QoS policy to a control plane."
   By default, no QoS policy is applied to a control plane.

6. (Optional.) Display the protocol packet rate limiting configuration.
   display traffic behavior user-defined [*behavior-name*]
   This command is available in any view.



Protocol packet rate limiting configuration examples

Example: Configuring protocol packet rate limiting

Network configuration

As shown in Figure 16, limit the rate of DHCP protocol packets sent to the CPU of the device to 500 pps.

Figure 16 Network diagram

Procedure

Create a traffic class named **classifier_1** and configure the class to match DHCP protocol packets.

```
<Device> system-view
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match control-plane protocol dhcp
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1** and configure the behavior to limit the packet rate to 500 pps.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] packet-rate 500
[Device-behavior-behavior_1] quit
```

Create a QoS policy named and associate class **classifier_1** with behavior **behavior_1** in the policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the control plane.

```
[Device] control-plane slot 1
[Device-cp] qos apply policy policy inbound
```

```
[Device-cp] quit
```

Configuring priority marking

About priority marking

Priority marking sets the priority fields or flag bits of packets to modify the priority of packets. For example, you can use priority marking to set IP precedence or DSCP for a class of IP packets to control the forwarding of these packets.

To configure priority marking to set the priority fields or flag bits for a class of packets, perform the following tasks:

1. Configure a traffic behavior with a priority marking action.
2. Associate the traffic class with the traffic behavior.

Priority marking can be used together with priority mapping. For more information, see "Configuring priority mapping."

Configuring priority marking

Restrictions and guidelines

The device supports the following application destinations for priority marking:

- Interface.
- VLANs.
- Globally.
- Control plane.
- User profile.

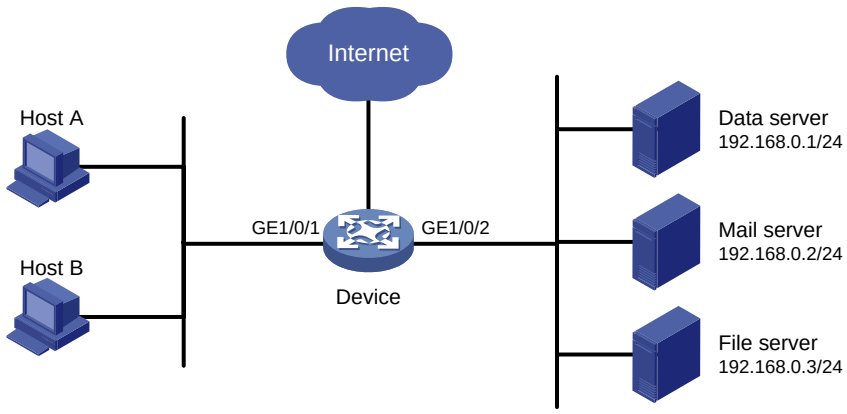
Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a priority marking action.
      For configurable priority marking actions, see the **remark** commands in *ACL and QoS Command Reference*.
   c. Return to system view.

quit

4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display the priority marking configuration.
   display traffic behavior user-defined [*behavior-name*]
   This command is available in any view.

Priority marking configuration examples



Example: Configuring priority marking

Network configuration

As shown in Figure 17, configure priority marking on the device to meet the following requirements:

Traffic source	Destination	Processing priority
Host A, B	Data server	High
Host A, B	Mail server	Medium
Host A, B	File server	Low

Figure 17 Network diagram

Procedure

Create advanced ACL 3000, and configure a rule to match packets with destination IP address 192.168.0.1.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

Create advanced ACL 3001, and configure a rule to match packets with destination IP address 192.168.0.2.

```
[Device] acl advanced 3001
[Device-acl-ipv4-adv-3001] rule permit ip destination 192.168.0.2 0
[Device-acl-ipv4-adv-3001] quit
```

Create advanced ACL 3002, and configure a rule to match packets with destination IP address 192.168.0.3.

```
[Device] acl advanced 3002
[Device-acl-ipv4-adv-3002] rule permit ip destination 192.168.0.3 0
[Device-acl-ipv4-adv-3002] quit
```

Create a traffic class named **classifier_dbserver**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_dbserver
[Device-classifier-classifier_dbserver] if-match acl 3000
[Device-classifier-classifier_dbserver] quit
```

Create a traffic class named **classifier_mserver**, and use ACL 3001 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_mserver
[Device-classifier-classifier_mserver] if-match acl 3001
[Device-classifier-classifier_mserver] quit
```

Create a traffic class named **classifier_fserver**, and use ACL 3002 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_fserver
[Device-classifier-classifier_fserver] if-match acl 3002
[Device-classifier-classifier_fserver] quit
```

Create a traffic behavior named **behavior_dbserver**, and configure the action of setting the local precedence value to 4.

```
[Device] traffic behavior behavior_dbserver
[Device-behavior-behavior_dbserver] remark local-precedence 4
[Device-behavior-behavior_dbserver] quit
```

Create a traffic behavior named **behavior_mserver**, and configure the action of setting the local precedence value to 3.

```
[Device] traffic behavior behavior_mserver
[Device-behavior-behavior_mserver] remark local-precedence 3
[Device-behavior-behavior_mserver] quit
```

Create a traffic behavior named **behavior_fserver**, and configure the action of setting the local precedence value to 2.

```
[Device] traffic behavior behavior_fserver
[Device-behavior-behavior_fserver] remark local-precedence 2
[Device-behavior-behavior_fserver] quit
```

Create a QoS policy named **policy_server**, and associate traffic classes with traffic behaviors in the QoS policy.

```
[Device] qos policy policy_server
```

```
[Device-qospolicy-policy_server] classifier classifier_dbserver behavior
behavior_dbserver
[Device-qospolicy-policy_server] classifier classifier_mserver behavior
behavior_mserver
[Device-qospolicy-policy_server] classifier classifier_fserver behavior
behavior_fserver
[Device-qospolicy-policy_server] quit
```

Apply QoS policy **policy_server** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy_server inbound
[Device-GigabitEthernet1/0/1] quit
```

Configuring nesting

About nesting

Nesting adds a VLAN tag to the matching packets to allow the VLAN-tagged packets to pass through the corresponding VLAN. For example, you can add an outer VLAN tag to packets from a customer network to a service provider network. This allows the packets to pass through the service provider network by carrying a VLAN tag assigned by the service provider.

Restrictions and guidelines: Nesting configuration

The device supports the following application destinations in the inbound direction for nesting:

- Interface.
- VLANs.
- Globally.

When you configure the match criteria for a nesting action, you must use the **if-match customer-vlan-id** command to match packets carrying a single layer of VLAN tags. Then, the nesting action can add an outer VLAN tag to packets.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an outer VLAN tag adding action.
      nest top-most vlan *vlan-id*
      By default, no outer VLAN tag adding action is configured for a traffic behavior.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

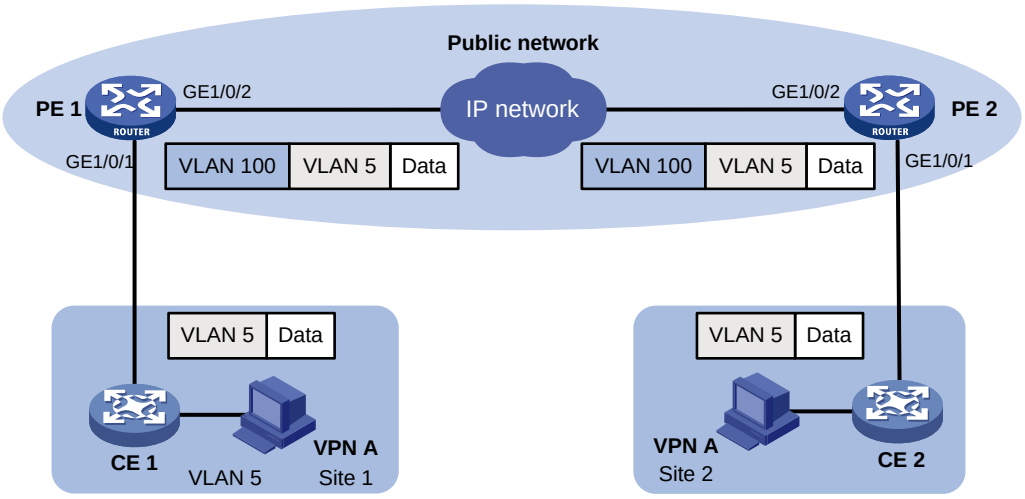
6. (Optional.) Display the nesting configuration.

display traffic behavior user-defined [*behavior-name*]

This command is available in any view.

Nesting configuration examples

Example: Configuring nesting



Network configuration

As shown in Figure 18:

- Site 1 and Site 2 in VPN A are two branches of a company. They use VLAN 5 to transmit traffic.
- Because Site 1 and Site 2 are located in different areas, the two sites use the VPN access service of a service provider. The service provider assigns VLAN 100 to the two sites.

Configure nesting, so that the two branches can communicate through the service provider network.

Figure 18 Network diagram

Procedure

1. Configuring PE 1:

Create a traffic class named **test** to match traffic with VLAN ID 5.

```
<PE1> system-view
[PE1] traffic classifier test
[PE1-classifier-test] if-match customer-vlan-id 5
```

```
[PE1-classifier-test] quit
```

Configure an action to add outer VLAN tag 100 in traffic behavior **test**.

```
[PE1] traffic behavior test
[PE1-behavior-test] nest top-most vlan 100
[PE1-behavior-test] quit
```

Create a QoS policy named **test**, and associate class **test** with behavior **test** in the QoS policy.

```
[PE1] qos policy test
[PE1-qospolicy-test] classifier test behavior test
[PE1-qospolicy-test] quit
```

Configure the downlink port (GigabitEthernet 1/0/1) as a hybrid port, and assign the port to VLAN 100 as an untagged member.

```
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-type hybrid
[PE1-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Apply QoS policy **test** to the incoming traffic of GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qos apply policy test inbound
[PE1-GigabitEthernet1/0/1] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a trunk port, and assign it to VLAN 100.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100
[PE1-GigabitEthernet1/0/2] quit
```

2. Configuring PE 2:

Configure PE 2 in the same way PE 1 is configured.

Configuring traffic redirecting

About traffic redirecting

Traffic redirecting redirects packets matching the specified match criteria to a location for processing.

You can redirect packets to the following destinations:

- CPU.
- Interface.

Restrictions and guidelines: Traffic redirecting configuration

- The device supports the following application destinations in the inbound direction for traffic redirecting:
  - Interface.
  - VLANs.
  - Globally.
  - Control plane.
  - User profile.
- If you execute the **redirect** command multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic redirecting action.
      redirect { **cpu** | **interface** *interface-type interface-number* }

By default, no traffic redirecting action is configured for a traffic behavior.

c. Return to system view.

quit

4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display traffic redirecting configuration.

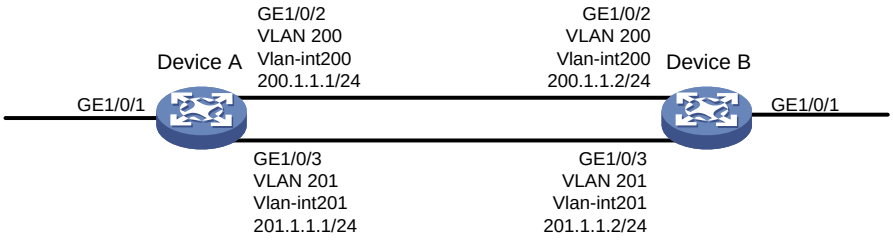
display traffic behavior user-defined [*behavior-name*]

This command is available in any view.

Traffic redirecting configuration examples

Example: Configuring traffic redirecting

Network configuration



As shown in Figure 19:

- Device A is connected to Device B through two links. Device A and Device B are each connected to other devices.
- GigabitEthernet 1/0/1 of Device A is a trunk port and belongs to VLAN 200 and VLAN 201.
- GigabitEthernet 1/0/2 of Device A and GigabitEthernet 1/0/2 of Device B belong to VLAN 200.
- GigabitEthernet 1/0/3 of Device A and GigabitEthernet 1/0/3 of Device B belong to VLAN 201.
- On Device A, the IP address of VLAN-interface 200 is 200.1.1.1/24, and that of VLAN-interface 201 is 201.1.1.1/24.
- On Device B, the IP address of VLAN-interface 200 is 200.1.1.2/24, and that of VLAN-interface 201 is 201.1.1.2/24.

Configure the actions of redirecting traffic to an interface to meet the following requirements:

- Packets with source IP address 2.1.1.1 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/2.
- Packets with source IP address 2.1.1.2 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/3.
- Other packets received on GigabitEthernet 1/0/1 of Device A are forwarded according to the routing table.

Figure 19 Network diagram

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 2.1.1.1.

```
<DeviceA> system-view
[DeviceA] acl basic 2000
[DeviceA-acl-ipv4-basic-2000] rule permit source 2.1.1.1 0
[DeviceA-acl-ipv4-basic-2000] quit
```

Create basic ACL 2001, and configure a rule to match packets with source IP address 2.1.1.2.

```
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 2.1.1.2 0
[DeviceA-acl-ipv4-basic-2001] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_1
[DeviceA-classifier-classifier_1] if-match acl 2000
[DeviceA-classifier-classifier_1] quit
```

Create a traffic class named **classifier_2**, and use ACL 2001 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_2
[DeviceA-classifier-classifier_2] if-match acl 2001
[DeviceA-classifier-classifier_2] quit
```

Create a traffic behavior named **behavior_1**, and configure the action of redirecting traffic to GigabitEthernet 1/0/2.

```
[DeviceA] traffic behavior behavior_1
[DeviceA-behavior-behavior_1] redirect interface gigabitethernet 1/0/2
[DeviceA-behavior-behavior_1] quit
```

Create a traffic behavior named **behavior_2**, and configure the action of redirecting traffic to GigabitEthernet 1/0/3.

```
[DeviceA] traffic behavior behavior_2
[DeviceA-behavior-behavior_2] redirect interface gigabitethernet 1/0/3
[DeviceA-behavior-behavior_2] quit
```

Create a QoS policy named **policy**.

```
[DeviceA] qos policy policy
```

Associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_1 behavior behavior_1
```

Associate traffic class **classifier_2** with traffic behavior **behavior_2** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_2 behavior behavior_2
[DeviceA-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy policy inbound
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring global CAR

About global CAR

Global committed access rate (CAR) is an approach to policing traffic flows globally. It adds flexibility to common CAR where traffic policing is performed only on a per-traffic class or per-interface basis. In this approach, CAR actions are created in system view and each can be used to police multiple traffic flows as a whole.

Aggregate CAR

An aggregate CAR action is created globally. It can be directly applied to interfaces or used in the traffic behaviors associated with different traffic classes to police multiple traffic flows as a whole. The total rate of the traffic flows must conform to the traffic policing specifications set in the aggregate CAR action.

Configuring aggregate CAR

1. Enter system view.

   system-view

2. Define a traffic class.

   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]

   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

      For configurable match criteria, see the **if-match** command in *ACL and QoS Command Reference*.

   c. Return to system view.

      quit

3. Configure an aggregate CAR action.

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

   By default, no aggregate CAR action is configured.

4. Define a traffic behavior.

   a. Enter traffic behavior view.

      traffic behavior *behavior-name*

   b. Use the aggregate CAR in the traffic behavior.

      car name *car-name*

      By default, no aggregate CAR action is used in a traffic behavior.

5. Apply the QoS policy.

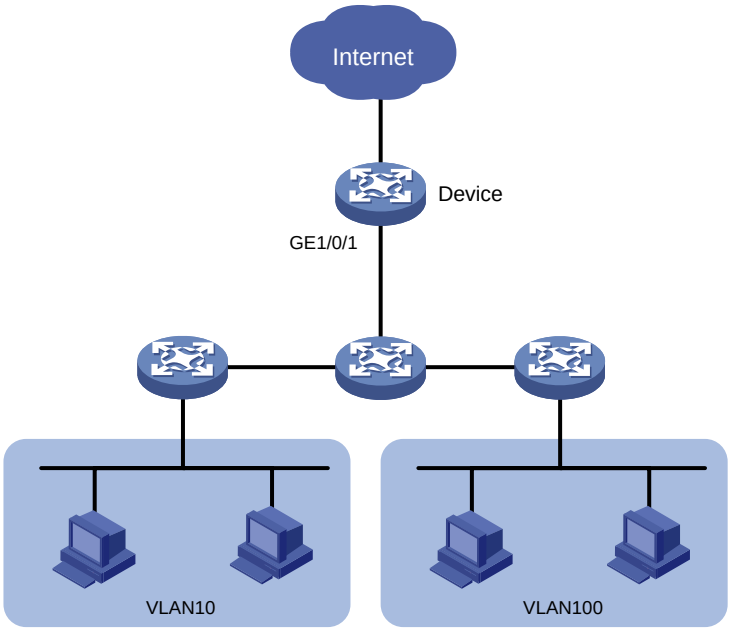
For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

Display and maintenance commands for global CAR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display statistics for global CAR actions.	**display qos car name** [*car-name*]
Clear statistics for global CAR actions.	**reset qos car name** [*car-name*]



Global CAR configuration examples

Example: Configuring MQC aggregate CAR

Network configuration

As shown in Figure 20, configure MQC aggregate CAR to limit the total rate of traffic in VLAN 10 and VLAN 100 to CIR 2560 kbps and CBS 20480 bytes and drop the exceeding packets.

Figure 20 Network diagram

Procedure

Configure an aggregate CAR action according to the rate limit requirements.

```
<Device> system-view
[Device] qos car aggcar-1 aggregative cir 2560 cbs 20480 red discard
```

Create traffic class 1, and use VLAN ID 10 as the match criterion in the traffic class.

```
[Device] traffic classifier 1
[Device-classifier-1] if-match service-vlan-id 10
[Device-classifier-1] quit
```

Create traffic behavior 1, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 1
[Device-behavior-1] car name aggcar-1
[Device-behavior-1] quit
```

Create traffic class 2, and use VLAN ID 100 as the match criterion in the traffic class.

```
[Device] traffic classifier 2
[Device-classifier-2] if-match service-vlan-id 100
[Device-classifier-2] quit
```

Create traffic behavior 2, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 2
[Device-behavior-2] car name aggcar-1
[Device-behavior-2] quit
```

Create a QoS policy named **car**, and associate traffic classes 1 and 2 with traffic behaviors 1 and 2 in the QoS policy, respectively.

```
[Device] qos policy car
[Device-qospolicy-car] classifier 1 behavior 1
[Device-qospolicy-car] classifier 2 behavior 2
[Device-qospolicy-car] quit
```

Apply QoS policy **car** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy car inbound
[Device-GigabitEthernet1/0/1] quit
```

Configuring class-based accounting

About class-based accounting

Class-based accounting collects statistics on a per-traffic class basis. For example, you can define the action to collect statistics for traffic sourced from a certain IP address. By analyzing the statistics, you can determine whether anomalies have occurred and what action to take.

Restrictions and guidelines: Class-based accounting configuration

A class-based accounting action takes effect only when a QoS policy is applied to the following application destinations:

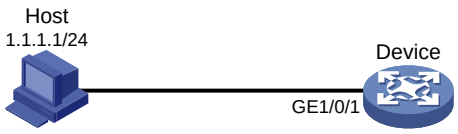
- Interface.
- VLANs.
- Globally.
- Control plane.
- User profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an accounting action.
      accounting [**byte** | **packet**]
      By default, no traffic accounting action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.
   qos policy *policy-name*
b. Associate the traffic class with the traffic behavior in the QoS policy.
   classifier *classifier-name* **behavior** *behavior-name*
   By default, a traffic class is not associated with a traffic behavior.
c. Return to system view.
   quit

5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display the class-based accounting configuration.
   display traffic behavior user-defined [*behavior-name*]



Class-based accounting configuration examples

Example: Configuring class-based accounting

Network configuration

As shown in Figure 21, configure class-based accounting on GigabitEthernet 1/0/1 to collect statistics for incoming traffic from 1.1.1.1/24.

Figure 21 Network diagram

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 1.1.1.1.

```
<Device> system-view
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Device-acl-ipv4-basic-2000] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 2000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the class-based accounting action.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] accounting packet
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
```

```
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Display traffic statistics to verify the configuration.

```
[Device] display qos policy interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: policy
   Classifier: classifier_1
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: behavior_1
      Accounting enable:
        28529 (Packets)
```

Appendixes

Appendix A Acronyms

Table 2 Appendix A Acronyms

Acronym	Full spelling
AF	Assured Forwarding
BE	Best Effort
BQ	Bandwidth Queuing
CAR	Committed Access Rate
CBS	Committed Burst Size
CBQ	Class Based Queuing
CE	Congestion Experienced
CIR	Committed Information Rate
CQ	Custom Queuing
DCBX	Data Center Bridging Exchange Protocol
DiffServ	Differentiated Service
DSCP	Differentiated Services Code Point
EBS	Excess Burst Size
ECN	Explicit Congestion Notification
EF	Expedited Forwarding
FIFO	First in First out
FQ	Fair Queuing
GMB	Guaranteed Minimum Bandwidth
GTS	Generic Traffic Shaping
INT	Inband Network Telemetry
IntServ	Integrated Service
ISP	Internet Service Provider
LLQ	Low Latency Queuing
LSP	Label Switched Path
MPLS	Multiprotocol Label Switching
PE	Provider Edge
PIR	Peak Information Rate
PQ	Priority Queuing
PW	Pseudowire
QoS	Quality of Service
QPPB	QoS Policy Propagation Through the Border Gateway Protocol

Acronym	Full spelling
RED	Random Early Detection
RSVP	Resource Reservation Protocol
RTP	Real-Time Transport Protocol
SP	Strict Priority
ToS	Type of Service
VoIP	Voice over IP
VPN	Virtual Private Network
WFQ	Weighted Fair Queuing
WRED	Weighted Random Early Detection
WRR	Weighted Round Robin

Appendix B Default priority maps

For the default **dscp-dscp** priority map, an input value yields a target value equal to it.

Table 3 Default dot1p-lp priority map

Input priority value	dot1p-lp map

Appendix C Introduction to packet precedence

IP precedence and DSCP values

Figure 22 ToS and DS fields

As shown in Figure 22, the ToS field in the IP header contains 8 bits. The first 3 bits (0 to 2) represent IP precedence from 0 to 7. According to RFC 2474, the ToS field is redefined as the differentiated services (DS) field. A DSCP value is represented by the first 6 bits (0 to 5) of the DS field and is in the range 0 to 63. The remaining 2 bits (6 and 7) are reserved.

Table 6 IP precedence

IP precedence (decimal)	IP precedence (binary)	Description
0	000	Routine
1	001	priority
2	010	immediate
3	011	flash
4	100	flash-override
5	101	critical

IP precedence (decimal)	IP precedence (binary)	Description
6	110	internet
7	111	network

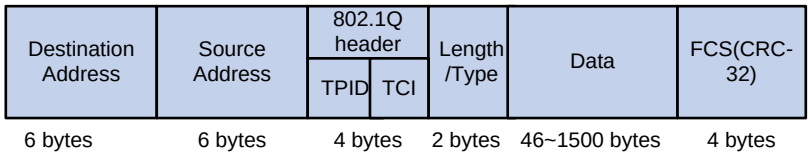

Table 7 DSCP values

DSCP value (decimal)	DSCP value (binary)	Description
46	101110	ef
10	001010	af11

40	101000	cs5
48	110000	cs6
56	111000	cs7
0	000000	be (default)

802.1p priority

802.1p priority lies in the Layer 2 header. It applies to occasions where Layer 3 header analysis is not needed and QoS must be assured at Layer 2.

Figure 23 An Ethernet frame with an 802.1Q tag header

As shown in Figure 23, the 4-byte 802.1Q tag header contains the 2-byte tag protocol identifier (TPID) and the 2-byte tag control information (TCI). The value of the TPID is 0x8100. Figure 24 shows the format of the 802.1Q tag header. The Priority field in the 802.1Q tag header is called 802.1p priority, because its use is defined in IEEE 802.1p. Table 8 shows the values for 802.1p priority.

Figure 24 802.1Q tag header

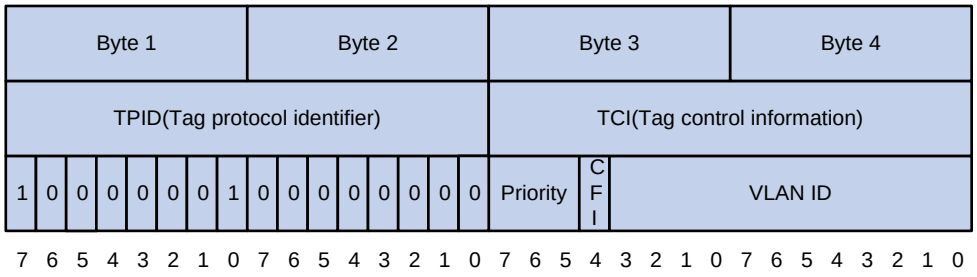

Table 8 Description on 802.1p priority

802.1p priority (decimal)	802.1p priority (binary)	Description
0	000	best-effort
1	001	background
2	010	spare

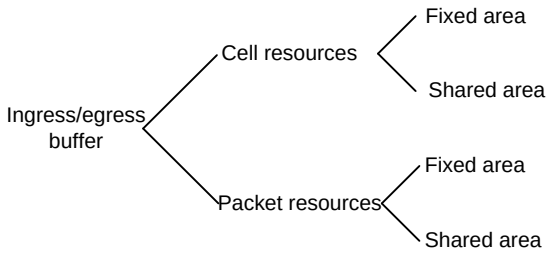
Configuring data buffers

About data buffers

Data buffer types



Data buffers temporarily store packets to avoid packet loss.

The following data buffers are available:

- **Ingress buffer**—Stores incoming packets when the CPU is busy.
- **Egress buffer**—Stores outgoing packets when network congestion occurs.

Figure 1 shows the structure of ingress and egress buffers.

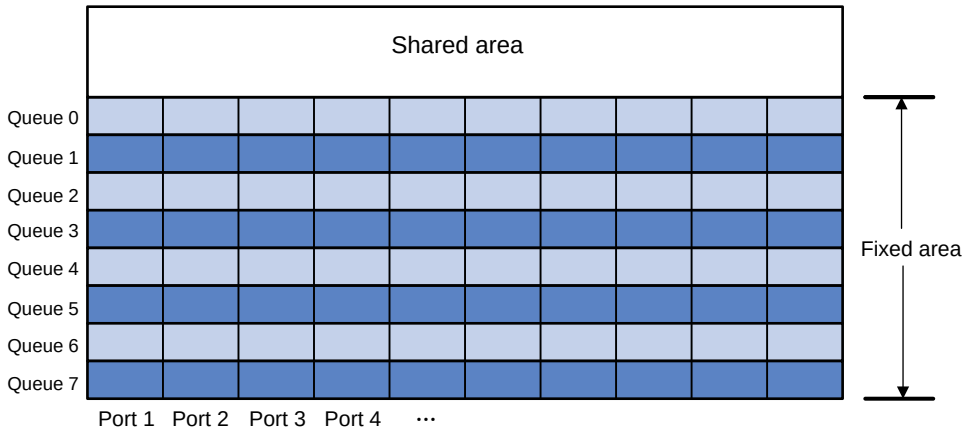
Figure 1 Data buffer structure

Cell resources and packet resources

A buffer uses the following types of resources:

- **Cell resources**—Store packets. The buffer uses cell resources based on packet sizes. Suppose a cell resource provides 208 bytes. The buffer allocates one cell resource to a 128-byte packet and two cell resources to a 300-byte packet.
- **Packet resources**—Store packet pointers. A packet pointer indicates where the packet is located in cell resources. The buffer uses one packet resource for each incoming or outgoing packet.

Fixed area and shared area



Each type of resources has a fixed area and a shared area.

- **Fixed area**—Partitioned into queues, each of which is equally divided by all the interfaces on the switch. When congestion occurs or the CPU is busy, the following rules apply:
  a. An interface first uses the relevant queues of the fixed area to store packets.
  b. When a queue is full, the interface uses the corresponding queue of the shared area.
  c. When the queue in the shared area is also full, the interface discards subsequent packets.

  The system allocates the fixed area among queues as specified by the user. Even if a queue is not full, other queues cannot preempt its space. Similarly, the share of a queue for an interface cannot be preempted by other interfaces even if it is not full.
- **Shared area**—Partitioned into queues, each of which is not equally divided by the interfaces. The system determines the actual shared-area space for each queue according to user configuration and the number of packets actually received and sent. If a queue is not full, other queues can preempt its space.

The system puts packets received or sent on all interfaces into a queue in the order they arrive. When the queue is full, subsequent packets are dropped.

Figure 1 Fixed area and shared area

Restrictions and guidelines: Data buffer configuration

You can configure data buffers either manually or automatically by enabling the Burst feature. If you have configured data buffers in one way, delete the configuration before using the other way. Otherwise, the new configuration does not take effect.

Inappropriate data buffer changes can cause system problems. Before manually changing data buffer settings, make sure you understand its impact on your device. As a best practice, use the **`burst-mode enable`** command if the system requires large buffer spaces.

Data buffer tasks at a glance

To configure the data buffer, perform the following tasks:

- Enabling the Burst feature
- Configuring data buffers manually

Enabling the Burst feature

About this task

The Burst feature enables the device to automatically allocate cell and packet resources. It is well suited to the following scenarios:

- Broadcast or multicast traffic is intensive, resulting in bursts of traffic.
- Traffic comes in and goes out in one of the following ways:
  - Enters a device from a high-speed interface and goes out of a low-speed interface.
  - Enters from multiple same-rate interfaces at the same time and goes out of an interface with the same rate.

Procedure

1. Enter system view.

system-view

2. Enable the Burst feature.

   burst-mode enable

   By default, the Burst feature is disabled.

Configuring data buffers manually

About this task

Each type of resources of a buffer, packet or cell, has a fixed size. After you set the shared-area size for a type of resources, the rest is automatically assigned to the fixed area.

Procedure

1. Enter system view.

   system-view

2. Configure buffer assignment rules. Choose the options to configure as needed:

   - Set the total shared-area ratio.

     buffer egress slot *slot-number* { **cell** | **packet** } **total-shared ratio** *ratio*

     If this command is not configured, you can display the default value by using the **display buffer** command.

3. Apply buffer assignment rules.

   buffer apply

   You cannot directly modify the applied configuration. To modify the configuration, you must cancel the application, reconfigure data buffers, and reapply the configuration.

Display and maintenance commands for data buffers

Execute **display** commands in any view.

Task	Command
Display buffer size settings.	**display buffer** [**slot** *slot-number*] [**queue** [*queue-id*]]
Display data buffer usage.	**display buffer usage** [**slot** *slot-number*]

Procedure 1
Display and maintenance commands for time ranges 1
Time range configuration examples 2
Example: Configuring a time range 2

Configuring time ranges

About time ranges

You can implement a service based on the time of the day by applying a time range to it. A time-based service takes effect only in time periods specified by the time range. For example, you can implement time-based ACL rules by applying a time range to them.

The following basic types of time ranges are available:

- **Periodic time range**—Recurs periodically on a day or days of the week.
- **Absolute time range**—Represents only a period of time and does not recur.

The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Restrictions and guidelines: Time range configuration

When you configure the ACL hardware mode, follow these restrictions and guidelines:

- If a time range does not exist, the service based on the time range does not take effect.
- You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements.

Procedure

1. Enter system view.

   system-view

2. Create or edit a time range.

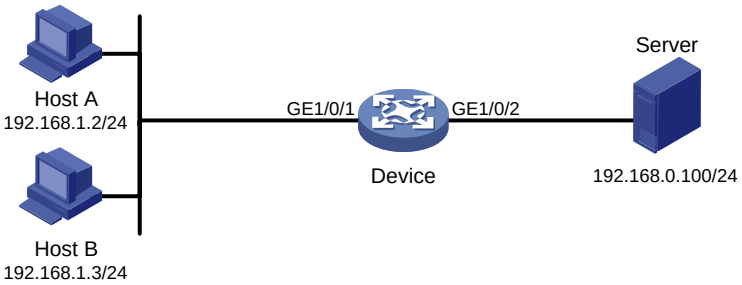
   time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

   If an existing time range name is provided, this command adds a statement to the time range.

Display and maintenance commands for time ranges

Execute the **display** command in any view.

Task	Command
Display time range configuration and status.	**display time-range** { *time-range-name* | **all** }



Time range configuration examples

Example: Configuring a time range

Network configuration

As shown in Figure 1, configure an ACL on the device to allow Host A to access the server only during 8:00 and 18:00 on working days from June 2015 to the end of the year.

Figure 1 Network diagram

Procedure

Create a periodic time range during 8:00 and 18:00 on working days from June 2015 to the end of the year.

```
<Device> system-view
[Device] time-range work 8:0 to 18:0 working-day from 0:0 6/1/2015 to 24:00 12/31/2015
```

Create an IPv4 basic ACL numbered 2001, and configure a rule in the ACL to permit packets only from 192.168.1.2/32 during the time range **work**.

```
[Device] acl basic 2001
[Device-acl-ipv4-basic-2001] rule permit source 192.168.1.2 0 time-range work
[Device-acl-ipv4-basic-2001] rule deny source any time-range work
[Device-acl-ipv4-basic-2001] quit
```

Apply IPv4 basic ACL 2001 to filter outgoing packets on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] packet-filter 2001 outbound
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the time range **work** is active on the device.

```
[Device] display time-range all
Current time is 13:58:35 6/19/2015 Friday

Time-range : work (Active)
 08:00 to 18:00 working-day
 from 00:00 6/1/2015 to 00:00 1/1/2016
```

Preface

This configuration guide covers security features.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

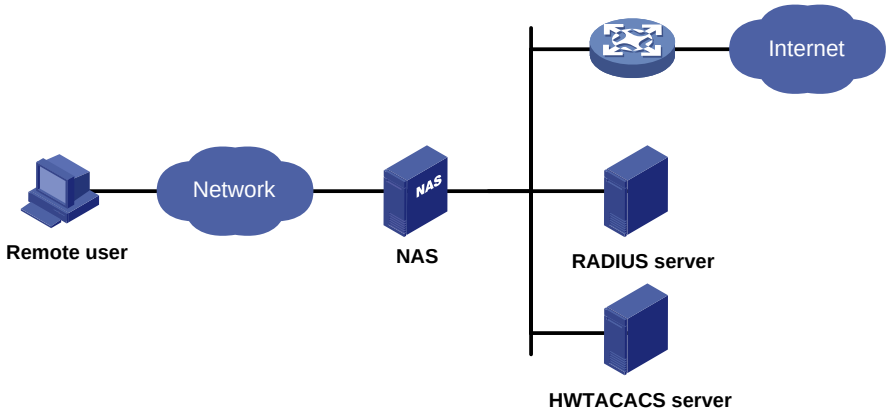
Configuring AAA

About AAA

AAA implementation



Authentication, Authorization, and Accounting (AAA) provides a uniform framework for implementing network access management. This feature specifies the following security functions:

- **Authentication**—Identifies users and verifies their validity.
- **Authorization**—Grants different users different rights, and controls the users' access to resources and services. For example, you can permit office users to read and print files and prevent guests from accessing files on the device.
- **Accounting**—Records network usage details of users, including the service type, start time, and traffic. This function enables time-based and traffic-based charging and user behavior auditing.

AAA network diagram

AAA uses a client/server model. The client runs on the access device, or the network access server (NAS), which authenticates user identities and controls user access. The server maintains user information centrally. See Figure 1.

Figure 1 AAA network diagram

To access networks or resources beyond the NAS, a user sends its identity information to the NAS. The NAS transparently passes the user information to AAA servers and waits for the authentication, authorization, and accounting result. Based on the result, the NAS determines whether to permit or deny the access request.

AAA has various implementations, including RADIUS, HWTACACS, and LDAP. RADIUS is most often used.

You can use different servers to implement different security functions. For example, you can use an HWTACACS server for authentication and authorization, and use a RADIUS server for accounting.

You can choose the security functions provided by AAA as needed. For example, if your company wants employees to be authenticated before they access specific resources, you would deploy an authentication server. If network usage information is needed, you would also configure an accounting server.

The device performs dynamic password authentication.

RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed information interaction protocol that uses a client/server model. The protocol can protect networks against unauthorized access and is often used in network environments that require both high security and remote user access.

The RADIUS authorization process is combined with the RADIUS authentication process, and user authorization information is piggybacked in authentication responses. RADIUS uses UDP port 1812 for authentication and UDP port 1813 for accounting.

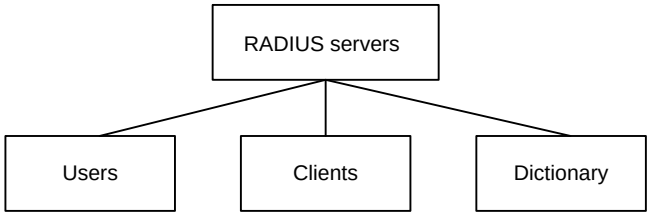
RADIUS was originally designed for dial-in user access, and has been extended to support additional access methods, such as Ethernet and ADSL.

Client/server model

The RADIUS client runs on the NASs located throughout the network. It passes user information to RADIUS servers and acts on the responses to, for example, reject or accept user access requests.

The RADIUS server runs on the computer or workstation at the network center and maintains information related to user authentication and network service access.

The RADIUS server operates using the following process:



1. Receives authentication, authorization, and accounting requests from RADIUS clients.
2. Performs user authentication, authorization, or accounting.
3. Returns user access control information (for example, rejecting or accepting the user access request) to the clients.

The RADIUS server can also act as the client of another RADIUS server to provide authentication proxy services.

The RADIUS server maintains the following databases:

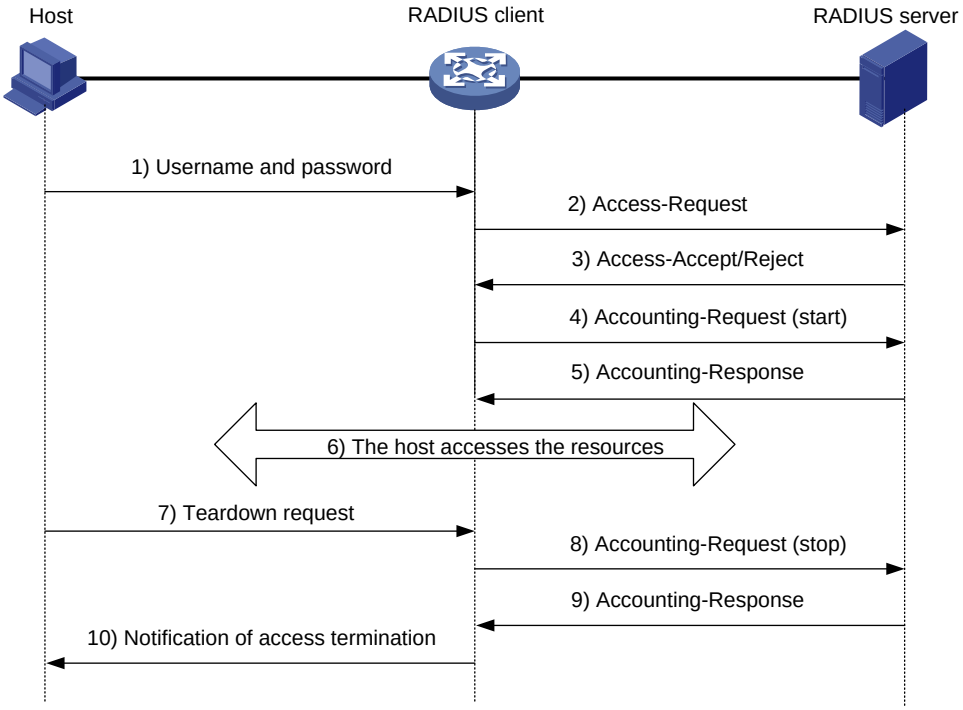
- **Users**—Stores user information, such as the usernames, passwords, applied protocols, and IP addresses.
- **Clients**—Stores information about RADIUS clients, such as shared keys and IP addresses.
- **Dictionary**—Stores RADIUS protocol attributes and their values.

Figure 2 RADIUS server databases

Information exchange security mechanism

The RADIUS client and server exchange information between them with the help of shared keys, which are preconfigured on the client and server. A RADIUS packet has a 16-byte field called Authenticator. This field includes a signature generated by using the MD5 algorithm, the shared key, and some other information. The receiver of the packet verifies the signature and accepts the packet only when the signature is correct. This mechanism ensures the security of information exchanged between the RADIUS client and server.

The shared keys are also used to encrypt user passwords that are included in RADIUS packets.



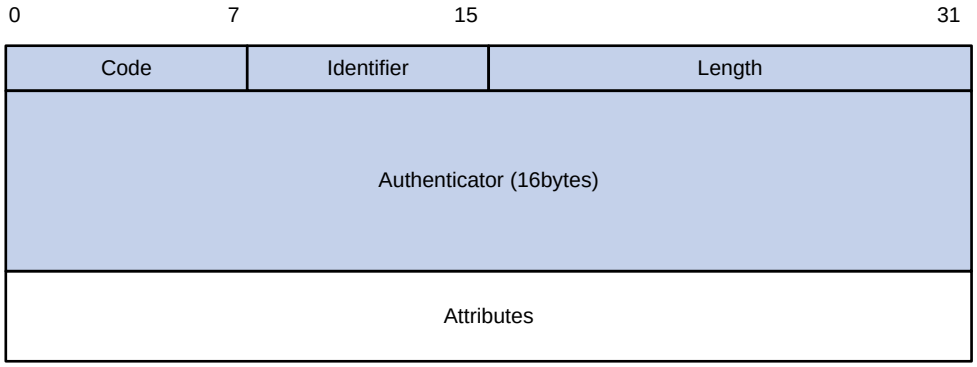
User authentication methods

The RADIUS server supports multiple user authentication methods, such as PAP, CHAP, and EAP.

Basic RADIUS packet exchange process

Figure 3 illustrates the interactions between a user host, the RADIUS client, and the RADIUS server.

Figure 3 Basic RADIUS packet exchange process



RADIUS uses in the following workflow:

1. The host sends a connection request that includes the user's username and password to the RADIUS client.
2. The RADIUS client sends an authentication request (Access-Request) to the RADIUS server. The request includes the user's password, which has been processed by the MD5 algorithm and shared key.
3. The RADIUS server authenticates the username and password. If the authentication succeeds, the server sends back an Access-Accept packet that contains the user's authorization information. If the authentication fails, the server returns an Access-Reject packet.
4. The RADIUS client permits or denies the user according to the authentication result. If the result permits the user, the RADIUS client sends a start-accounting request (Accounting-Request) packet to the RADIUS server.
5. The RADIUS server returns an acknowledgment (Accounting-Response) packet and starts accounting.
6. The user accesses the network resources.
7. The host requests the RADIUS client to tear down the connection.
8. The RADIUS client sends a stop-accounting request (Accounting-Request) packet to the RADIUS server.
9. The RADIUS server returns an acknowledgment (Accounting-Response) and stops accounting for the user.
10. The RADIUS client notifies the user of the termination.

RADIUS packet format

RADIUS uses UDP to transmit packets. The protocol also uses a series of mechanisms to ensure smooth packet exchange between the RADIUS server and the client. These mechanisms include the timer mechanism, the retransmission mechanism, and the backup server mechanism.

Figure 4 RADIUS packet format

Descriptions of the fields are as follows:

- The Code field (1 byte long) indicates the type of the RADIUS packet. Table 1 gives the main values and their meanings.

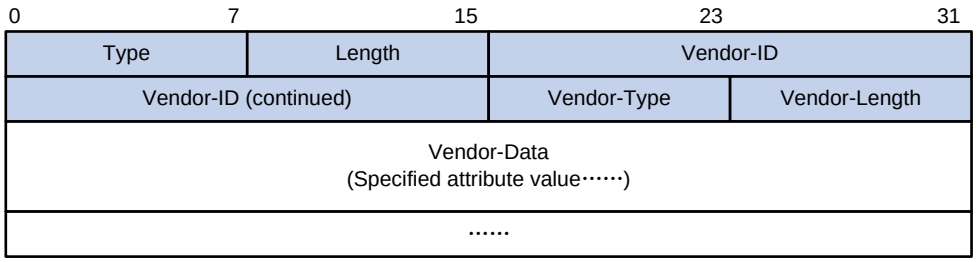
  Table 1 Main values of the Code field

Code	Packet type	Description
1	Access-Request	From the client to the server. A packet of this type includes user information for the server to authenticate the user. It must contain the User-Name attribute and can optionally contain the attributes of NAS-IP-Address, User-Password, and NAS-Port.
2	Access-Accept	From the server to the client. If all attribute values included in the Access-Request are acceptable, the authentication succeeds, and the server sends an Access-Accept response.
3	Access-Reject	From the server to the client. If any attribute value included in the Access-Request is unacceptable, the authentication fails, and the server sends an Access-Reject response.
4	Accounting-Request	From the client to the server. A packet of this type includes user information for the server to start or stop accounting for the user. The Acct-Status-Type attribute in the packet indicates whether to start or stop accounting.
5	Accounting-Response	From the server to the client. The server sends a packet of this type to notify the client that it has received the Accounting-Request and has successfully recorded the accounting information.

- The Identifier field (1 byte long) is used to match response packets with request packets and to detect duplicate request packets. The request and response packets of the same exchange process for the same purpose (such as authentication or accounting) have the same identifier.
- The Length field (2 bytes long) indicates the length of the entire packet (in bytes), including the Code, Identifier, Length, Authenticator, and Attributes fields. Bytes beyond this length are considered padding and are ignored by the receiver. If the length of a received packet is less than this length, the packet is dropped.
- The Authenticator field (16 bytes long) is used to authenticate responses from the RADIUS server and to encrypt user passwords. There are two types of authenticators: request authenticator and response authenticator.

- The Attributes field (variable in length) includes authentication, authorization, and accounting information. This field can contain multiple attributes, each with the following subfields:
  - **Type**—Type of the attribute.
  - **Length**—Length of the attribute in bytes, including the Type, Length, and Value subfields.
  - **Value**—Value of the attribute. Its format and content depend on the Type subfield.

Extended RADIUS attributes



The RADIUS protocol features excellent extensibility. The Vendor-Specific attribute (attribute 26) allows a vendor to define extended attributes. The extended attributes can implement functions that the standard RADIUS protocol does not provide.

A vendor can encapsulate multiple subattributes in the TLV format in attribute 26 to provide extended functions. As shown in Figure 5, a subattribute encapsulated in attribute 26 consists of the following parts:

- **Vendor-ID**—ID of the vendor. The most significant byte is 0. The other three bytes contains a code compliant to RFC 1700.
- **Vendor-Type**—Type of the subattribute.
- **Vendor-Length**—Length of the subattribute.
- **Vendor-Data**—Contents of the subattribute.

The device supports private RADIUS subattributes with a vendor ID of 25506. For more information, see "Appendix C RADIUS subattributes (vendor ID 25506)."

Figure 5 Format of attribute 26

HWTACACS

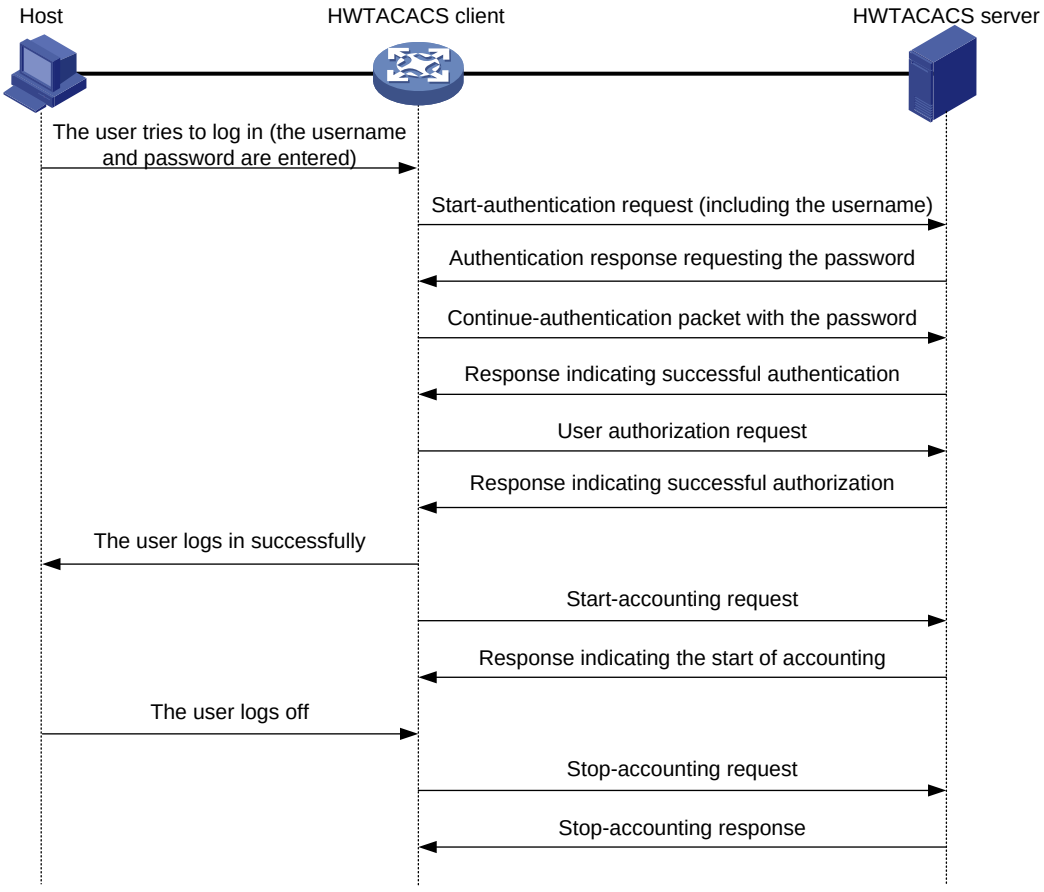
HW Terminal Access Controller Access Control System (HWTACACS) is an enhanced security protocol based on TACACS (RFC 1492). HWTACACS is similar to RADIUS, and uses a client/server model for information exchange between the NAS and the HWTACACS server.

HWTACACS typically provides AAA services for PPP, VPDN, and terminal users. In a typical HWTACACS scenario, terminal users need to log in to the NAS. Working as the HWTACACS client, the NAS sends users' usernames and passwords to the HWTACACS server for authentication. After passing authentication and obtaining authorized rights, a user logs in to the device and performs operations. The HWTACACS server records the operations that each user performs.

Differences between HWTACACS and RADIUS

HWTACACS and RADIUS have many features in common, such as using a client/server model, using shared keys for data encryption, and providing flexibility and scalability. Table 2 lists the primary differences between HWTACACS and RADIUS.

Table 2 Primary differences between HWTACACS and RADIUS



HWTACACS	RADIUS
Uses TCP, which provides reliable network	Uses UDP, which provides high transport efficiency.

HWTACACS	RADIUS
transmission.	
Encrypts the entire packet except for the HWTACACS header.	Encrypts only the user password field in an authentication packet.
Protocol packets are complicated and authorization is independent of authentication. Authentication and authorization can be deployed on different HWTACACS servers.	Protocol packets are simple and the authorization process is combined with the authentication process.
Supports authorization of configuration commands. Access to commands depends on both the user's roles and authorization. A user can use only commands that are permitted by the user roles and authorized by the HWTACACS server.	Does not support authorization of configuration commands. Access to commands solely depends on the user's roles. For more information about user roles, see *Fundamentals Configuration Guide*.

Basic HWTACACS packet exchange process

Figure 6 describes how HWTACACS performs user authentication, authorization, and accounting for a Telnet user.

Figure 6 Basic HWTACACS packet exchange process for a Telnet user

HWTACACS operates using in the following workflow:

1. A Telnet user requests to Telnet to the device and provides the username and password as instructed by the system.
2. The HWTACACS client sends a start-authentication request that includes the username to the HWTACACS server when it receives the Telnet request.

3. The HWTACACS server sends back an authentication response to request the login password.
4. Upon receipt of the response, the HWTACACS client sends the HWTACACS server a continue-authentication packet that includes the login password.
5. If the authentication succeeds, the HWTACACS server sends back an authentication response to indicate that the user has passed authentication.
6. The HWTACACS client sends a user authorization request packet to the HWTACACS server.
7. If the authorization succeeds, the HWTACACS server sends back an authorization response, indicating that the user is now authorized.
8. Knowing that the user is now authorized, the HWTACACS client pushes its CLI to the user and permits the user to log in.
9. The HWTACACS client sends a start-accounting request to the HWTACACS server.
10. The HWTACACS server sends back an accounting response, indicating that it has received the start-accounting request.
11. The user logs off.
12. The HWTACACS client sends a stop-accounting request to the HWTACACS server.
13. The HWTACACS server sends back a stop-accounting response, indicating that the stop-accounting request has been received.

LDAP

The Lightweight Directory Access Protocol (LDAP) provides standard multiplatform directory service. LDAP was developed on the basis of the X.500 protocol. It improves the following functions of X.500:

- Read/write interactive access.
- Browse.
- Search.

LDAP is suitable for storing data that does not often change. The protocol is used to store user information. For example, LDAP server software Active Directory Server is used in Microsoft Windows operating systems. The software stores the user information and user group information for user login authentication and authorization.

LDAP directory service

LDAP uses directories to maintain the organization information, personnel information, and resource information. The directories are organized in a tree structure and include entries. An entry is a set of attributes with distinguished names (DNs). The attributes are used to store information such as usernames, passwords, emails, computer names, and phone numbers.

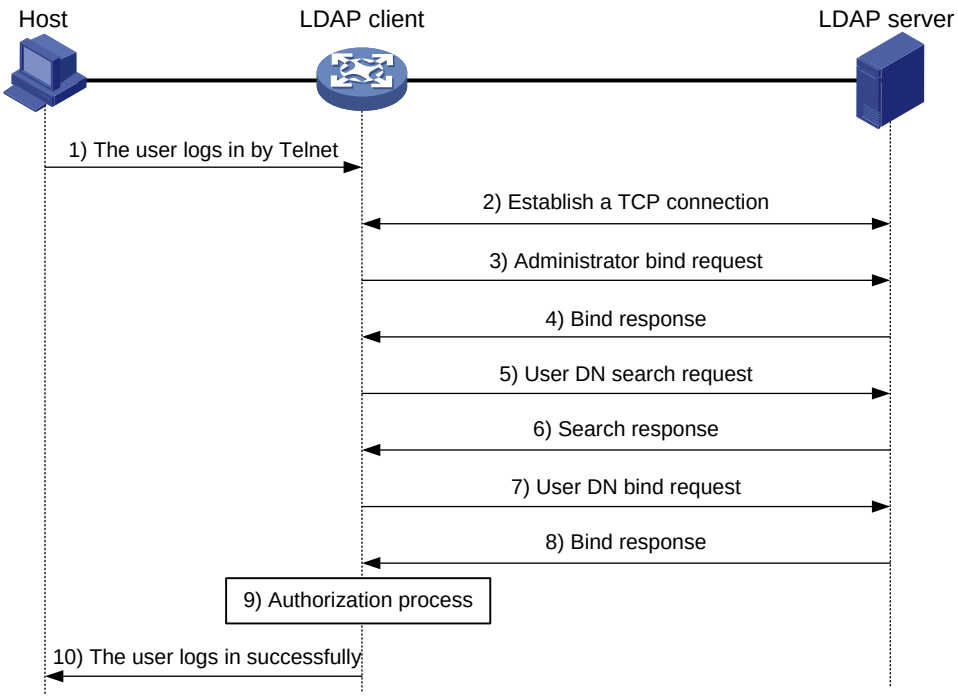
LDAP uses a client/server model, and all directory information is stored in the LDAP server. Commonly used LDAP server products include Microsoft Active Directory Server, IBM Tivoli Directory Server, and Sun ONE Directory Server.

LDAP authentication and authorization

AAA can use LDAP to provide authentication and authorization services for users. LDAP defines a set of operations to implement its functions. The main operations for authentication and authorization are the bind operation and search operation.

- The bind operation allows an LDAP client to perform the following operations:
  - Establish a connection with the LDAP server.
  - Obtain the access rights to the LDAP server.
  - Check the validity of user information.
- The search operation constructs search conditions and obtains the directory resource information of the LDAP server.

In LDAP authentication, the client completes the following tasks:



1. Uses the LDAP server administrator DN to bind with the LDAP server. After the binding is created, the client establishes a connection to the server and obtains the right to search.
2. Constructs search conditions by using the username in the authentication information of a user. The specified root directory of the server is searched and a user DN list is generated.
3. Binds with the LDAP server by using each user DN and password. If a binding is created, the user is considered legal.

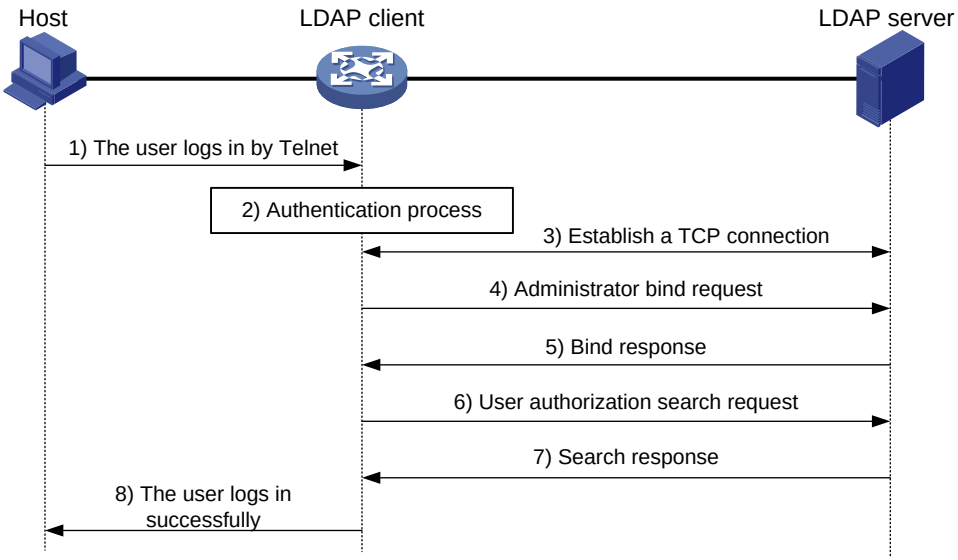
In LDAP authorization, the client performs the same tasks as in LDAP authentication. When the client constructs search conditions, it obtains both authorization information and the user DN list.

Basic LDAP authentication process

The following example illustrates the basic LDAP authentication process for a Telnet user.

Figure 7 Basic LDAP authentication process for a Telnet user

The following shows the basic LDAP authentication process:



1. A Telnet user initiates a connection request and sends the username and password to the LDAP client.
2. After receiving the request, the LDAP client establishes a TCP connection with the LDAP server.
3. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
4. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.
5. The LDAP client sends a user DN search request with the username of the Telnet user to the LDAP server.
6. After receiving the request, the LDAP server searches for the user DN by the base DN, search scope, and filtering conditions. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search. There might be one or more user DNs found.
7. The LDAP client uses the obtained user DN and the entered user password as parameters to send a user DN bind request to the LDAP server. The server will check whether the user password is correct.

8. The LDAP server processes the request, and sends a response to notify the LDAP client of the bind operation result. If the bind operation fails, the LDAP client uses another obtained user DN as the parameter to send a user DN bind request to the LDAP server. This process continues until a DN is bound successfully or all DNs fail to be bound. If all user DNs fail to be bound, the LDAP client notifies the user of the login failure and denies the user's access request.
9. The LDAP client saves the user DN that has been bound and exchanges authorization packets with the authorization server.
   - If LDAP authorization is used, see the authorization process shown in Figure 8.
   - If another method is expected for authorization, the authorization process of that method applies.
10. After successful authorization, the LDAP client notifies the user of the successful login.

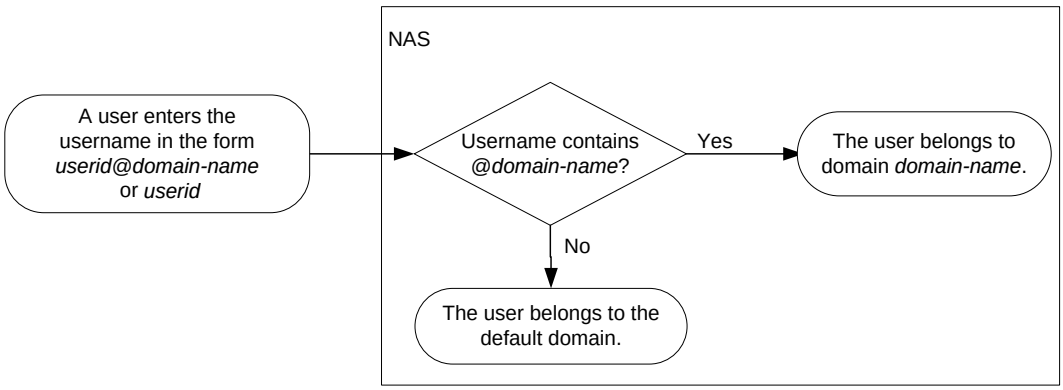
Basic LDAP authorization process

The following example illustrates the basic LDAP authorization process for a Telnet user.

Figure 8 Basic LDAP authorization process for a Telnet user

The following shows the basic LDAP authorization process:

1. A Telnet user initiates a connection request and sends the username and password to the device. The device will act as the LDAP client during authorization.
2. After receiving the request, the device exchanges authentication packets with the authentication server for the user:
   - If LDAP authentication is used, see the authentication process shown in Figure 7.
     - If the device (the LDAP client) uses the same LDAP server for authentication and authorization, skip to step 6.
     - If the device (the LDAP client) uses different LDAP servers for authentication and authorization, skip to step 4.
   - If another authentication method is used, the authentication process of that method applies. The device acts as the LDAP client. Skip to step 3.
3. The LDAP client establishes a TCP connection with the LDAP authorization server.
4. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
5. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.



6. The LDAP client sends an authorization search request with the username of the Telnet user to the LDAP server. If the user uses the same LDAP server for authentication and authorization, the client sends the request with the saved user DN of the Telnet user to the LDAP server.
7. After receiving the request, the LDAP server searches for the user information by the base DN, search scope, filtering conditions, and LDAP attributes. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search.
8. After successful authorization, the LDAP client notifies the user of the successful login.

User management based on ISP domains and user access types

AAA manages users based on the users' ISP domains and access types.

On a NAS, each user belongs to one ISP domain. The NAS determines the ISP domain to which a user belongs based on the username entered by the user at login.

Figure 9 Determining the ISP domain for a user by username

AAA manages users in the same ISP domain based on the users' access types. The device supports the following user access types:

- **LAN**—LAN users must pass 802.1X or MAC authentication to come online.
- **Login**—Login users include SSH, Telnet, FTP, and terminal users that log in to the device. Terminal users can access through a console port.
- **Portal**—Portal users must pass portal authentication to access the network.
- **HTTP/HTTPS**—Users log in to the device through HTTP or HTTPS.

The device also provides authentication modules (such as 802.1X) for implementation of user authentication management policies. If you configure these authentication modules, the ISP domains for users of the access types depend on the configuration of the authentication modules.

The device provides the following types of ISP domains for you to control access of wired 802.1, Web authentication, and MAC authentication users to network resources at different phases of authentication:

- **Preauthentication domain**—The domain to which users belong before authentication starts for them. For example, users are placed in the preauthentication domain in the following situations:
  - Before they authenticate to the network for the first time.
  - When they fail authentication in an ISP domain that does not have an auth-fail domain.
  - When no authentication servers are available, they are assigned to the specified critical domain. However, the specified critical domain does not exist.

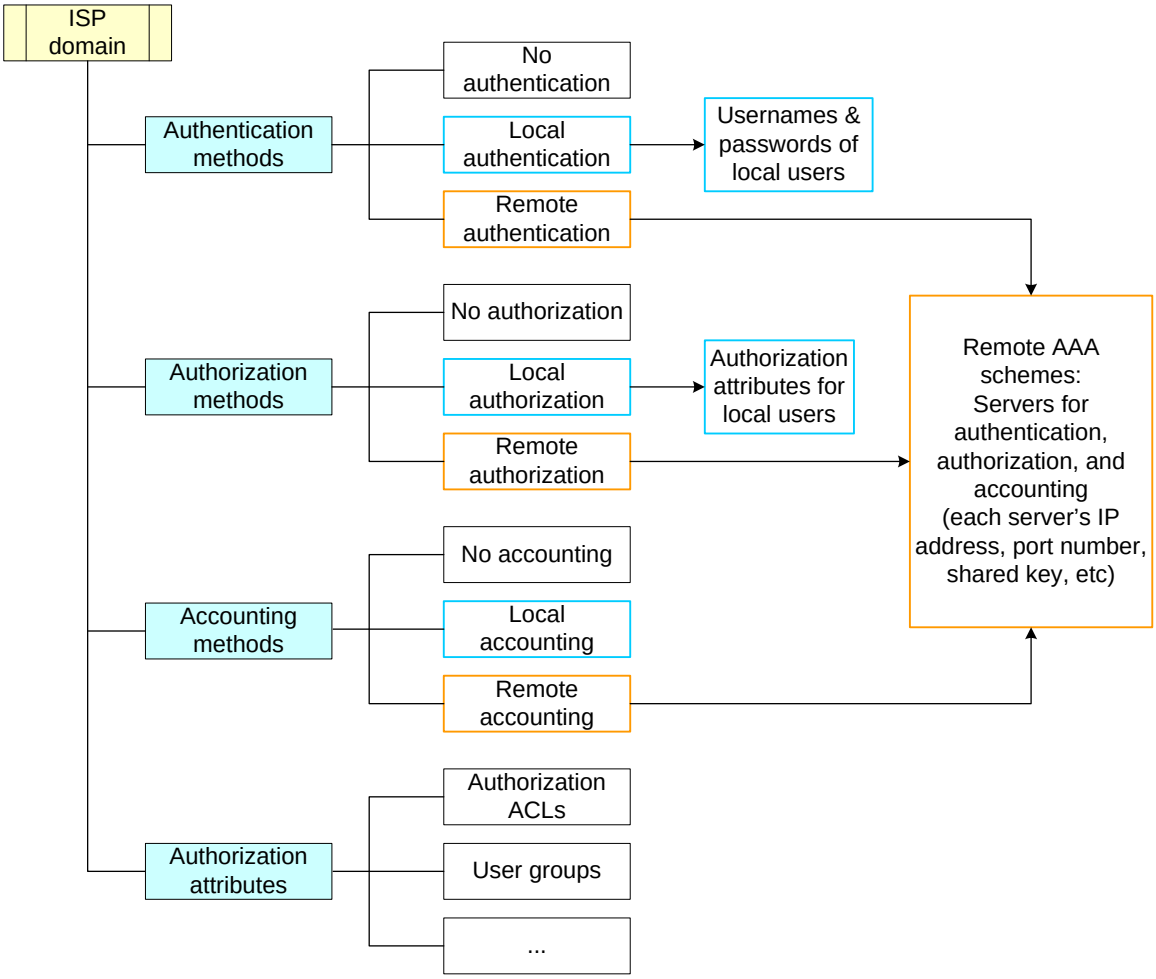
  The preauthentication domain is applicable only to 802.1X and Web authentication users.

- **Authentication domain**—The ISP domain in which users are authenticated and come online.
- **Auth-fail domain**—The ISP domain specified to accommodate users that have failed authentication in an authentication domain.
- **Critical domain**—The ISP domain specified to accommodate users that access an authentication domain when all RADIUS servers in that authentication domain are unavailable.
- **Recovery domain**—The ISP domain to which users in the critical domain are moved after a RADIUS authentication server in their authentication domain becomes available.

IMPORTANT:

In the current version, you must specify the authentication domain as the recovery domain.

Figure 10 Movement of users between different types of ISP domains



Authentication, authorization, and accounting methods

As shown in Figure 11, an ISP domain represents a set of authentication, authorization, and accounting methods for different types of users in an ISP domain. The NAS determines the ISP domain and access type of a user. The NAS also uses the methods configured for the access type in the domain to control the user's access.

AAA also supports configuring a set of default methods for an ISP domain. These default methods are applied to users for whom no AAA methods are configured.

Figure 11 AAA configuration structure for an ISP domain

Authentication methods

The device supports the following authentication methods:

- **No authentication**—This method trusts all users and does not perform authentication. For security purposes, do not use this method.
- **Local authentication**—The NAS authenticates users by itself, based on the locally configured user information including the usernames, passwords, and attributes. Local authentication allows high speed and low cost, but the amount of information that can be stored is limited by the size of the storage space.
- **Remote authentication**—The NAS works with a remote server to authenticate users. The NAS communicates with the remote server through the RADIUS, HWTACACS, or LDAP protocol. The server manages user information in a centralized manner. Remote authentication provides high capacity, reliable, and centralized authentication services for multiple NASs. You can configure backup methods to be used when the remote server is not available.

Authorization methods

The device supports the following authorization methods:

- **No authorization**—The NAS performs no authorization exchange. The following default authorization information applies after users pass authentication:
  - Login users obtain the level-0 user role. For more information about the level-0 user role, see RBAC configuration in *Fundamentals Configuration Guide*.

    - The working directory for FTP, SFTP, and SCP login users is the root directory of the NAS. However, the users do not have permission to access the root directory.
    - Non-login users can access the network.
- **Local authorization**—The NAS performs authorization according to the user attributes locally configured for users.
- **Remote authorization**—The NAS works with a remote server to authorize users. RADIUS authorization is bound with RADIUS authentication. RADIUS authorization can work only after RADIUS authentication is successful, and the authorization information is included in the Access-Accept packet. HWTACACS or LDAP authorization is separate from authentication, and the authorization information is included in the authorization response after successful authentication. You can configure backup methods to be used when the remote server is not available.

Accounting methods

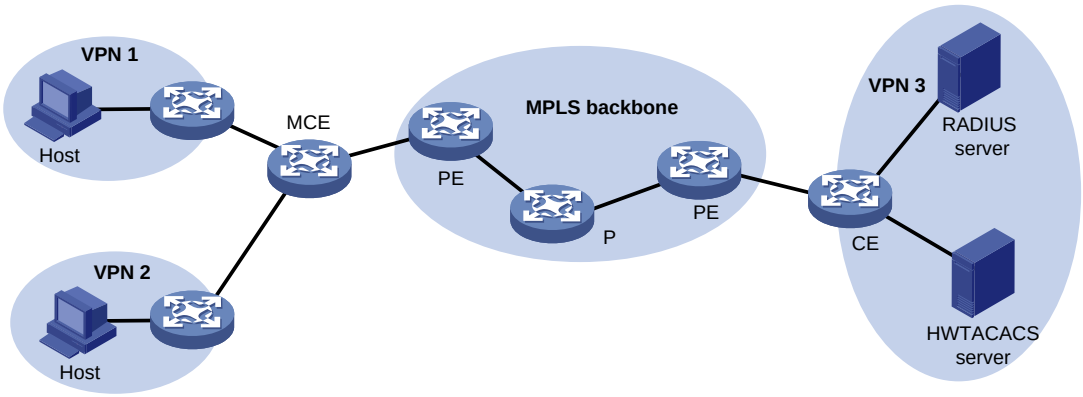
The device supports the following accounting methods:

- **No accounting**—The NAS does not perform accounting for the users.
- **Local accounting**—Local accounting is implemented on the NAS. It counts and controls the number of concurrent users that use the same local user account, but does not provide statistics for charging.
- **Remote accounting**—The NAS works with a RADIUS server or HWTACACS server for accounting. You can configure backup methods to be used when the remote server is not available.

Authorization attribute configuration methods

You can configure authorization attributes for an ISP domain on the NAS, on a server, or on both the NAS and a server. Server-assigned authorization attributes have higher priority than NAS-assigned settings. NAS-assigned attributes can take effect only if they do not conflict with server-assigned attributes. If a NAS-assigned attribute conflicts with a server-assigned attribute, the server-assigned attribute takes effect.

AAA extended functions



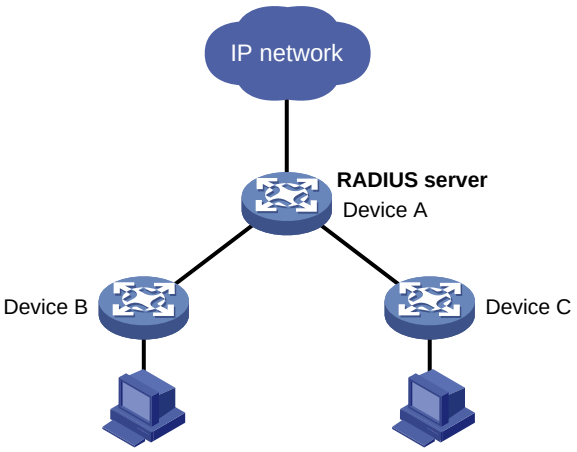
The device provides the following login services to enhance device security:

- **Command authorization**—Enables the NAS to let the authorization server determine whether a command entered by a login user is permitted. Login users can execute only commands permitted by the authorization server. For more information about command authorization, see *Fundamentals Configuration Guide*.
- **Command accounting**—When command authorization is disabled, command accounting enables the accounting server to record all valid commands executed on the device. When command authorization is enabled, command accounting enables the accounting server to record all authorized commands. For more information about command accounting, see *Fundamentals Configuration Guide*.
- **User role authentication**—Authenticates each user that wants to obtain another user role without logging out or getting disconnected. For more information about user role authentication, see *Fundamentals Configuration Guide*.

AAA for VPNs

You can deploy AAA across VPNs to enable forwarding of authentication, authorization, and accounting packets across VPNs. For example, as shown in Figure 12, The MCE at the left side of the MPLS backbone acts as a NAS. The NAS transparently delivers the AAA packets of private users in VPN 1 and VPN 2 to the AAA servers in VPN 3 for centralized authentication. Authentication packets of private users in different VPNs do not affect each other.

Figure 12 Network diagram



This feature can also help an MCE to implement portal authentication for VPNs. For more information about MCE, see *MCE Configuration Guide*. For more information about portal authentication, see "Configuring portal authentication."

RADIUS server feature of the device

Enable the RADIUS server feature of the device to work with RADIUS clients for user authentication and authorization. The device can act as a dedicated RADIUS server or as both a RADIUS server and a RADIUS client at the same time.

The RADIUS server feature provides for flexible networks with less cost. As shown in Figure 13, Device A provides RADIUS server functions at the distribution layer; Device B and Device C are configured with RADIUS schemes to implement user authentication and authorization at the access layer.

Figure 13 Network diagram

The RADIUS server feature supports the following operations:

- Manages RADIUS user data, which is generated from local user information and includes user name, password, description, authorization ACL, authorization VLAN, and expiration time.
- Manages RADIUS clients. You can add, modify, and delete RADIUS clients. A RADIUS client is identified by the IP address, and it includes attribute information such as the shared key. The RADIUS server feature processes authentication requests only from the managed RADIUS clients and ignores requests from unknown clients.
- Authenticates and authorizes users of the network access type. The server does not provide accounting.

When the RADIUS server receives a RADIUS packet, it performs the following actions:

1. Verifies that the packet is sent from a managed RADIUS client.
2. Verifies the packet with the shared key.
3. Verifies that the user account exists, the password is correct, and other attributes meet the requirements (for example, the account is in the validity period).
4. Determines the authentication result and authorizes specific privileges to the authenticated user.

The RADIUS server feature of the device has the following restrictions:

- The authentication port is fixed at UDP 1812 and cannot be modified.
- The feature is supported on IPv4 networks, but not on IPv6 networks.
- The server provides only PAP and CHAP authentication methods.
- User names sent to the RADIUS server cannot include a domain name.

Protocols and standards

- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 2866, *RADIUS Accounting*
- RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 3576, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 1777, *Lightweight Directory Access Protocol*
- RFC 2251, *Lightweight Directory Access Protocol (v3)*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

AAA tasks at a glance

To configure AAA, perform the following tasks:

1. Configuring AAA schemes

   If local authentication is used, configure local users and the related attributes. If remote authentication is used, configure the required RADIUS, HWTACACS, or LDAP schemes.

   - Configuring local users
   - Configuring RADIUS
   - Configuring HWTACACS
   - Configuring LDAP

2. Configuring an ISP domain
   a. Creating an ISP domain
   b. Configuring ISP domain attributes
3. Configuring AAA methods for an ISP domain

   Configure authentication, authorization, and accounting methods for an ISP domain as needed. These methods use existing AAA schemes.
   - Configuring authentication methods for an ISP domain
   - Configuring authorization methods for an ISP domain
   - Configuring accounting methods for an ISP domain
4. (Optional.) Configuring advanced AAA features
   - Configuring AAA fail-permit and recovery
   - Setting the maximum number of concurrent login users
   - Configuring a NAS-ID
   - Configuring the device ID
   - Enabling password change prompt logging
   - Configuring the RADIUS server feature
   - Configuring user online and offline recording
   - Configuring the connection recording policy
   - Configuring the AAA test feature

Configuring local users

About local users

To implement local authentication, authorization, and accounting, create local users and configure user attributes on the device. The local users and attributes are stored in the local user database on the device. A local user is uniquely identified by the combination of a username and a user type.

Local users are classified into the following types:

- **Device management user**—User that logs in to the device for device management.
- **Network access user**—User that accesses network resources through the device.

  Network access users also include guests that access the network temporarily. Guests can use only LAN and portal services.

The following shows the configurable local user attributes:

- **Description**—Descriptive information of the user.
- **Service type**—Services that the user can use. Local authentication checks the service types of a local user. If none of the service types is available, the user cannot pass authentication.
- **User state**—Whether or not a local user can request network services. There are two user states: active and blocked. A user in active state can request network services, but a user in blocked state cannot.
- **Upper limit of concurrent logins using the same user name**—Maximum number of users that can concurrently access the device by using the same user name. When the number reaches the upper limit, no more local users can access the device by using the user name.
- **User group**—Each local user belongs to a local user group and has all attributes of the group. The attributes include the password control attributes and authorization attributes. For more information about local user group, see "Configuring user group attributes."

- **Binding attributes**—Binding attributes control the scope of users, and are checked during local authentication of a user. If the attributes of a user do not match the binding attributes configured for the local user account, the user cannot pass authentication.
- **Authorization attributes**—Authorization attributes indicate the user's rights after it passes local authentication.

  Configure the authorization attributes based on the service type of local users.

  You can configure an authorization attribute in user group view or local user view. The setting of an authorization attribute in local user view takes precedence over the attribute setting in user group view.

  The attribute configured in user group view takes effect on all local users in the user group.

  The attribute configured in local user view takes effect only on the local user.
- **Password control attributes**—Password control attributes help control password security for local users. Password control attributes include password aging time, minimum password length, password composition checking, password complexity checking, and login attempt limit.

  You can configure a password control attribute in system view, user group view, or local user view. A password control attribute with a smaller effective range has a higher priority. For more information about password management and global password configuration, see "Configuring password control."
- **Validity period**—Time period in which a network access user is considered valid for authentication.

Local user configuration tasks at a glance

To configure local users, perform the following tasks:

1. Configuring local user attributes
   - Configuring attributes for device management users
   - Configuring attributes for network access users
   - Configuring local guest attributes
2. (Optional.) Configuring user group attributes
3. (Optional.) Managing local guests
4. (Optional.) Configuring the local user auto-delete feature
5. (Optional.) Configuring SNMP notifications for local users

Configuring attributes for device management users

Restrictions and guidelines

When you configure the interface binding attribute for a device management user, follow these restrictions and guidelines to avoid authentication failure:

- Specify the actual access interface of the user as the binding interface for the user.
- Make sure the user's authentication packets include the user's access interface.

If password control is globally enabled for device management users by using the **`password-control enable`** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for device management users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **`display current-configuration`** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Procedure

1. Enter system view.

   system-view

2. Add a device management user and enter device management user view.

   local-user *user-name* **class manage**

3. Configure a password for the device management user.

   In non-FIPS mode:

   password [{ **hash** | **simple** } *string*]

   A non-password-protected user passes authentication if the user provides the correct username and passes attribute checks. To enhance security, configure a password for each device management user.

   In FIPS mode:

   password

   Only password-protected users can pass authentication. You must set the password in interactive mode for a device management user.

4. Assign services to the device management user.

   In non-FIPS mode:

   service-type { **ftp** | { **http** | **https** | **ssh** | **telnet** | **terminal** } * }

   In FIPS mode:

   service-type { **https** | **ssh** | **terminal** } *

   By default, no services are authorized to a device management user.

5. (Optional.) Set the status of the device management user.

   state { **active** | **block** }

   By default, a device management user is in active state and can request network services.

6. (Optional.) Set the upper limit of concurrent logins using the device management username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a device management user.

   This command takes effect only when local accounting is configured for device management users. This command does not apply to FTP, SFTP, or SCP users that do not support accounting.

7. (Optional.) Configure the interface binding attribute for the device management user.

   bind-attribute location interface *interface-type interface-number*

   By default, no interface binding attribute is configured for a device management user.

8. (Optional.) Configure authorization attributes for the device management user.

   authorization-attribute { **idle-cut** *minutes* | **user-role** *role-name* | **work-directory** *directory-name* } *

   The following default settings apply:

   - The working directory for FTP, SFTP, and SCP users is the root directory of the NAS. However, the users do not have permission to access the root directory.
   - The network-operator user role is assigned to the device management local users that are created by a network-admin, system-admin, or level-15 user.

9. (Optional.) Configure password control attributes for the device management user. Choose the following tasks as needed:

   - Set the password aging time.

     password-control aging *aging-time*

   - Set the minimum password length.

password-control length *length*

- Configure the password composition policy.

  password-control composition type-number *type-number* [**type-length** *type-length*]

- Configure the password complexity checking policy.

  password-control complexity { **same-character** | **user-name** } **check**

- Configure the maximum login attempts and the action to take if there is a login failure.

  password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

By default, a device management user uses password control attributes of the user group to which the user belongs.

10. (Optional.) Assign the device management user to a user group.

group *group-name*

By default, a device management user belongs to user group **system**.

Configuring attributes for network access users

Restrictions and guidelines

If password control is globally enabled for network access users by using the **password-control enable network-class** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for network access users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Configure the **location** binding attribute based on the service types of users.

- For 802.1X users, specify the 802.1X-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For MAC authentication users, specify the MAC authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For Web authentication users, specify the Web authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For portal users, specify the portal-enabled interfaces through which the users access the device. Specify the Layer 2 Ethernet interfaces if portal is enabled on VLAN interfaces and the **portal roaming enable** command is not used.

Procedure

1. Enter system view.

system-view

2. Add a network access user and enter network access user view.

local-user *user-name* **class network**

3. (Optional.) Configure a password for the network access user.

password { **cipher** | **simple** } *string*

4. (Optional.) Configure a description for the network access user.

description *text*

By default, no description is configured for a local user.

5. Assign services to the network access user.

service-type { **lan-access** | **portal** }

By default, no services are authorized to a network access user.

6. (Optional.) Set the status of the network access user.

   state { **active** | **block** }

   By default, a network access user is in active state and can request network services.

7. (Optional.) Set the upper limit of concurrent logins using the network access username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a network access user.

8. (Optional.) Configure binding attributes for the network access user.

   bind-attribute { **ip** *ip-address* | **location interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

   By default, no binding attributes are configured for a network access user.

9. (Optional.) Configure authorization attributes for the network access user.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* [**termination-action-request**] | **url** *url-string* | **vlan** *vlan-id* } *

   By default, a network access user does not have authorization attributes.

10. (Optional.) Configure password control attributes for the network access user. Choose the following tasks as needed:

    - Set the minimum password length.

      password-control length *length*

    - Configure the password composition policy.

      password-control composition type-number *type-number* [**type-length** *type-length*]

    - Configure the password complexity checking policy.

      password-control complexity { **same-character** | **user-name** } **check**

    By default, a network access user uses password control attributes of the user group to which the user belongs.

11. (Optional.) Assign the network access user to a user group.

    group *group-name*

    By default, a network access user belongs to user group **system**.

12. (Optional.) specify the validity period for the local user.

    validity-datetime { **from** *start-date start-time* **to** *expiration-date expiration-time* | **from** *start-date start-time* | **to** *expiration-date expiration-time* }

    By default, the validity period for a network access user does not expire.

Configuring local guest attributes

About this task

Create local guests and configure guest attributes to control temporary network access behavior. Guests can access the network after passing local authentication. You can configure the recipient addresses and email attribute information to the local guests and guest sponsors.

Procedure

1. Enter system view.

   system-view

2. Create a local guest and enter local guest view.
   local-user *user-name* **class network guest**
3. (Optional.) Configure a password for the local guest.
   password { **cipher** | **simple** } *string*
4. Configure basic information for the local guest. Choose the following tasks as needed:
   - Configure a description for the local guest.
     description *text*
     By default, no description is configured for a local guest.
   - Specify the name of the local guest.
     full-name *name-string*
     By default, no name is specified for a local guest.
   - Specify the company of the local guest.
     company *company-name*
     By default, no company is specified for a local guest.
   - Specify the phone number of the local guest.
     phone *phone-number*
     By default, no phone number is specified for a local guest.
   - Specify the email address of the local guest.
     email *email-string*
     By default, no email address is specified for a local guest.
   - Specify the sponsor name for the local guest.
     sponsor-full-name *name-string*
     By default, no sponsor name is specified for a local guest.
   - Specify the sponsor department for the local guest.
     sponsor-department *department-string*
     By default, no sponsor department is specified for a local guest.
   - Specify the sponsor email address for the local guest.
     sponsor-email *email-string*
     By default, no sponsor email address is specified for a local guest.
5. (Optional.) Configure the validity period for the local guest.
   validity-datetime from *start-date start-time* **to** *expiration-date expiration-time*
   By default, a local guest does not expire.
6. (Optional.) Assign the local guest to a user group.
   group *group-name*
   By default, a local guest belongs to the system-defined user group **system**.
7. (Optional.) Configure the local guest status.
   state { **active** | **block** }
   By default, a local guest is in active state and is allowed to request network services.

Configuring user group attributes

About this task

User groups simplify local user configuration and management. A user group contains a group of local users and has a set of local user attributes. You can configure local user attributes for a user group to implement centralized user attributes management for the local users in the group. Local user attributes that are manageable include authorization attributes.

Procedure

1. Enter system view.

   system-view

2. Create a user group and enter user group view.

   user-group *group-name*

   By default, a system-defined user group exists. The group name is **system**.

3. Configure authorization attributes for the user group.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **url** *url-string* | **vlan** *vlan-id* | **work-directory** *directory-name* } *

   By default, no authorization attributes are configured for a user group.

4. (Optional.) Configure password control attributes for the user group. Choose the following tasks as needed:

   - Set the password aging time.

     password-control aging *aging-time*

   - Set the minimum password length.

     password-control length *length*

   - Configure the password composition policy.

     password-control composition type-number *type-number* [**type-length** *type-length*]

   - Configure the password complexity checking policy.

     password-control complexity { **same-character** | **user-name** } **check**

   - Configure the maximum login attempts and the action to take for login failures.

     password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, a user group uses the global password control settings. For more information, see "Configuring password control."

Managing local guests

About this task

The local guest management features are for registration, approval, maintenance, and access control of local guests.

The device provides the following local guest management features:

- **Registration and approval**—The device creates local guests after the guest registration information is approved by a guest manager.

  The registration and approval processes are as follows:

  a. The device pushes the portal user registration page to a user that wants to access the network as a local guest.

b. The user submits account information for registration, including the user name, password, and email address.

c. The device forwards the registration request to the guest manager in an email notification.

d. The guest manager adds supplementary information as needed and approves the registration information.

The guest manager must process the registration request before the waiting-approval timeout timer expires. The device automatically deletes expired registration request information.

e. The device creates a local guest account and sends an email notification to the user and guest sponsor. The email contains local guest account, password, validity period, and other account information.

The user can access the network as a local guest.

- **Email notification**—The device notifies the local guests, guest sponsors, or guest managers by email of the guest account information or guest registration requests.
- **Local guest creation in batch**—Create a batch of local guests.
- **Local guest import**—Import guest account information from a .csv file to create local guests on the device based on the imported information.
- **Local guest export**—Export local guest account information to a .csv file. You can import the account information to other devices as needed.

Procedure

1. Enter system view

system-view

2. Configure the email notification feature for local guests.

a. Configure the subject and body of email notifications.

local-guest email format to { **guest** | **manager** | **sponsor** } { **body** *body-string* | **subject** *sub-string* }

By default, no subject or body is configured.

b. Configure the email sender address in the email notifications sent by the device for local guests.

local-guest email sender *email-address*

By default, no email sender address is configured for the email notifications sent by the device.

c. Specify an SMTP server for sending email notifications of local guests.

local-guest email smtp-server *url-string*

By default, no SMTP server is specified.

3. Configure the guest manager's email address.

local-guest manager-email *email-address*

By default, the guest manager's email address is not configured.

4. (Optional.) Set the waiting-approval timeout timer for guest registration requests.

local-guest timer waiting-approval *time-value*

By default, the waiting-approval timeout timer for guest registration requests is 24 hours.

5. (Optional.) Create local guests in batch.

local-guest generate username-prefix *name-prefix* [**password-prefix** *password-prefix*] **suffix** *suffix-number* [**group** *group-name*] **count** *user-count* **validity-datetime** *start-date start-time* **to** *expiration-date expiration-time*

Batch generated local guests share the same name prefix. You can also configure a password prefix to be shared by the guests.

6. (Optional.) Import guest account information from a .csv file in the specified path to create local guests based on the imported information.

   local-user-import class network guest url *url-string* **validity-datetime** *start-date start-time* **to** *expiration-date expiration-time* [**auto-create-group** | **override** | **start-line** *line-number*] *

7. (Optional.) Export local guest account information to a .csv file in the specified path.

   local-user-export class network guest url *url-string*

8. (Optional.) Send email notifications to the local guest or the guest sponsor.

   a. Return to user view.

      quit

   b. Send email notifications to the local guest or the guest sponsor. The email contents include the user name, password, and validity period of the guest account.

      local-guest send-email user-name *user-name* **to** { **guest** | **sponsor** }

Configuring the local user auto-delete feature

About this task

This feature enables the device to examine the validity of local users at fixed time periods of 10 minutes and automatically delete expired local users.

Procedure

1. Enter system view

   system-view

2. Enable the local user auto-delete feature.

   local-user auto-delete enable

   By default, the local user auto-delete feature is disabled.

Configuring SNMP notifications for local users

About this task

With SNMP notifications enabled for password changes of local users, the system generates alarms when one of the following cases occurs:

- The password of a local user is configured or changed from the CLI.
- The password of a local user is changed through NETCONF or MIB.
- The password of a portal user is changed online on the login page.

For RADIUS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view

   system-view

2. Enable SNMP notifications for password changes of local users.

   snmp-agent trap enable local-server [**manage-password-change** | **network-password-change**] *

By default, all SNMP notifications are disabled for password changes of local users.

Display and maintenance commands for local users and local user groups

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display pending registration requests for local guests.	**display local-guest waiting-approval** [**user-name** *user-name*]
Display the local user configuration and online user statistics.	**display local-user** [**class** { **manage** | **network** [**guest**] } | **idle-cut** { **disable** | **enable** } | **service-type** { **ftp** | **http** | **https** | **lan-access** | **portal** | **ssh** | **telnet** | **terminal** } | **state** { **active** | **block** } | **user-name** *user-name* **class** { **manage** | **network** [**guest**] } | **vlan** *vlan-id*]
Display user group configuration.	**display user-group** { **all** | **name** *group-name* }
Clear pending registration requests for local guests.	**reset local-guest waiting-approval** [**user-name** *user-name*]

Configuring RADIUS

RADIUS tasks at a glance

To configure RADIUS, perform the following tasks:

1. Configuring an EAP profile

   To perform EAP-based RADIUS server status detection, you must configure an EAP profile and specify the EAP profile in a test profile.
2. Configuring a test profile for RADIUS server status detection

   To detect the status of a RADIUS server, you must configure a test profile and configure the RADIUS server to use the test profile in a RADIUS scheme.
3. Creating a RADIUS scheme
4. Specifying RADIUS authentication servers
5. Specifying the RADIUS accounting servers
6. Specifying the shared keys for secure RADIUS communication

   Perform this task if no shared keys are specified when configuring RADIUS authentication or accounting servers.
7. Specifying the MPLS L3VPN instance for a RADIUS scheme

   Perform this task if no MPLS L3VPN instances are specified when configuring RADIUS authentication or accounting servers.
8. (Optional.) Setting the status of RADIUS servers
9. (Optional.) Setting RADIUS timers
10. (Optional.) Configuring parameters for RADIUS packets
    - Specifying the source IP address for outgoing RADIUS packets

- Setting the username format and traffic statistics units
- Setting the maximum number of RADIUS request transmission attempts
- Setting the maximum number of real-time accounting attempts
- Setting the DSCP priority for RADIUS packets

11. (Optional.) Configuring parameters for RADIUS attributes
    - Configuring the format of the RADIUS NAS-Port attribute
    - Configuring the Login-Service attribute check method for SSH, FTP, and terminal users
    - Interpreting the RADIUS class attribute as CAR parameters
    - Configuring the MAC address format for the RADIUS Called-Station-Id attribute
    - Configuring the MAC address format for the RADIUS Calling-Station-Id attribute
    - Configuring the format of RADIUS attribute 87
    - Setting the data measurement unit for the Remanent_Volume attribute
    - Including subattribute 218 of vendor 25506 in outgoing RADIUS packets
    - Configuring the RADIUS attribute translation feature
12. (Optional.) Configuring extended RADIUS features
    - Configuring RADIUS stop-accounting packet buffering
    - Enabling forcibly sending stop-accounting packets
    - Enabling the RADIUS server load sharing feature
    - Specifying a RADIUS server selection mode for reauthentication
    - Configuring the RADIUS accounting-on feature
    - Configuring the RADIUS session-control feature
    - Configuring the RADIUS DAS feature
    - Configuring the device to preferentially process RADIUS authentication requests
    - Enabling SNMP notifications for RADIUS
    - Disabling the RADIUS service
    - Enabling RADIUS server parallel authentication
    - Configuring authentication and accounting packets to carry attribute Message-Authenticator numbered 80
    - Configure the idle timeout for TLS connections in RADIUS authentication

Restrictions and guidelines for RADIUS configuration

If the authentication server in a RADIUS scheme is provided by the RADIUS server feature on the device, you need to configure only the following items for the RADIUS scheme:

- RADIUS authentication server.
- Shared key for RADIUS communication.
- Username format for interaction with the RADIUS server.

Configuring an EAP profile

About this task

An EAP profile is a collection of EAP authentication settings, including the EAP authentication method and the CA certificate file to be used for some EAP authentication methods.

Restrictions and guidelines

You can specify an EAP profile in multiple test profiles.

You can configure a maximum of 16 EAP profiles.

Prerequisites

Before you specify a CA certificate file, use FTP or TFTP to transfer the CA certificate file to the root directory of the default storage medium on the device.

In an IRF fabric, make sure the CA certificate file exists in the root directory of the default storage medium on the master device before you specify the file.

Procedure

1. Enter system view.
   system-view
2. Create an EAP profile and enter EAP profile view.
   eap-profile *eap-profile-name*
3. Specify the EAP authentication method.
   method { **md5** | **peap-gtc** | **peap-mschapv2** | **tls** | **ttls-gtc** | **ttls-mschapv2** }
   By default, the EAP authentication method is MD5-challenge.
4. Specify a CA certificate file for EAP authentication.
   ca-file *file-name*
   By default, no CA certificate file is specified for EAP authentication.
   You must specify a CA certificate file to verify the RADIUS server certificate if the EAP authentication method is PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, or TTLS-MSCHAPv2.

Configuring a test profile for RADIUS server status detection

About this task

To detect the reachability or availability of a RADIUS authentication server, specify a test profile for the RADIUS server when you specify the server in a RADIUS scheme. With the test profile, the device refreshes the RADIUS server status at each detection interval according to the detection result. If the server is unreachable or unavailable, the device sets the status of the server to blocked. If the server is reachable or available, the device sets the status of the server to active.

The device supports the following RADIUS server status detection methods:

- **Simple detection**—For a RADIUS server, the device simulates an authentication request with the username and password specified in the test profile used by the server. The authentication request is sent to the RADIUS server within each detection interval. The device determines that the RADIUS server is reachable if the device receives a response from the server within the interval.
- **EAP-based detection**—For a RADIUS server, the device simulates an EAP authentication with the username and password specified in the test profile used by the server. The simulated EAP authentication starts at the beginning of each detection interval. If the EAP authentication completes within a detection interval, the device determines that the RADIUS server is available.

Simulating a complete EAP authentication process, EAP-based detection provides more reliable detection results than simple detection. As a best practice, configure EAP-based detection on a network environment where EAP authentication is configured.

Restrictions and guidelines

You can configure multiple test profiles in the system.

The device starts detecting the status of a RADIUS authentication server only if an existing test profile is specified for the server.

If you specify a nonexistent EAP profile in a test profile, the device performs simple detection for the RADIUS servers that use the test profile. After the EAP profile is configured, the device will start EAP-based detection at the next detection interval.

The device stops detecting the status of a RADIUS server when one of the following operations is performed:

- The RADIUS server is removed from the RADIUS scheme.
- The test profile configuration for the RADIUS server is removed in RADIUS scheme view.
- The test profile specified for the RADIUS server is deleted.
- The RADIUS server is manually set to the blocked state.
- The RADIUS scheme that contains the RADIUS server is deleted.

Procedure

1. Enter system view.

   system-view

2. Configure a test profile for detecting the status of RADIUS authentication servers.

   radius-server test-profile *profile-name* **username** *name* [**password** { **cipher** | **simple** } *string*] [**interval** *interval*] [**confirm** | **eap-profile** *eap-profile-name*]

Creating a RADIUS scheme

Restrictions and guidelines

You can configure a maximum of 16 RADIUS schemes. A RADIUS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view

2. Create a RADIUS scheme and enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

Specifying RADIUS authentication servers

About this task

A RADIUS authentication server completes authentication and authorization together, because authorization information is piggybacked in authentication responses sent to RADIUS clients.

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unreachable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an authentication request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS authentication server can function as the primary authentication server for one scheme and a secondary authentication server for another scheme at the same time.

Two authentication servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS authentication server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS authentication servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the RADIUS accounting servers

About this task

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unavailable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an accounting request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS accounting server can function as the primary accounting server for one scheme and a secondary accounting server for another scheme at the same time.

Two accounting servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

RADIUS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

radius scheme *radius-scheme-name*

3. Specify the primary RADIUS accounting server.
primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS accounting server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS accounting server.
secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS accounting servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the shared keys for secure RADIUS communication

About this task

The RADIUS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

A key configured in this task is for all servers of the same type (accounting or authentication) in the scheme. The key has a lower priority than a key configured individually for a RADIUS server.

Restrictions and guidelines

The shared key configured on the device must be the same as the shared key configured on the RADIUS server.

Procedure

1. Enter system view.
system-view
2. Enter RADIUS scheme view.
radius scheme *radius-scheme-name*
3. Specify a shared key for secure RADIUS communication.
key { **accounting** | **authentication** } { **cipher** | **simple** } *string*

   By default, no shared key is specified for secure RADIUS communication.

Specifying the MPLS L3VPN instance for a RADIUS scheme

About this task

The VPN instance specified for a RADIUS scheme applies to all authentication and accounting servers in that scheme. If a VPN instance is also configured for an individual RADIUS server, the VPN instance specified for the RADIUS scheme does not take effect on that server.

Procedure

1. Enter system view.
system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a VPN instance for the RADIUS scheme.

   vpn-instance *vpn-instance-name*

   By default, a RADIUS scheme belongs to the public network.

Setting the status of RADIUS servers

About this task

To control the RADIUS servers with which the device communicates when the current servers are no longer available, set the status of RADIUS servers to blocked or active. You can specify one primary RADIUS server and multiple secondary RADIUS servers. The secondary servers function as the backup of the primary server. When the RADIUS server load sharing feature is disabled, the device chooses servers based on the following rules:

- When the primary server is in active state, the device first tries to communicate with the primary server. If the primary server is unreachable, the device searches for an active secondary server in the order the servers are configured.
- When one or more servers are in active state, the device tries to communicate with these active servers only, even if the servers are unavailable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If a server is unreachable, the device performs the following operations:
  - Changes the server status to blocked.
  - Starts a quiet timer for the server.
  - Tries to communicate with the next secondary server in active state that has the highest priority.
- When the quiet timer of a server expires or you manually set the server to the active state, the status of the server changes back to active. The device does not check the server again during the authentication or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is reachable, the device considers the authentication or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When a RADIUS server's status changes automatically, the device changes this server's status accordingly in all RADIUS schemes in which this server is specified.
- When a RADIUS server is manually set to blocked, server detection is disabled for the server, regardless of whether a test profile has been specified for the server. When the RADIUS server is set to active state, server detection is enabled for the server on which an existing test profile is specified.

By default, the device sets the status of all RADIUS servers to active. However, in some situations, you must change the status of a server. For example, if a server fails, you can change the status of the server to blocked to avoid communication attempts to the server.

Restrictions and guidelines

The configured server status cannot be saved to any configuration file, and can only be viewed by using the **display radius scheme** command.

After the device restarts, all servers are restored to the active state.

The device selects a reachable server for the authentication or accounting of a new user according to the server selection rules in this section if the RADIUS server load sharing feature is disabled. However, these rules are inapplicable to the reauthentication of online users if the RADIUS server selection mode for reauthentication is set to inherit by using the **reauthentication server-select inherit** command.

Procedure

1. Enter system view.

   system-view
2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*
3. Set the RADIUS server status. Choose the following tasks as needed:
   - Set the status of the primary RADIUS authentication server.

     state primary authentication { **active** | **block** }
   - Set the status of the primary RADIUS accounting server.

     state primary accounting { **active** | **block** }
   - Set the status of a secondary RADIUS authentication server.

     state secondary authentication [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }
   - Set the status of a secondary RADIUS accounting server.

     state secondary accounting [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }

   By default, a RADIUS server is in active state.

Setting RADIUS timers

About this task

The device uses the following types of timers to control communication with a RADIUS server:

- **Server response timeout timer** (**response-timeout**)—Defines the RADIUS request retransmission interval. The timer starts immediately after a RADIUS request is sent. If the device does not receive a response from the RADIUS server before the timer expires, it resends the request.
- **Server quiet timer** (**quiet**)—Defines the duration to keep an unreachable server in blocked state. If one server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.
- **Real-time accounting timer** (**realtime-accounting**)—Defines the intervals at which the device sends real-time accounting packets to the RADIUS accounting server for online users.

Restrictions and guidelines

Consider the number of secondary servers when you configure the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer. If the RADIUS scheme includes many secondary servers, the retransmission process might be too long and the client connection in the access module, such as Telnet, can time out.

When the client connections have a short timeout period, a large number of secondary servers can cause the initial authentication or accounting attempt to fail. In this case, reconnect the client rather than adjusting the RADIUS packet transmission attempts and server response timeout timer.

Typically, the next attempt will succeed, because the device has blocked the unreachable servers to shorten the time to find a reachable server.

Make sure the server quiet timer is set correctly. A timer that is too short might result in frequent authentication or accounting failures. This is because the device will continue to attempt to communicate with an unreachable server that is in active state. A timer that is too long might temporarily block a reachable server that has recovered from a failure. This is because the server will remain in blocked state until the timer expires.

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set the interval to 15 minutes or longer.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set RADIUS timers. Choose the following tasks as needed:
   - Set the RADIUS server response timeout timer.
     timer response-timeout *seconds*
     The default setting is 3 seconds.
   - Set the quiet timer for the servers.
     timer quiet *minutes*
     The default setting is 5 minutes.
   - Set the real-time accounting timer.
     timer realtime-accounting *interval* [**second**]
     The default setting is 12 minutes.

Specifying the source IP address for outgoing RADIUS packets

About this task

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS configured on the RADIUS server. A RADIUS server identifies a NAS by its IP address. Upon receiving a RADIUS packet, the RADIUS server checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending a RADIUS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the RADIUS scheme.
2. The source IP address specified in system view for the VPN or public network, depending on where the RADIUS server resides.
3. The IP address of the outbound interface specified by the route.

Restrictions and guidelines for source IP address configuration

You can specify a source IP address for outgoing RADIUS packets in RADIUS scheme view or in system view.

- The IP address specified in RADIUS scheme view applies only to one RADIUS scheme.
- The IP address specified in system view applies to all RADIUS schemes.

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS that is configured on the RADIUS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing RADIUS packets to avoid RADIUS packet loss caused by physical port errors.

The source address of outgoing RADIUS packets is typically the IP address of an egress interface on the NAS to communicate with the RADIUS server.

You can directly specify a source IP address for outgoing RADIUS packets or specify a source interface to provide the source IP address for outgoing RADIUS packets. The source interface configuration and the source IP address configuration overwrite each other.

Specifying a source interface or source IP address for all RADIUS schemes

1. Enter system view.

   system-view

2. Specify a source interface or source IP address for outgoing RADIUS packets.

   radius nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

   By default, the source IP address of an outgoing RADIUS packet is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for a RADIUS scheme

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a source interface or source IP address for outgoing RADIUS packets.

   nas-ip { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing RADIUS packet is that specified by using the **radius nas-ip** command in system view. If the **radius nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

Setting the username format and traffic statistics units

About this task

A username is in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. However, older RADIUS servers might not recognize usernames that contain the ISP domain names. In this case, you can configure the device to remove the domain name of each username to be sent.

The device reports online user traffic statistics in accounting packets. The traffic measurement units are configurable.

Restrictions and guidelines

If two or more ISP domains use the same RADIUS scheme, configure the RADIUS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic statistics units configured on the device and on the RADIUS accounting servers are the same.

Procedure

1. Enter system view.

system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the format for usernames sent to the RADIUS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

   By default, the ISP domain name is included in a username.

   If the device is specified as the RADIUS server in the scheme, the username format must be set to **without-domain**.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Setting the maximum number of RADIUS request transmission attempts

About this task

RADIUS uses UDP packets to transfer data. Because UDP communication is not reliable, RADIUS uses a retransmission mechanism to improve reliability. A RADIUS request is retransmitted if the NAS does not receive a server response for the request within the response timeout timer. For more information about the RADIUS server response timeout timer, see "Setting the status of RADIUS servers."

You can set the maximum number for the NAS to retransmit a RADIUS request to the same server. When the maximum number is reached, the NAS tries to communicate with other RADIUS servers in active state. If no other servers are in active state at the time, the NAS considers the authentication or accounting attempt a failure.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the maximum number of RADIUS request transmission attempts.

   retry *retries*

   By default, the maximum number is 3 for RADIUS request transmission attempts.

Setting the maximum number of real-time accounting attempts

About this task

If you set the maximum number of real-time accounting attempts, the device will disconnect users from whom no accounting responses are received within the permitted attempts.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

radius scheme *radius-scheme-name*

3. Set the maximum number of real-time accounting attempts.
   retry realtime-accounting *retries*
   By default, the maximum number is 5 for real-time accounting attempts.

Setting the DSCP priority for RADIUS packets

About this task

DSCP priority determines the transmission priority of RADIUS packets. A larger value represents a higher priority. DSCP priority is contained in the ToS field of the IPv4 header and in the Traffic Class field of the IPv6 header.

Procedure

1. Enter system view.
   system-view
2. Set the DSCP priority for RADIUS packets.
   radius [**ipv6**] **dscp** *dscp-value*
   By default, the DSCP priority is 0 for RADIUS packets.

Configuring the format of the RADIUS NAS-Port attribute

About this task

The device supports the following formats for the RADIUS NAS-Port attribute (attribute 5):

- **Default format**—Contains the following portions:
  - 8-bit IRF member ID.
  - 4-bit slot number.
  - 8-bit interface index.
  - 12-bit VLAN ID.
- **Port format**—Contains the last segment for the interface number of the interface through which a user accesses the device. For example, if a user accesses the device through GigabitEthernet 1/0/2, 2 is used as the value for the RADIUS NAS-Port attribute.

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the format of the NAS-Port attribute. To ensure correct RADIUS packet exchange, make sure the format of the NAS-Port attribute meets the requirements of the RADIUS servers.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Configure the format of the RADIUS NAS-Port attribute as the port format.
   attribute 5 format port
   By default, the RADIUS NAS-Port attribute uses the default format.

Configuring the Login-Service attribute check method for SSH, FTP, and terminal users

About this task

The Login-Service attribute (RADIUS attribute 15) identifies the service that can be used to connect a user to the device. For example, a value of 0 represents the Telnet service. This attribute is contained in the Access-Accept message sent from the RADIUS server to the device. To log in to the device, the access service type of a RADIUS authentication user must match the Login-Service attribute value in the Access-Accept message.

The RADIUS standards do not assign a Login-Service attribute value for the SSH, FTP, HTTP, HTTPS, or terminal users. To perform service type consistency checks for these types of login users, H3C defines the extended Login-Service attribute values in Table 3.

Table 3 Extended Login-Service attribute values

Attribute value	Service type
50	SSH
51	FTP
52	Terminal
53	HTTP
54	HTTPS

The device provides the following Login-Service attribute check methods:

- **Strict**—Checks the service types of login users based on the standard and extended attribute values. SSH, FTP, HTTP, HTTPS, and terminal users can pass the check only if the Access-Accept messages for them contain the extended Login-Service attribute values specified for them.
- **Loose**—Checks the service types of login users based only on the standard attribute values. SSH, FTP, HTTP, HTTPS, and terminal users pass the check if the attribute value is 0.

Restrictions and guidelines

Use the loose check method if the server does not issue the extended Login-Service attribute values for SSH, FTP, HTTP, HTTPS, and terminal users.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the Login-Service attribute check method for SSH, FTP, and terminal users.

   attribute 15 check-mode { **loose** | **strict** }

   The default check method is strict.

Interpreting the RADIUS class attribute as CAR parameters

About this task

A RADIUS server may deliver CAR parameters for user-based traffic monitoring and control by using the RADIUS class attribute (attribute 25) in RADIUS packets. You can configure the device to interpret the class attribute to CAR parameters.

Procedure

1. Enter system view.

   system-view
2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*
3. Interpret the RADIUS class attribute as CAR parameters.

   attribute 25 car

   By default, the RADIUS class attribute is not interpreted as CAR parameters.

Configuring the MAC address format for the RADIUS Called-Station-Id attribute

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the MAC address format in the RADIUS Called-Station-Id attribute (attribute 30). Configure the MAC address format for this attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view
2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*
3. Configure the MAC address format for the RADIUS Called-Station-Id attribute.

   attribute 30 mac-format section { **one** | { **six** | **three** } **separator** *separator-character* } { **lowercase** | **uppercase** }

   By default, the MAC address in the RADIUS Called-Station-Id attribute is in the format of HH-HH-HH-HH-HH-HH. The MAC address is separated by hyphen (-) into six sections with letters in upper case.

Configuring the MAC address format for the RADIUS Calling-Station-Id attribute

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the MAC address format in the RADIUS Calling-Station-Id attribute (attribute 31). Configure the MAC address format for this attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the MAC address format for the RADIUS Calling-Station-Id attribute.

   attribute 31 mac-format section { **one** | { **six** | **three** } **separator** *separator-character* } { **lowercase** | **uppercase** }

   By default, the MAC address in the RADIUS Calling-Station-Id attribute is in the format of HH-HH-HH-HH-HH-HH. The MAC address is separated by hyphen (-) into six sections with letters in upper case.

Configuring the format of RADIUS attribute 87

About this task

RADIUS attribute 87 is the NAS-Port-Id attribute. This attribute has the following format types:

- **Default format**—The default format varies by user access type.
  - For portal users, the NAS-Port-Id attribute in this format contains the following portions:
    - 2-bit slot number.
    - 2-bit 0s.
    - 3-bit interface index.
    - 9-bit VLAN ID.
  - For 802.1X and MAC authentication users, the NAS-Port-Id attribute is in the format of **slot=***xx***;subslot=***xx***;port=***xx***;vlanid=***xx*.
    - **slot**—IRF member ID.
    - **subslot**—Slot number.
    - **port**—Interface index.
    - **vlanid**—VLAN ID.
  - For login users, the NAS-Port-Id attribute is not included in RADIUS packets.
- **Interface name format**—Contains the name of the interface through which a user accesses the device. For example, if a user accesses the device through GigabitEthernet 1/0/1, GigabitEthernet 1/0/1 is used as the value for the RADIUS NAS-Port-Id attribute.

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the format of the NAS-Port-Id attribute. To ensure correct RADIUS packet exchange, configure the format of the NAS-Port-Id attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the format of RADIUS attribute 87 as the interface name format.

   attribute 87 format interface-name

   By default, the default format is used for RADIUS attribute 87.

Setting the data measurement unit for the Remanent_Volume attribute

About this task

The RADIUS server uses the Remanent_Volume attribute in authentication or real-time accounting responses to notify the device of the current amount of data available for online users.

Restrictions and guidelines

Make sure the configured measurement unit is the same as the user data measurement unit on the RADIUS server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the data measurement unit for the Remanent_Volume attribute.

   attribute remanent-volume unit { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** }

   By default, the data measurement unit is kilobyte.

Including subattribute 218 of vendor 25506 in outgoing RADIUS packets

About this task

The RADIUS Vendor-Specific attribute (attribute 26) allows vendors to define extended attributes to implement functions that the standard RADIUS protocol does not provide. Vendor 25506 defines subattribute 218 to carry user DHCP option information.

To send user DHCP option information to RADIUS servers, perform this task to include subattribute 218 of vendor 25506 in outgoing RADIUS start-accounting and update-accounting requests.

In the current software version, only DHCP Option 55 and DHCP Option 61 can be carried in the subattribute.

Restrictions and guidelines

You can repeat the **include-attribute 218 vendor-id 25506** command to configure the device to encapsulate both DHCP Option 55 and DHCP Option 61 in the subattribute. The length of each option is limited to 246 bytes.

If you repeat this command multiple times with the same DHCP option specified, the most recent configuration takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Include subattribute 218 of vendor 25506 in outgoing RADIUS packets.

   include-attribute 218 vendor-id 25506 dhcp-option { **55** | **61** } * { **format1** | **format2** }

By default, the device uses format 1 to encapsulate DHCP Option 61 in subattribute 218 of vendor 25506 in RADIUS packets.

Configuring the RADIUS attribute translation feature

About this task

The RADIUS attribute translation feature enables the device to work correctly with the RADIUS servers of different vendors that support RADIUS attributes incompatible with the device.

RADIUS attribute translation has the following implementations:

- **Attribute conversion**—Converts source RADIUS attributes into destination RADIUS attributes based on RADIUS attribute conversion rules.
- **Attribute rejection**—Rejects RADIUS attributes based on RADIUS attribute rejection rules.

When the RADIUS attribute translation feature is enabled, the device processes RADIUS packets as follows:

- For the sent RADIUS packets:
  - Deletes the rejected attributes from the packets.
  - Uses the destination RADIUS attributes to replace the attributes that match RADIUS attribute conversion rules in the packets.
- For the received RADIUS packets:
  - Ignores the rejected attributes in the packets.
  - Interprets the attributes that match RADIUS attribute conversion rules as the destination RADIUS attributes.

To identify proprietary RADIUS attributes, you can define the attributes as extended RADIUS attributes, and then convert the extended RADIUS attributes to device-supported attributes.

Restrictions and guidelines for RADIUS attribute translation configuration

Configure either conversion rules or rejection rules for a RADIUS attribute.

Configure either direction-based rules or packet type-based rules for a RADIUS attribute.

For direction-based translation of a RADIUS attribute, you can configure a rule for each direction (inbound or outbound). For packet type-based translation of a RADIUS attribute, you can configure a rule for each RADIUS packet type (RADIUS Access-Accept, RADIUS Access-Request, or RADIUS accounting).

Configuring the RADIUS attribute translation feature for a RADIUS scheme

1. Enter system view.

   system-view

2. (Optional.) Define an extended RADIUS attribute.

   radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute reject rule. Choose the following tasks as needed:
   - Configure a RADIUS attribute conversion rule.

attribute convert *src-attr-name* **to** *dest-attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

By default, no RADIUS attribute conversion rules are configured.

- Configure a RADIUS attribute rejection rule.

  attribute reject *attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

  By default, no RADIUS attribute rejection rules are configured.

Configuring the RADIUS attribute translation feature for a RADIUS DAS

1. Enter system view.

   system-view

2. (Optional.) Define an extended RADIUS attribute.

   radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS DAS view.

   radius dynamic-author server

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute rejection rule. Choose the following tasks as needed:

   - Configure a RADIUS attribute conversion rule.

     attribute convert *src-attr-name* **to** *dest-attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute conversion rules are configured.

   - Configure a RADIUS attribute rejection rule.

     attribute reject *attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute rejection rules are configured.

Configuring RADIUS stop-accounting packet buffering

About this task

The device sends RADIUS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer RADIUS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of transmission attempts that can be made for individual RADIUS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable buffering of RADIUS stop-accounting requests to which no responses have been received.

   stop-accounting-buffer enable

   By default, the buffering feature is enabled.

4. (Optional.) Set the maximum number of transmission attempts for individual RADIUS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 500.

Enabling forcibly sending stop-accounting packets

About this task

Typically, if the device does not send a start-accounting packet to the RADIUS server for an authenticated user, it does not send a stop-accounting packet when the user goes offline. If the server has generated a user entry for the user without start-accounting packets, it does not release the user entry when the user goes offline. This feature forces the device to send stop-accounting packets to the RADIUS server when the user goes offline for timely releasing the user entry on the server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable the device to send stop-accounting packets when users for which no start-accounting packets are sent go offline.

   stop-accounting-packet send-force

   By default, forcibly sending stop-accounting packets is disabled. The device does not send stop-accounting packets when users for which no start-accounting packets are sent go offline.

Enabling the RADIUS server load sharing feature

About this task

By default, the device communicates with RADIUS servers based on the server roles. It first attempts to communicate with the primary server, and, if the primary server is unreachable, it then searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication. In this process, the workload is always placed on the active server.

Use the RADIUS server load sharing feature to dynamically distribute the workload over multiple servers regardless of their server roles. The device forwards an AAA request to the most appropriate server of all active servers in the scheme after it compares the weight values and numbers of currently served users. Specify a weight value for each RADIUS server based on the AAA capacity of the server. A larger weight value indicates a higher AAA capacity.

In RADIUS server load sharing, once the device sends a start-accounting request to a server for a user, it forwards all subsequent accounting requests of the user to the same server. If the accounting server is unreachable, the device returns an accounting failure message rather than searching for another active accounting server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable the RADIUS server load sharing feature.
   server-load-sharing enable
   By default, this feature is disabled.

Specifying a RADIUS server selection mode for reauthentication

About this task

Use this feature to configure the RADIUS server selection mechanism in reauthentication. The following RADIUS server selection modes are available:

- **Inherit**—The device uses the RADIUS server that performed authentication for a user to reauthenticate that user. This mode reduces the amount of time used in reauthentication. However, if the RADIUS server is unreachable, the reauthentication will fail.
- **Reselect**—The device searches for a reachable RADIUS server to reauthenticate a user. This mode requires more time than the inherit mode. However, this mode ensures that the device uses the optimal reachable RADIUS server for reauthentication. The following factors affect the RADIUS server selection:
  - Server configuration in the RADIUS scheme, including the configuration order.
  - Enabling status of the RADIUS server load sharing feature.
  - Status of the RADIUS servers in the RADIUS scheme.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Specify a RADIUS server selection mode for reauthentication.
   reauthentication server-select { **inherit** | **reselect** }
   By default, the inherit mode is used.

Configuring the RADIUS accounting-on feature

About this task

When the accounting-on feature is enabled, the device automatically sends an accounting-on packet to the RADIUS server after the entire device reboots. Upon receiving the accounting-on packet, the RADIUS server logs out all online users so they can log in again through the device. Without this feature, users cannot log in again after the reboot, because the RADIUS server considers them to come online.

You can configure the interval for which the device waits to resend the accounting-on packet and the maximum number of retries.

The extended accounting-on feature enhances the accounting-on feature in a distributed architecture.

The extended accounting-on feature is applicable to LAN users. The user data is saved to the IRF member devices through which the users access the system. When the extended accounting-on feature is enabled, the system automatically sends an accounting-on packet to the RADIUS server after a member device reboots. The packet contains the member device identifier. Upon receiving

the accounting-on packet, the RADIUS server logs out all online users that access the system through the member device. If no users have come online through the member device, the IRF fabric does not send an accounting-on packet after the member device reboots.

Restrictions and guidelines

For the extended accounting-on feature to take effect, the RADIUS server must run on IMC and the accounting-on feature must be enabled.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable accounting-on.
   accounting-on enable [**interval** *interval* | **send** *send-times*] *
   By default, the accounting-on feature is disabled.
4. (Optional.) Enable extended accounting-on.
   accounting-on extended
   By default, extended accounting-on is disabled.

Configuring the RADIUS session-control feature

About this task

Enable this feature for the RADIUS server to dynamically change the user authorization information (for example, authorization ACL, VLAN, user group, or blackhole MAC) or forcibly disconnect users by using session-control packets. This task enables the device to receive RADIUS session-control packets on UDP port 1812.

To verify the session-control packets sent from a RADIUS server, specify the RADIUS server as a session-control client to the device.

Restrictions and guidelines

The RADIUS session-control feature can only work with RADIUS servers running on IMC. The session-control client configuration takes effect only when the session-control feature is enabled.

Procedure

1. Enter system view.
   system-view
2. Enable the session-control feature.
   radius session-control enable
   By default, the session-control feature is disabled.
3. Specify a session-control client.
   radius session-control client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *
   By default, no session-control clients are specified.

Configuring the RADIUS DAS feature

About this task

Dynamic Authorization Extensions (DAE) to RADIUS, defined in RFC 5176, can log off online users and change online user authorization information.

In a RADIUS network, the RADIUS server typically acts as the DAE client (DAC) and the NAS acts as the DAE server (DAS).

When the RADIUS DAS feature is enabled, the NAS performs the following operations:

1. Listens to the default or specified UDP port to receive DAE requests.
2. Logs off online users that match the criteria in the requests, changes their authorization information, shuts down or reboots their access ports, or reauthenticates the users.
3. Sends DAE responses to the DAC.

DAE defines the following types of packets:

- **Disconnect Messages (DMs)**—The DAC sends DM requests to the DAS to log off specific online users.
- **Change of Authorization Messages (CoA Messages)**—The DAC sends CoA requests to the DAS to change the authorization information of specific online users.

Procedure

1. Enter system view.

   system-view

2. Enable the RADIUS DAS feature and enter RADIUS DAS view.

   radius dynamic-author server

   By default, the RADIUS DAS feature is disabled.

3. Specify a RADIUS DAC.

   client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name* | { **message-authenticator** **force-mode** { **reply** | **request** | **request-reply** } | **ssl-server-policy** *policy-name* }]*

   By default, no RADIUS DACs are specified.

4. (Optional.) Specify the RADIUS DAS port.

   port *port-number*

   By default, the RADIUS DAS port is 3799.

5. (Optional.) Set the idle timeout for TLS connections of the RADIUS DAE service.

   timer tls-idle-timeout *timeout-value*

   By default, the idle timeout is 60 seconds for TLS connections.

6. (Optional.) Specify the TLS connection listening port for the RADIUS DAE service.

   tls-port *port-number*

   By default, the TLS connection listening port for the RADIUS DAE service is 2083.

Configuring the device to preferentially process RADIUS authentication requests

About this task

RADIUS requests include RADIUS authentication requests, RADIUS accounting-start requests, RADIUS accounting-update requests, and RADIUS accounting-stop requests. By default, the device processes the RADIUS requests in the sequence that the requests are initiated.

When a large number of users go offline and then try to come online immediately, authentication might fail for these users because of authentication request timeout. To resolve this issue, configure the device to preferentially process authentication requests.

Restrictions and guidelines

Do not perform this task if the RADIUS server identifies users by the username and does not allow repeated authentication for the same username. A violation might cause authentication failure for users that try to come online immediately after going offline.

As a best practice, do not perform this task when the device has online users.

Procedure

1. Enter system view.

   `system-view`
2. Configure the device to preferentially process RADIUS authentication requests.

   `radius authentication-request first`

   By default, the device processes RADIUS requests in the sequence that the requests are initiated.

Enabling SNMP notifications for RADIUS

About this task

When SNMP notifications are enabled for RADIUS, the SNMP agent supports the following notifications generated by RADIUS:

- **RADIUS server unreachable notification**—The RADIUS server cannot be reached. RADIUS generates this notification if it does not receive a response to an accounting or authentication request within the specified number of RADIUS request transmission attempts.
- **RADIUS server reachable notification**—The RADIUS server can be reached. RADIUS generates this notification for a previously blocked RADIUS server after the quiet timer expires.
- **Excessive authentication failures notification**—The number of authentication failures compared to the total number of authentication attempts exceeds the specified threshold.

For RADIUS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Make sure the RADIUS server status change notifications sent by the device can be recognized by the NMS. Choose a MIB node version depending on the NMS requirements. For more information about the MIB node versions, see AAA in *Security Command Reference*.

Procedure

1. Enter system view.

   `system-view`
2. Enable SNMP notifications for RADIUS.

snmp-agent trap enable radius [**accounting-server-down** | **accounting-server-up** | **authentication-error-threshold** | **authentication-server-down** | **authentication-server-up**] *

By default, all SNMP notifications are disabled for RADIUS.

3. Set the version of RADIUS server status change MIB nodes.

radius trap-version { **v1** | **v2** } [**accounting-server-down** | **accounting-server-up** | **authentication-server-down** | **authentication-server-up**] *

By default, the device sends notifications about RADIUS server status change MIB nodes over SNMPv1.

Disabling the RADIUS service

About this task

By default, the RADIUS service is enabled. The device can send and receive RADIUS packets. Attackers might use RADIUS session-control and DAE ports to attack the device. To protect the device when such an attack occurs, disable the RADIUS service temporarily on the device. After the network is secure, re-enable the RADIUS service.

If settings on the RADIUS servers require modification or the RADIUS servers cannot provide services temporarily, you can temporarily disable the RADIUS service on the device.

When the RADIUS service is disabled, the device stops sending and receiving RADIUS packets. If a new user comes online, the device uses the backup authentication, authorization, or accounting method to process that user. If the device has not finished requesting authentication or accounting for a user before the RADIUS service is disabled, it uses the following rules to process that user:

- If the device has sent RADIUS authentication requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it uses the response to determine whether that user has passed authentication. If that user has passed authentication, the device assigns authorization information to that user according to the response.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup authentication method to authenticate that user.
- If the device has sent RADIUS start-accounting requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it allows that user to come online. However, the device cannot send out accounting-update or stop-accounting requests to the RADIUS server. It cannot buffer the accounting requests, either. When that user goes offline, the RADIUS server cannot log off that user in time. The accounting result might be inaccurate.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup accounting method.

Restrictions and guidelines

Disabling the RADIUS service does not affect the RADIUS server feature of the device.

The authentication, authorization, and accounting processes undertaken by other methods are not switched to RADIUS when you re-enable the RADIUS service.

Procedure

1. Enter system view.

system-view

2. Disable the RADIUS service.

   undo radius enable

   By default, the RADIUS service is enabled.

   To re-enable the RADIUS service, use the **radius enable** command.

Enabling RADIUS server parallel authentication

About this task

The implementation of this feature varies by authentication methods as follows:

- For 802.1X EAP termination authentication or MAC authentication, the device sends authentication requests to all active servers simultaneously, without distinguishing between primary and secondary servers.
  - When the device receives a response that indicates authentication success from any server, the user authentication is considered successful. Authentication is only deemed failed if all active servers respond with a failure.
  - If no server responds, the fail-permit process is triggered to authenticate the user.
- For 802.1X EAP relay authentication, the device uses a primary-backup server approach for authentication. If the primary server responds with an authentication failure, the device checks whether any other active servers exist. If another active server exists, the device sends an authentication request to the server for re-authentication. If no active servers are available, the user authentication is considered failed.

  During this process, an authentication request is sent to the next active server only if the previous server responds with a failure or does not respond.
  - If any server responds with successful authentication, the user authentication is considered successful.
  - If none of the servers respond with successful authentication and one or more servers fail to respond, the fail-permit process is triggered to authenticate the user.
  - If all servers respond with an authentication failure, the user authentication is deemed failed.

Restrictions and guidelines

When both this feature and RADIUS server load sharing (**server-load-sharing enable**) are enabled, RADIUS server load sharing does not take effect.

When both this feature and the RADIUS server selection mode for reauthentication (configured via the reauthentication server-select command) are configured, the RADIUS server selection mode for reauthentication does not take effect.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable RADIUS server parallel authentication.

   server-parallel-auth enable

   By default, RADIUS server parallel authentication is disabled.

Configuring authentication and accounting packets to carry attribute Message-Authenticator numbered 80

About this task

The authentication and accounting requests sent by RADIUS clients do not carry attribute Message-Authenticator numbered 80. Such authentication and accounting requests might be insecure. To ensure security, you can perform this task to configure forced carrying of the attribute as needed.

Without this feature, the authentication and accounting requests sent by RADIUS clients do not carry the Message-Authenticator attribute. At the same time, if a RADIUS client receives a RADIUS authentication or accounting response that carries the attribute, the client verifies the attribute. If the response does not carry the attribute, the client does not verify the attribute.

Restrictions and guidelines

If you perform this task to require RADIUS responses to carry the attribute, you must also configure **radius-server message-authenticator force-reply** on the local RADIUS server. If you do not do so, RADIUS clients might drop the RADIUS responses.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure authentication packets to carry attribute Message-Authenticator numbered 80.

   auth-attribute message-authenticator force-mode { **request** | **request-reply** }

   By default, the authentication packets do not carry attribute Message-Authenticator numbered 80.

4. Configure accounting packets to carry attribute Message-Authenticator numbered 80.

   acct-attribute message-authenticator force-mode { **request** | **request-reply** }

   By default, the accounting packets do not carry attribute Message-Authenticator numbered 80.

Configure the idle timeout for TLS connections in RADIUS authentication

About this task

After the device processes the last authentication or accounting request, it uses the idle timeout configured for TLS connections in the RADIUS scheme of the last request to update the idle timeout timer. If the timer expires but no authentication or accounting request is received, the system disconnects the TLS connection. Setting the idle timeout to 0 disables the system from disconnecting TLS connections due to timeout.

If you change the idle timeout under a RADIUS scheme from 0 to a non-zero value, the system traverses the connections of the servers under the scheme and updates the idle timeout to the new value.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Specify the idle timeout for TLS connections in RADIUS authentication.
   timer tls-idle-timeout *timeout-value*
   By default, the idle timeout is 60 seconds for TLS connections in RADIUS authentication.

Display and maintenance commands for RADIUS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about globally cached RADIUS packets.	**display radius buffer**
Display the RADIUS scheme configuration.	**display radius scheme** [*radius-scheme-name*]
Display authentication and accounting load statistics for all RADIUS servers.	**display radius server-load statistics**
Display RADIUS packet statistics.	**display radius statistics**
Display information about buffered RADIUS stop-accounting requests to which no responses have been received.	**display stop-accounting-buffer** { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }
Clear history authentication and accounting load statistics for all RADIUS servers.	**reset radius server-load statistics**
Clear RADIUS statistics.	**reset radius statistics**
Clear the buffered RADIUS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer** { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }

Configuring HWTACACS

HWTACACS tasks at a glance

To configure HWTACACS, perform the following tasks:

1. Creating an HWTACACS scheme
2. Specifying the HWTACACS authentication servers
3. Specifying the HWTACACS authorization servers
4. Specifying the HWTACACS accounting servers
5. Specifying the shared keys for secure HWTACACS communication
   Perform this task if no shared keys are specified when configuring HWTACACS servers.
6. Specifying an MPLS L3VPN instance for the scheme
   Perform this task if no MPLS L3VPN instances are specified when configuring HWTACACS servers.

7. (Optional.) Setting HWTACACS timers
8. (Optional.) Configuring parameters for HWTACACS packets
   - Specifying the source IP address for outgoing HWTACACS packets
   - Setting the username format and traffic statistics units
   - Setting the DSCP priority for HWTACACS packets
9. (Optional.) Configuring HWTACACS stop-accounting packet buffering
10. (Optional.) Enabling SNMP notifications for HWTACACS

Creating an HWTACACS scheme

Restrictions and guidelines

You can configure a maximum of 16 HWTACACS schemes. An HWTACACS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view
2. Create an HWTACACS scheme and enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

Specifying the HWTACACS authentication servers

About this task

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for an HWTACACS scheme. When the primary server is unreachable, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authentication server in one scheme and as the secondary authentication server in another scheme at the same time.

Two HWTACACS authentication servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view
2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*
3. Specify the primary HWTACACS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no primary HWTACACS authentication server is specified.
4. (Optional.) Specify a secondary HWTACACS authentication server.

secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

By default, no secondary HWTACACS authentication servers are specified.

Specifying the HWTACACS authorization servers

About this task

You can specify one primary authorization server and a maximum of 16 secondary authorization servers for an HWTACACS scheme. When the primary server is not available, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authorization server of one scheme and as the secondary authorization server of another scheme at the same time.

Two HWTACACS authorization servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS authorization server.

   primary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no primary HWTACACS authorization server is specified.

4. (Optional.) Specify a secondary HWTACACS authorization server.

   secondary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no secondary HWTACACS authorization servers are specified.

Specifying the HWTACACS accounting servers

About this task

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for an HWTACACS scheme. When the primary server is not available, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary accounting server of one scheme and as the secondary accounting server of another scheme at the same time.

Two HWTACACS accounting servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

HWTACACS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS accounting server.

   primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no primary HWTACACS accounting server is specified.

4. (Optional.) Specify a secondary HWTACACS accounting server.

   secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no secondary HWTACACS accounting servers are specified.

Specifying the shared keys for secure HWTACACS communication

About this task

The HWTACACS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

Perform this task to configure shared keys for servers in an HWTACACS scheme. The keys take effect on all servers for which a shared key is not individually configured.

Restrictions and guidelines

Make sure the shared key configured on the device is the same as the shared key configured on the HWTACACS server.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a shared key for secure HWTACACS authentication, authorization, or accounting communication.

   key { **accounting** | **authentication** | **authorization** } { **cipher** | **simple** } *string*

   By default, no shared key is specified for secure HWTACACS communication.

Specifying an MPLS L3VPN instance for the scheme

About this task

The VPN instance specified for an HWTACACS scheme applies to all servers in that scheme. If a VPN instance is also configured for an individual HWTACACS server, the VPN instance specified for the HWTACACS scheme does not take effect on that server.

Procedure

1. Enter system view.
   system-view
2. Enter HWTACACS scheme view.
   hwtacacs scheme *hwtacacs-scheme-name*
3. Specify a VPN instance for the HWTACACS scheme.
   vpn-instance *vpn-instance-name*
   By default, an HWTACACS scheme belongs to the public network.

Setting HWTACACS timers

About this task

The device uses the following timers to control communication with an HWTACACS server:

- **Server response timeout timer (response-timeout)**—Defines the HWTACACS server response timeout timer. The device starts this timer immediately after an HWTACACS authentication, authorization, or accounting request is sent. If the device does not receive a response from the server within the timer, it sets the server to blocked. Then, the device sends the request to another HWTACACS server.
- **Real-time accounting timer (realtime-accounting)**—Defines the intervals at which the device sends real-time accounting packets to the HWTACACS accounting server for online users.
- **Server quiet timer (quiet)**—Defines the duration to keep an unreachable server in blocked state. If a server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.

The server quiet timer setting affects the status of HWTACACS servers. If the scheme includes one primary HWTACACS server and multiple secondary HWTACACS servers, the device communicates with the HWTACACS servers based on the following rules:

- When the primary server is in active state, the device communicates with the primary server. When the primary server is unreachable, the device researches a secondary server in active status in the order they are configured.
- When one or more servers are in active state, the device tries to communicate with these servers only, even if they are unreachable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If the primary server is unreachable, the device changes the server status to blocked and starts a quiet timer for the server. When the quiet timer of the server expires, the status of the server changes back to active. The device does not check the server again during the authentication, authorization, or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is available, the device considers the authentication, authorization, or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When an HWTACACS server's status changes automatically, the device changes this server's status accordingly in all HWTACACS schemes in which this server is specified.

Restrictions and guidelines

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set a real-time accounting interval longer than 15 minutes.

Procedure

1. Enter system view.
   system-view
2. Enter HWTACACS scheme view.
   hwtacacs scheme *hwtacacs-scheme-name*
3. Set the HWTACACS timers. Choose the following tasks as needed:
   - Set the HWTACACS server response timeout timer.
     timer response-timeout *seconds*
     By default, the HWTACACS server response timeout timer is 5 seconds.
   - Set the real-time accounting interval.
     timer realtime-accounting *minutes*
     By default, the real-time accounting interval is 12 minutes.
   - Set the server quiet timer.
     timer quiet *minutes*
     By default, the server quiet timer is 5 minutes.

Specifying the source IP address for outgoing HWTACACS packets

About this task

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS configured on the HWTACACS server. An HWTACACS server identifies a NAS by IP address. When the HWTACACS server receives a packet, it checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending an HWTACACS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the HWTACACS scheme.
2. The source IP address specified in system view for the VPN or public network, depending on where the HWTACACS server resides.
3. The IP address of the outbound interface specified by the route.

Restrictions and guidelines for source IP address configuration

You can specify the source IP address for outgoing HWTACACS packets in HWTACACS scheme view or in system view.

- The IP address specified in HWTACACS scheme view applies to one HWTACACS scheme.
- The IP address specified in system view applies to all HWTACACS schemes.

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS that is configured on the HWTACACS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing HWTACACS packets to avoid HWTACACS packet loss caused by physical port errors.

To communicate with the HWTACACS server, the source address of outgoing HWTACACS packets is typically the IP address of an egress interface on the NAS.

You can directly specify a source IP address for outgoing HWTACACS packets or specify a source interface to provide the source IP address for outgoing HWTACACS packets. The source interface configuration and the source IP address configuration overwrite each other.

Specifying a source interface or source IP address for all HWTACACS schemes

1. Enter system view.

   system-view

2. Specify a source interface or source IP address for outgoing HWTACACS packets.

   hwtacacs nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

   By default, the source IP address of an HWTACACS packet sent to the server is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for an HWTACACS scheme

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a source interface or source IP address for outgoing HWTACACS packets.

   nas-ip { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing HWTACACS packet is that configured by using the **hwtacacs nas-ip** command in system view. If the **hwtacacs nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

Setting the username format and traffic statistics units

About this task

A username is typically in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. If HWTACACS servers do not recognize usernames that contain ISP domain names, you can configure the device to send usernames without domain names to the servers.

The device reports online user traffic statistics in accounting packets.

Restrictions and guidelines

If two or more ISP domains use the same HWTACACS scheme, configure the HWTACACS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic measurement units configured on the device are the same as the traffic measurement units configured on the HWTACACS accounting servers.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Set the format of usernames sent to the HWTACACS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

By default, the ISP domain name is included in a username.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Setting the DSCP priority for HWTACACS packets

About this task

DSCP priority determines the transmission priority of HWTACACS packets. A larger value represents a higher priority.

DSCP priority is contained in the ToS field of the IPv4 header and in the Traffic Class field of the IPv6 header.

Procedure

1. Enter system view.

   system-view

2. Set the DSCP priority for HWTACACS packets.

   hwtacacs [**ipv6**] **dscp** *dscp-value*

   By default, the DSCP priority is 0 for HWTACACS packets.

Configuring HWTACACS stop-accounting packet buffering

About this task

The device sends HWTACACS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer HWTACACS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of attempts that can be made for transmitting individual HWTACACS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Enable buffering of HWTACACS stop-accounting requests to which no responses have been received.

   stop-accounting-buffer enable

   By default, the buffering feature is enabled.

4. (Optional.) Set the maximum number of transmission attempts for individual HWTACACS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 100.

Enabling SNMP notifications for HWTACACS

About this task

When SNMP notifications are enabled for HWTACACS, the SNMP agent supports the following notifications generated by HWTACACS:

- **HWTACACS server unreachable notification**—The HWTACACS server cannot be reached. HWTACACS generates this notification if it does not receive a response to an accounting or authentication request within the specified number of HWTACACS request transmission attempts.
- **HWTACACS server reachable notification**—The HWTACACS server can be reached. HWTACACS generates this notification for a previously blocked HWTACACS server after the quiet timer expires.

For HWTACACS SNMP notifications to be sent correctly, you must also configure HWTACACS on the device. For more information about HWTACACS configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Make sure the RADIUS server status change notifications sent by the device can be recognized by the NMS. Choose a MIB node version depending on the NMS requirements. For more information about the MIB node versions, see AAA in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for HWTACACS.

   snmp-agent trap enable hwtacacs [**accounting-server-down** | **accounting-server-up** | **authentication-server-down** | **authentication-server-up** | **authorization-server-down** | **authorization-server-up**] *

   By default, SNMP notifications for HWTACACS are disabled.

Display and maintenance commands for HWTACACS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the configuration or server statistics of HWTACACS schemes.	**display hwtacacs scheme** [*hwtacacs-scheme-name* [**statistics**]]
Display information about buffered HWTACACS stop-accounting requests to which no responses have been received.	**display stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*
Display HWTACACS packet statistics.	**display hwtacacs statistics**
Clear HWTACACS statistics.	**reset hwtacacs statistics** { **accounting** | **all** | **authentication** | **authorization** }
Clear the buffered HWTACACS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*

Configuring LDAP

LDAP tasks at a glance

To configure LDAP, perform the following tasks:

1. Configuring an LDAP server
   a. Creating an LDAP server
   b. Configuring the IP address of the LDAP server
   c. (Optional.) Specifying the LDAP version
   d. (Optional.) Setting the LDAP server timeout period
   e. Configuring administrator attributes
   f. Configuring LDAP user attributes
2. (Optional.) Configuring an LDAP attribute map
3. Creating an LDAP scheme
4. Specifying the LDAP authentication server
5. (Optional.) Specifying the LDAP authorization server
6. (Optional.) Specifying an LDAP attribute map for LDAP authorization

Creating an LDAP server

1. Enter system view.
   system-view
2. Create an LDAP server and enter LDAP server view.
   ldap server *server-name*

Configuring the IP address of the LDAP server

Restrictions and guidelines

You can configure either an IPv4 address or an IPv6 address for an LDAP server. If you configure the IP address for an LDAP server multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Configure the IP address of the LDAP server.
   { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]
   By default, an LDAP server does not have an IP address.

Specifying the LDAP version

Restrictions and guidelines

The device supports LDAPv2 and LDAPv3.

A Microsoft LDAP server supports only LDAPv3.

The LDAP version specified on the device must be consistent with the version specified on the LDAP server.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the LDAP version.
   protocol-version { **v2** | **v3** }
   By default, LDAPv3 is used.

Setting the LDAP server timeout period

About this task

If the device sends a bind or search request to an LDAP server without receiving the server's response within the server timeout period, the authentication or authorization request times out. Then, the device tries the backup authentication or authorization method. If no backup method is configured in the ISP domain, the device considers the authentication or authorization attempt a failure.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Set the LDAP server timeout period.
   server-timeout *time-interval*
   By default, the LDAP server timeout period is 10 seconds.

Configuring administrator attributes

About this task

To configure the administrator DN and password for binding with the LDAP server during LDAP authentication:

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the administrator DN.
   login-dn *dn-string*
   By default, no administrator DN is specified.
   The administrator DN specified on the device must be the same as the administrator DN configured on the LDAP server.
4. Configure the administrator password.

login-password { **cipher** | **simple** } *string*

By default, no administrator password is specified.

Configuring LDAP user attributes

About this task

To authenticate a user, an LDAP client must complete the following operations:

1. Establish a connection to the LDAP server.
2. Obtain the user DN from the LDAP server.
3. Use the user DN and the user's password to bind with the LDAP server.

LDAP provides a DN search mechanism for obtaining the user DN. According to the mechanism, an LDAP client sends search requests to the server based on the search policy determined by the LDAP user attributes of the LDAP client.

The LDAP user attributes include:

- Search base DN.
- Search scope.
- Username attribute.
- Username format.
- User object class.

Restrictions and guidelines

If the LDAP server contains many directory levels, a user DN search starting from the root directory can take a long time. To improve efficiency, you can change the start point by specifying the search base DN.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the user search base DN.
   search-base-dn *base-dn*
   By default, no user search base DN is specified.
4. (Optional.) Specify the user search scope.
   search-scope { **all-level** | **single-level** }
   By default, the user search scope is **all-level**.
5. (Optional.) Specify the username attribute.
   user-parameters user-name-attribute { *name-attribute* | **cn** | **uid** }
   By default, the username attribute is **cn**.
6. (Optional.) Specify the username format.
   user-parameters user-name-format { **with-domain** | **without-domain** }
   By default, the username format is **without-domain**.
7. (Optional.) Specify the user object class.
   user-parameters user-object-class *object-class-name*
   By default, no user object class is specified, and the default user object class on the LDAP server is used. The default user object class for this command varies by server model.

Configuring an LDAP attribute map

About this task

Configure an LDAP attribute map to define a list of LDAP-AAA attribute mapping entries. To apply the LDAP attribute map, specify the name of the LDAP attribute map in the LDAP scheme used for authorization.

The LDAP attribute map feature enables the device to convert LDAP attributes obtained from an LDAP authorization server to device-recognizable AAA attributes based on the mapping entries. Because the device ignores unrecognized LDAP attributes, configure the mapping entries to include important LDAP attributes that should not be ignored.

An LDAP attribute can be mapped only to one AAA attribute. Different LDAP attributes can be mapped to the same AAA attribute.

Procedure

1. Enter system view.
   system-view
2. Create an LDAP attribute map and enter LDAP attribute map view.
   ldap attribute-map *map-name*
3. Configure a mapping entry.
   map ldap-attribute *ldap-attribute-name* [**prefix** *prefix-value* **delimiter** *delimiter-value*] **aaa-attribute** { **user-group** | **user-profile** }

Creating an LDAP scheme

Restrictions and guidelines

You can configure a maximum of 16 LDAP schemes. An LDAP scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.
   system-view
2. Create an LDAP scheme and enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*

Specifying the LDAP authentication server

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify the LDAP authentication server.
   authentication-server *server-name*
   By default, no LDAP authentication server is specified.

Specifying the LDAP authorization server

1. Enter system view.

system-view

2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify the LDAP authorization server.
   authorization-server *server-name*
   By default, no LDAP authorization server is specified.

Specifying an LDAP attribute map for LDAP authorization

About this task

Specify an LDAP attribute map for LDAP authorization to convert LDAP attributes obtained from the LDAP authorization server to device-recognizable AAA attributes.

Restrictions and guidelines

You can specify only one LDAP attribute map in an LDAP scheme.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify an LDAP attribute map.
   attribute-map *map-name*
   By default, no LDAP attribute map is specified.

Display and maintenance commands for LDAP

Execute **display** commands in any view.

Task	Command
Display the configuration of LDAP schemes.	**display ldap scheme** [*ldap-scheme-name*]

Creating an ISP domain

About ISP domains

In a networking scenario with multiple ISPs, the device can connect to users of different ISPs. These users can have different user attributes, such as different username and password structures, different service types, and different rights. To manage users of different ISPs, configure authentication, authorization, and accounting methods and domain attributes for each ISP domain as needed.

The device supports a maximum of 16 ISP domains, including the system-defined ISP domain **system**. You can specify one of the ISP domains as the default domain.

On the device, each user belongs to an ISP domain. If a user does not provide an ISP domain name at login, the device considers the user belongs to the default ISP domain.

Each ISP domain has a set of system-defined AAA methods, which are local authentication, local authorization, and local accounting. If you do not configure any AAA methods for an ISP domain, the device uses the system-defined AAA methods for users in the domain.

The device chooses an authentication domain for each user in the following order:

1. The authentication domain specified for the access module.
2. The ISP domain in the username.
3. The default ISP domain of the device.

If the chosen domain does not exist on the device, the device searches for the ISP domain that accommodates users assigned to nonexistent domains. (Support for the authentication domain configuration depends on the access module.) If no such ISP domain is configured, user authentication fails.

Restrictions and guidelines for ISP domain configuration

An ISP domain cannot be deleted when it is the default ISP domain. Before you use the **undo domain** command, change the domain to a non-default ISP domain by using the **undo domain default enable** command.

You can modify the settings of the system-defined ISP domain **system**, but you cannot delete the domain.

To avoid RADIUS authentication, authorization, or accounting failures, use short domain names to ensure that usernames containing a domain name do not exceed 253 characters.

To avoid RADIUS accounting failures, make sure the domain name contained in usernames sent to the RADIUS server does not exceed 247 characters.

Creating an ISP domain

1. Enter system view.
   system-view
2. Create an ISP domain and enter ISP domain view.
   domain *isp-name*
   By default, a system-defined ISP domain exists. The domain name is **system**.

Specifying the default ISP domain

1. Enter system view.
   system-view
2. Specify the default ISP domain.
   domain default enable *isp-name*
   By default, the default ISP domain is the system-defined ISP domain **system**.

Specifying an ISP domain for users that are assigned to nonexistent domains

1. Enter system view.
   system-view
2. Specify the ISP domain to accommodate users that are assigned to nonexistent domains.
   domain if-unknown *isp-name*

By default, no ISP domain is specified to accommodate users that are assigned to nonexistent domains.

Configuring ISP domain attributes

Setting ISP domain status

About this task

By placing the ISP domain in active or blocked state, you allow or deny network service requests from users in the domain.

Procedure

1. Enter system view.
   system-view
2. Enter ISP domain view.
   domain *isp-name*
3. Set the status of the ISP domain.
   state { **active** | **block** }
   By default, an ISP domain is in active state, and users in the domain can request network services.

Configuring authorization attributes for an ISP domain

About this task

The device supports the following authorization attributes:

- **ACL**—The device restricts authenticated users to access only the network resources permitted by the ACL.
- **CAR action**—The attribute controls the traffic flow of authenticated users.
- **Maximum number of multicast groups**—The attribute restricts the maximum number of multicast groups that an authenticated user can join concurrently.
- **IPv4 address pool**—The device assigns IPv4 addresses from the pool to authenticated users in the domain.
- **IPv6 address pool**—The device assigns IPv6 addresses from the pool to authenticated users in the domain.
- **Redirect URL**—The device redirects users in the domain to the URL after they pass authentication.
- **User group**—Authenticated users in the domain obtain all attributes of the user group.
- **User profile**—The device restricts the user's behavior based on the user profile.
- **VLAN**—The device authorizes the authenticated users to access the network resources in the specified VLAN.

Restrictions and guidelines

If the idle cut attribute is configured in an ISP domain, the device assigns the attribute to the authenticated users in the domain. If no idle cut attribute is configured in the ISP domain, the device uses the idle cut attribute assigned by the server.

When you specify matching rules for user terminals, follow these restrictions and guidelines:

- Vertical bars (|) are used as the delimiter in matching rules and cannot be input as part of a rule.

- Do not input vertical bars (|) consecutively, such as ||, |||, or | |.
- Matching rules can include spaces, but spaces do not participate in the match and will occupy string length.

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. Configure authorization attributes for authenticated users in the ISP domain.

   authorization-attribute { **acl** *acl-number* | **car inbound cir** *committed-information-rate* [**pir** *peak-information-rate*] **outbound cir** *committed-information-rate* [**pir** *peak-information-rate*] | **igmp max-access-number** *max-access-number* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **ipv6-prefix** *ipv6-prefix prefix-length* | **mld max-access-number** *max-access-number* | **redirect** { **deny** | **permit** } **user-agent match** *match-string* | **url** *url-string* | **user-group** *user-group-name* | **user-profile** *profile-name* | **vlan** *vlan-id* }

   The default settings are as follows:

   - An IPv4 user can concurrently join a maximum of four IGMP multicast groups.
   - An IPv6 user can concurrently join a maximum of four MLD multicast groups.
   - No other authorization attributes exist.

Including the idle timeout period in the user online duration to be sent to the server

About this task

If a user goes offline due to connection failure or malfunction, the user's online duration sent to the server includes the idle timeout period assigned by the authorization server. The online duration generated on the server is longer than the actual online duration of the user.

For portal users, the device includes the idle timeout period set for the online portal user detection feature in the user online duration. For more information about online detection for portal users, see "Configuring portal authentication."

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. Configure the device to include the idle timeout period in the user online duration to be sent to the server.

   session-time include-idle-time

   By default, the user online duration sent to the server does not include the idle timeout period.

Enabling temporary redirect

About this task

Typically, the device carries the redirect URL coded in JavaScript in HTTP or HTTPS responses sent to users, and the status code in the responses is 200. The users obtain the redirect URL by parsing the JavaScript codes. If the endpoint of a user (application, for example) does not support JavaScript, the user will fail to be redirected.

To resolve this issue, enable the temporary redirect feature. This feature enables the device to send HTTP or HTTPS responses with status code 302 to users so that the users can obtain the redirect URL.

Restrictions and guidelines

As a best practice, enable this feature only when users that do not support decoding Java Script in HTTP/HTTPS packets exist in the network.

This feature takes effect only on wired 802.1X and MAC authentication users authorized with a redirection URL.

If you change the temporary redirect setting, the change takes effect only on users that come online afterwards or users that are reauthorized.

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. Enable temporary redirect.

   redirect move-temporarily enable

   By default, temporary redirect is disabled.

Configuring the authentication failure policy for users in an ISP domain

About this task

By default, users cannot come online if they fail authentication. To have authentication-failed users in an authentication domain stay online and access a limited set of network resources, specify an auth-fail domain to accommodate them. In the auth-fail domain, you can specify a set of authorization and accounting schemes to assign resources to the authentication-failed users.

Restrictions and guidelines

The authen-fail online feature is applicable only to wired 802.1X, Web authentication, and MAC authentication users.

The authen-fail online feature does not apply to users that fail authentication for one of the following reasons:

- Authentication times out, for example, because no authentication servers respond or no matching local users are found.
- The authentication domain is in blocked state or is a denied domain.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. Configure the authentication failure policy for users in the ISP domain.

   authen-fail { **offline** | **online domain** *new-isp-name* **no-authen** }

   By default, the device logs out users in an ISP domain if the users fail authentication.

Configuring AAA methods for an ISP domain

Configuring authentication methods for an ISP domain

Restrictions and guidelines

When you configure remote authentication, follow these restrictions and guidelines:

- For high availability, you can specify one primary authentication method and multiple backup authentication methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local none** parameters specify a primary RADIUS authentication method and two backup methods (local authentication and no authentication). The device performs RADIUS authentication by default and performs local authentication when the RADIUS server is invalid. The device does not perform authentication when both of the previous methods are invalid.

  The remote authentication method is invalid in the following situations:

  - The specified authentication scheme does not exist.
  - The device fails to send authentication request packets.
  - The device does not receive any authentication response packets from an authentication server.

  The local authentication method is invalid if the device fails to find the matching local user configuration.
- If the authentication method uses a RADIUS scheme and the authorization method does not use a RADIUS scheme, AAA accepts only the authentication result from the RADIUS server. The Access-Accept message from the RADIUS server also includes the authorization information, but the device ignores the information.
- If an HWTACACS scheme is specified, the device uses the entered username for role authentication. If a RADIUS scheme is specified, the device uses username **$enab***n***$** on the RADIUS server for role authentication. The variable *n* represents a user role level. For more information about user role authentication, see *Fundamentals Configuration Guide*.

The **none** keyword is not supported in FIPS mode.

When the primary authentication method is local, the following rules apply to the authentication of a user:

- The device uses the backup authentication methods in sequence only if local authentication is invalid for one of the following reasons:
  - An exception occurs in the local authentication process.
  - The device connection is terminated or the user account is not configured on the device.
- The device does not turn to the backup authentication methods if local authentication is invalid because of any other reason. Authentication fails for the user.

Prerequisites

Before configuring authentication methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authentication method for each access type and service type.

2. Determine whether to configure the default authentication method for all access types or service types. The default authentication method applies to all access users. However, the method has a lower priority than the authentication method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authentication methods for all types of users.

   authentication default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **local** [**ldap-scheme** *ldap-scheme-name*] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the default authentication method is **local**.

4. Specify authentication methods for a user type or a service.
   - Specify authentication methods for LAN users.

     authentication lan-access { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**ldap-scheme** *ldap-scheme-name* | **radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authentication methods are used for LAN users.
   - Specify authentication methods for login users.

     authentication login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **local** [**ldap-scheme** *ldap-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default authentication methods are used for login users.
   - Specify authentication methods for portal users.

     authentication portal { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**ldap-scheme** *ldap-scheme-name* | **radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authentication methods are used for portal users.
   - Specify authentication methods for obtaining a temporary user role.

     authentication super { **hwtacacs-scheme** *hwtacacs-scheme-name* | **radius-scheme** *radius-scheme-name* } *

     By default, the default authentication methods are used for obtaining a temporary user role.

Configuring authorization methods for an ISP domain

Restrictions and guidelines

For high availability, you can specify one primary authorization method and multiple backup authorization methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local none** parameters specify a primary RADIUS authorization method and two backup methods (local authorization and no authorization). The device performs RADIUS authorization by default and performs local authorization when the RADIUS server is invalid. The device does not perform authorization when both of the previous methods are invalid.

The remote authorization method is invalid in the following situations:

- The specified authorization scheme does not exist.
- The device fails to send authorization request packets.
- The device does not receive any authorization response packets from an authorization server.

The local authorization method is invalid if the device fails to find the matching local user configuration.

To use a RADIUS scheme as the authorization method, specify the name of the RADIUS scheme that is configured as the authentication method for the ISP domain. If an invalid RADIUS scheme is specified as the authorization method, RADIUS authentication and authorization fail.

The **none** keyword is not supported in FIPS mode.

When the primary authorization method is local, the following rules apply:

- The device uses the backup authorization methods in sequence only if local authorization is invalid for one of the following reasons:
  - An exception occurs in the local authorization process.
  - The device connection is terminated or the user account is not configured on the device
- The device does not turn to the backup authorization methods if local authorization is invalid because of any other reason. Authorization fails for the user.

Prerequisites

Before configuring authorization methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authorization scheme for each access type and service type.
2. Determine whether to configure the default authorization method for all access types or service types. The default authorization method applies to all access users. However, the method has a lower priority than the authorization method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authorization methods for all types of users.

   authorization default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the authorization method is **local**.

4. Specify authorization methods for a user type or a service.
   - Specify command authorization methods.

     authorization command { **hwtacacs-scheme** *hwtacacs-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** }

     By default, the default authorization methods are used for command authorization.
   - Specify authorization methods for LAN users.

     authorization lan-access { **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authorization methods are used for LAN users.
   - Specify authorization methods for login users.

     authorization login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default authorization methods are used for login users.
   - Specify authorization methods for portal users.

     authorization portal { **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authorization methods are used for portal users.

Configuring accounting methods for an ISP domain

Restrictions and guidelines

For high availability, you can specify one primary accounting method and multiple backup accounting methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local none** parameters specify a primary RADIUS accounting method and two backup methods (local accounting and no accounting). The device performs RADIUS accounting by default and performs local accounting when the RADIUS server is invalid. The device does not perform accounting when both of the previous methods are invalid.

The remote accounting method is invalid in the following situations:

- The specified accounting scheme does not exist.
- The device fails to send accounting request packets.
- The device does not receive any accounting response packets from an accounting server.

The local accounting method is invalid if the device fails to find the matching local user configuration.

FTP, SFTP, and SCP users do not support accounting.

Local accounting does not provide statistics for charging. It only counts and controls the number of concurrent users that use the same local user account. The threshold is configured by using the **access-limit** command.

The **none** keyword is not supported in FIPS mode.

When the primary accounting method is local, the following rules apply:

- The device uses the backup accounting methods in sequence only if local accounting is invalid for one of the following reasons:
  - An exception occurs in the local accounting process.

- The device connection is terminated or the user account is not configured on the device

- The device does not turn to the backup accounting methods if local accounting is invalid because of any other reason. Accounting fails for the user.

Prerequisites

Before configuring accounting methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an accounting method for each access type and service type.
2. Determine whether to configure the default accounting method for all access types or service types. The default accounting method applies to all access users. However, the method has a lower priority than the accounting method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default accounting methods for all types of users.

   accounting default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the accounting method is **local**.

4. Specify accounting methods for a user type.
   - Specify the command accounting method.

     accounting command hwtacacs-scheme *hwtacacs-scheme-name*

     By default, the default accounting methods are used for command accounting.
   - Specify accounting methods for LAN users.

     accounting lan-access { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default accounting methods are used for LAN users.
   - Specify accounting methods for login users.

     accounting login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default accounting methods are used for login users.
   - Specify accounting methods for portal users.

     accounting portal { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default accounting methods are used for portal users.
5. (Optional.) Configure extended accounting policies.

- Configure access control for users that encounter accounting-start failures.
  accounting start-fail { **offline** | **online** }
  By default, the device allows users that encounter accounting-start failures to stay online.
- Configure access control for users that have failed all their accounting-update attempts.
  accounting update-fail { [**max-times** *max-times*] **offline** | **online** }
  By default, the device allows users that have failed all their accounting-update attempts to stay online.
- Configure access control for users that have used up their data or time accounting quotas.
  accounting quota-out { **offline** | **online** }
  By default, the device logs off users that have used up their accounting quotas.
- Specify the accounting method for dual-stack users.
  accounting dual-stack { **merge** | **separate** }
  By default, the merge method is used.

Display and maintenance commands for ISP domains

Execute **display** commands in any view.

Task	Command
Display configuration information about an ISP domain or all ISP domains.	**display domain** [*isp-name*]

Configuring AAA fail-permit and recovery

About this task

This feature is used to resolve the issue that users cannot come online when all RADIUS servers are unavailable. The feature contains the following settings in a user authentication domain:

- In the user authentication domain, specify a critical domain (also known as fail-permit domain) to accommodate users that access the authentication domain when all RADIUS servers are unavailable. The users can come online in the critical domain without being authenticated when all RADIUS servers are unavailable.
- In the user authentication domain, specify an action to take on users that have been assigned to the critical domain when a RADIUS server becomes available.
  - To perform authentication, authorization, and accounting for the users, log off the users.
  - To allow the users to stay online without being authenticated, specify a recovery domain. When a RADIUS server becomes available, the users in the critical domain are assigned to the recovery domain.
  - To reauthenticate users in the original authentication domain without users being aware of the process, specify the reauthentication action.

For the device to obtain the status of RADIUS authentication servers in time, it detects the status of the RADIUS authentication servers in each RADIUS scheme at intervals. In addition, the device notifies access modules to remove users that use a RADIUS scheme from the critical domain when that RADIUS scheme has reachable RADIUS servers.

Restrictions and guidelines

This feature takes effect only on the 802.1X authentication, Web authentication, and MAC authentication for wired users.

When you specify a critical domain for an ISP domain, follow these restrictions and guidelines:

- If non-none authentication, authorization, or accounting methods are configured in the critical domain for an ISP domain, the non-none authentication or authorization methods cannot take effect on users. However, the non-none accounting methods in the critical domain can take effect on users.
- If an ISP domain has been specified as a critical domain, do not specify a critical domain for that ISP domain. If you do so, the critical domain specified for that ISP domain cannot take effect.
- If a critical domain has been specified for an ISP domain, do not specify that ISP domain as a critical domain. If you do so, that ISP domain cannot act as a critical domain.

When you specify a recovery domain for an ISP domain, follow these restrictions and guidelines:

- If the **none** method is configured as the backup authentication method in the original authentication domain before the users are assigned to the critical domain, the users are still assigned to the recovery domain when a RADIUS server becomes available.
- As a best practice to accurately identify whether a RADIUS authentication server is available and the recovery configuration can take effect in time, configure RADIUS server status detection.
- In the current software version, you can specify only an ISP domain as its own recovery domain in the view of the ISP domain.

When you set the interval at which the device detects the status of RADIUS authentication servers, follow these restrictions and guidelines:

- A too short interval consumes too many system resources for access services. A too long interval cannot detect server status changes in time.
- As a best practice, consider the processing efficiency for access services and the accuracy for fail-permit and recovery when a large number of users come online in a short time.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Set the interval at which the device detects the status of RADIUS authentication servers.

   radius-server authen-state-check interval *interval*

   By default, the device detects the status of RADIUS authentication servers at intervals of 10 minutes.

3. Enter ISP domain view.

   domain *isp-name*

4. Specify a critical domain to accommodate users that access the ISP domain when all RADIUS servers are unavailable.

   authen-radius-unavailable online domain *new-isp-name*

   By default, no critical domain is specified for an ISP domain to accommodate users that access the ISP domain when all RADIUS servers are unavailable.

5. Specify an action to take on users in the critical domain when a RADIUS server becomes available.

   authen-radius-recover { **offline** | **online domain** *new-isp-name* | **re-authen** }

   By default, no action is specified for users in the critical domain when a RADIUS server becomes available.

Setting the maximum number of concurrent login users

About this task

Perform this task to set the maximum number of concurrent users that can log on to the device through a specific protocol, regardless of their authentication methods. The authentication methods include no authentication, local authentication, and remote authentication.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of concurrent login users.
   In non-FIPS mode:
   aaa session-limit { **ftp** | **http** | **https** | **ssh** | **telnet** } *max-sessions*
   In FIPS mode:
   aaa session-limit { **https** | **ssh** } *max-sessions*
   By default, the maximum number of concurrent login users is 32 for each user type.

Configuring a NAS-ID

About this task

During RADIUS authentication, the device uses a NAS-ID to set the NAS-Identifier attribute of RADIUS packets so that the RADIUS server can identify the access location of users.

Configure a NAS-ID profile to maintain NAS-ID and VLAN bindings on the device so that the device can send different NAS-Identifier attribute strings in RADIUS requests from different VLANs.

Restrictions and guidelines

You can apply a NAS-ID profile to portal- or port security-enabled interfaces. For more information, see "Configuring portal authentication" and "Configuring port security."

You can configure multiple NAS-ID and VLAN bindings in a NAS-ID profile.

A NAS-ID can be bound with more than one VLAN, but a VLAN can be bound with only one NAS-ID. If you configure multiple bindings for the same VLAN, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Create a NAS-ID profile and enter NAS-ID profile view.
   aaa nas-id profile *profile-name*
3. Configure a NAS-ID and VLAN binding in the profile.
   nas-id *nas-identifier* **bind vlan** *vlan-id*

Configuring the device ID

About this task

RADIUS uses the value of the Acct-Session-ID attribute as the accounting ID for a user. The device generates an Acct-Session-ID value for each online user based on the system time, random digits, and device ID.

Procedure

1. Enter system view.
   `system-view`
2. Configure the device ID.
   `aaa device-id` *`device-id`*
   By default, the device ID is 0.

Enabling password change prompt logging

About this task

Use this feature to enhance the protection of passwords for Telnet, SSH, HTTP, HTTPS, NETCONF over SSH, and NETCONF over SOAP users and improve the system security.

This feature enables the device to generate logs to prompt users to change their weak passwords at an interval of 24 hours and at the users' login.

A password is a weak password if it does not meet the following requirements:

- Password composition restriction configured by using the **`password-control composition`** command.
- Minimum password length restriction set by using the **`password-control length`** command.
- Password complexity checking policy configured by using the **`password-control complexity`** command.

For a NETCONF over SSH or NETCONF over SOAP user, the device also generates a password change prompt log if any of the following conditions exists:

- The current password of the user is the default password or has expired.
- The user logs in to the device for the first time or uses a new password to log in after global password control is enabled.

The device will no longer generate password change prompt logs for a user when one of the following conditions exists:

- The password change prompt logging feature is disabled.
- The user has changed the password and the new password meets the password control requirements.
- The enabling status of a related password control feature has changed so the current password of the user meets the password control requirements.
- The password composition policy or the minimum password length has changed.

Restrictions and guidelines

You can use the **`display password-control`** command to display password control configuration. For more information about password control commands, see password control commands in *Security Command Reference*.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enable password change prompt logging.
   ```
   local-server log change-password-prompt
   ```
   By default, password change prompt logging is enabled.

Configuring the RADIUS server feature

RADIUS server feature tasks at a glance

To configure the RADIUS server feature, perform the following tasks:

1. Configuring RADIUS users
2. Specifying RADIUS clients
3. Specifying a RADIUS TLS client
4. Activating the RADIUS server configuration
5. Configure rate limit for the local RADIUS server to process packets
6. Enabling authentication logging for the local RADIUS server
7. Configuring the RADIUS server to support EAP authentication
8. Configuring the RADIUS server to include attribute Message-Authenticator numbered in responses

Restrictions and guidelines for the RADIUS server feature

To ensure correct operation of the RADIUS server feature, disable RADIUS session-control on the device.

Configuring RADIUS users

To configure RADIUS users, you must configure network access users, which are the basis of RADIUS user data.

A RADIUS user has the following attributes: user name, password, description, authorization ACL, authorization VLAN, and expiration time. For more information, see "Configuring attributes for network access users."

Specifying RADIUS clients

About this task

Perform this task to specify RADIUS clients and shared keys for centralized management. The RADIUS server feature does not accept requests from RADIUS clients that are not managed by the system.

Restrictions and guidelines

The IP address of a RADIUS client must be the same as the source IP address for outgoing RADIUS packets specified on the RADIUS client.

The shared key of a RADIUS client specified on the RADIUS server must be the same as the setting on the RADIUS client.

Procedure

1. Enter system view.
   system-view
2. Specify a RADIUS client.
   radius-server client ip *ipv4-address* **key** { **cipher** | **simple** } *string* [**force-message-authenticator**]

Specifying a RADIUS TLS client

About this task

This configuration specifies the IP address of the RADIUS TLS client to manage and the shared key for communication with the RADIUS TLS client.

Feature and software version compatibility

Only the R8337 and later versions support this feature.

Restrictions and guidelines

The IP address of the RADIUS TLS client specified on the RADIUS server must match the source IP address configured on the RADIUS TLS client for sending RADIUS packets.

The shared key specified on the RADIUS server must match the shared key configured for the RADIUS TLS client for communication with the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Specify a RADIUS TLS client.
   radius-server tls-client ip *ipv4-address* **key** { **cipher** | **simple** } *string* [**force-message-authenticator**] **ssl-server-policy** *string*

   By default, no RADIUS TLS client is specified.
3. Configure the idle timeout for RADIUS over TLS client connections.
   radius-server tls-idle-timeout *timeout-value*

   By default, the idle timeout for RADIUS over TLS client connections is 60 seconds.
4. Configure the maximum number of connections for each RADIUS over TLS client.
   radius-server tls-max-connections *max-value*

   By default, a RADIUS over TLS client supports a maximum of 16 connections.

Activating the RADIUS server configuration

About this task

At the device startup, the RADIUS server configuration is automatically activated, including RADIUS users and RADIUS clients. You can immediately activate the most recent RADIUS server configuration if you have added, modified, or deleted RADIUS clients and network access users from which RADIUS user data is generated.

Procedure

1. Enter system view.
   system-view
2. Activate the RADIUS server configuration.

radius-server activate

Executing this command restarts the RADIUS server process and an authentication service interruption will occur during the restart.

Configure rate limit for the local RADIUS server to process packets

About this task

Use this function to limit the packet processing rate for data packets that the local RADIUS server receives. This helps prevent RADIUS server overload. With this feature configured, the RADIUS server counts the total number of packets it receives per second. If this total exceeds the **request-rate** value you set, the server discards any new packets that exceed the limit. This ensures stable server operation.

Restrictions and guidelines

As a best practice, do not set the limit value too low. For example, avoid setting it below 100. A low value may cause the system to mistake legitimate traffic for an overload, which can affect service availability.

Procedure

1. Enter system view.

   system-view
2. Configure rate limit for the local RADIUS server to process packets.

   radius-server request-rate-limit *request-rate*

   By default, the local RADIUS server processes packets without rate limiting.

Enabling authentication logging for the local RADIUS server

About this task

With this feature enabled, administrators can view the authentication status of users that come online from this server.

Procedure

1. Enter system view.

   system-view
2. Enable authentication logging for the local RADIUS server.

   radius-server auth-log enable

   By default, authentication logging is disabled for the local RADIUS server.

Configuring the RADIUS server to support EAP authentication

About this task

Use this feature to specify the EAP authentication profile when the device acts as a RADIUS server. After the local RADIUS server starts, the device uses the EAP authentication method and related parameters from the specified EAP authentication profile to interact with the peer.

Currently, the local RADIUS server supports the following EAP authentication methods: MD5-Challenge, PEAP-GTC, PEAP-MSCHAPV2, TLS, TTLS-GTC, and TTLS-MSCHAPV2.

Restrictions and guidelines

The system supports a maximum of 16 EAP authentication profiles.

The device supports multiple EAP authentication methods. When initiating an access request to a peer, the device first uses the default EAP authentication method configured in the EAP authentication profile. If the peer uses an EAP authentication method different from the default, it notifies the local device of the EAP methods it supports. The device then uses a locally supported EAP method that matches the peer's and resends an access request to the peer.

Prerequisites

Before you configure a local certificate, its private key, or a CA certificate, import the corresponding files to the device's root directory on the storage media through FTP or TFTP. In an IRF network, make sure both the master and subordinate devices have the corresponding files saved in the root directory of their storage media.

Procedure

1. Enter system view.

   system-view

2. Create an EAP authentication profile and enter its view.

   eap-profile *eap-profile-name*

3. Configure the default EAP authentication method.

   method { **md5** | **peap-gtc** | **peap-mschapv2** | **tls** | **ttls-gtc** | **ttls-mschapv2** }

   By default, the EAP authentication method is MD5-Challenge.

   You can specify only one EAP authentication method for an EAP authentication profile. If you configure multiple methods for a profile, the most recent configuration takes effect.

4. Configure the local certificate and private key for EAP authentication.

   a. Configure a local certificate.

      certificate-file *file-name*

      By default, no local certificate is configured for EAP authentication.

      When a client uses PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, TTLS-MSCHAPv2, or TLS as the EAP authentication method and chooses to verify the server certificate, you must provide a local certificate for the client to verify.

   b. Configure the private key for the local certificate.

      private-key-file *file-name*

      By default, the private key used by the local certificate is not configured for EAP authentication.

      If the local certificate contains a private key, the private key file you specify here must have the same file name as the local certificate file.

   c. Configure the private key password for the local certificate.

      private-key-password { **cipher** | **simple** } *string*

      By default, the private key password is not configured for a local certificate.

      The device requires the corresponding private key password when you import and use the private key of a local certificate. The private key password you configure with this command must match the password you specified when you exported the private key.

5. Configure the CA certificate for EAP authentication.

   ca-file *file-name*

   By default, no CA certificate is specified for EAP authentication.

   When the client uses PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, or TTLS-MSCHAPv2 as the EAP authentication method, the device uses a CA certificate to validate the client's certificate.

6. Return to system view.
   quit
7. Specify the EAP authentication profile for the local RADIUS server.
   radius-server eap-profile *eap-profile-name*
   By default, no EAP authentication profile is applied for a local RADIUS server.

Configuring the RADIUS server to include attribute Message-Authenticator numbered in responses

About this task

If RADIUS clients require RADIUS responses to carry attribute Message-Authenticator numbered 80, you must perform this task to configure RADIUS server to include the attribute in responses. If you do not do so, RADIUS clients might drop the RADIUS responses.

Procedure

1. Enter system view.
   system-view
2. Configure the RADIUS server to include attribute Message-Authenticator numbered in responses.
   radius-server client ip *ipv4-address* **key** { **cipher** | **simple** } *string* [**force-message-authenticator**]
   By default, RADIUS server does not include attribute Message-Authenticator in responses.
3. Configure the RADIUS server to include attribute Message-Authenticator numbered 80 in responses.
   radius-server message-authenticator force-reply
   By default, RADIUS server does not include attribute Message-Authenticator in responses.

Display and maintenance commands for RADIUS users and clients

Execute **display** commands in any view.

NOTE:
Only the R8337 and later versions support the **active-tls-client** keyword.

Task	Command
Display information about activated RADIUS users.	**display radius-server** { **active-client** | **active-tls-client** }
Display information about the activated EAP profile.	**display radius-server active-eap-profile**
Display information about activated RADIUS clients.	**display radius-server active-client**

Configuring user online and offline recording

About user online and offline recording

This feature enables the device to record user information when the users fail to come online, or the users go offline normally or abnormally. These records help the administrator to quickly identify the causes of user online and offline faults. The feature occupies the system memory. To reduce the memory usage, you can disable this feature.

Restrictions and guidelines: User online and offline recording

This feature is applicable only to Telnet, SSH, FTP, HTTP, and HTTPS users.

Enabling user online failure recording

1. Enter system view.
   system-view
2. Enable user online failure recording.
   aaa online-fail-record enable
   By default, user online failure recording is disabled.

Enabling user offline recording

1. Enter system view.
   system-view
2. Enable user offline recording.
   aaa offline-record enable
   By default, user offline recording is disabled.
   User normal offline recording and user abnormal offline recording take effect only when this feature is enabled.
3. Enable user normal offline recording.
   aaa normal-offline-record enable
   By default, user normal offline recording is disabled.
4. Enable user abnormal offline recording.
   aaa abnormal-offline-record enable
   By default, user abnormal offline recording is disabled.

Enabling real-time backup for user online and offline records

1. Enter system view.
   system-view
2. Enable real-time backup for user online and offline records.
   aaa { **abnormal-offline-record** | **normal-offline-record** | **online-fail-record** } * **realtime-backup enable**
   By default, real-time backup for user online and offline records is enabled.

Verifying and maintaining user online and offline records

Displaying user online failure records

To display user online failure records, execute the following command in any view:

display aaa online-fail-record { **access-type** { **lan-access** | **login** } **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*]

display aaa online-fail-record time *begin-time end-time* [**date** *begin-date end-date*] [**brief**]

display aaa online-fail-record

Displaying user normal offline records

To display user normal offline records, execute the following command in any view:

display aaa normal-offline-record { **access-type** { **lan-access** | **login** } **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*]

display aaa normal-offline-record time *begin-time end-time* [**date** *begin-date end-date*] [**brief**]

display aaa normal-offline-record

Displaying user abnormal offline records

To display user abnormal offline records, execute the following command in any view:

display aaa abnormal-offline-record { **access-type** { **lan-access** | **login** } **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** ipv4-address | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*]

display aaa abnormal-offline-record offline-reason { **idle-cut** | **quota-out** | **realtime-acct-fail** | **session-timeout** | **user-detect-fail** } [**brief**]

display aaa abnormal-offline-record time *begin-time end-time* [**date** *begin-date end-date*] [**brief**]

display aaa abnormal-offline-record

Displaying user offline records

To display user offline records, execute the following command in any view:

display aaa offline-record { **access-type** { **lan-access** | **login** } **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*]

display aaa offline-record time *begin-time end-time* [**date** *begin-date end-date*] [**brief**]

display aaa offline-record

Clearing user online and offline records

Perform clear tasks in user view.

- Clear user online failure records.
  reset aaa online-fail-record
- Clear user normal offline records.
  reset aaa normal-offline-record
- Clear user abnormal offline records.
  reset aaa abnormal-offline-record
- Clear user offline records.
  reset aaa offline-record

Configuring the connection recording policy

About the connection recording policy

Use this feature on scenarios where the device acts as an FTP, SSH, SFTP, or Telnet login client to establish a connection with a login server. This feature enables the device to provide an accounting server with the connection start and termination information. When the login client establishes a connection with the login server, the system sends a start-accounting request to the accounting server. When the connection is terminated, the system sends a stop-accounting request to the accounting server.

Restrictions and guidelines

The device includes the username entered by a user in the accounting packets to be sent to the AAA server for connection recording. The username format configured by using the **user-name-format** command in the accounting scheme does not take effect.

Procedure

1. Enter system view.
   system-view
2. Create a connection recording policy and enter its view.
   aaa connection-recording policy
3. Specify the accounting method for the connection recording policy.
   accounting hwtacacs-scheme *hwtacacs-scheme-name*

Display and maintenance commands for the connection recording policy

Execute **display** commands in any view.

Task	Command
Display the connection recording policy configuration.	**display aaa connection-recording policy**

Configuring the AAA test feature

About this task

This feature enables the device to send authentication or accounting requests to the specified AAA servers to simulate an authentication or accounting process of a user. Use this feature to identify the reasons for the failure of the interaction between the device and the AAA servers. This feature is applicable only to RADIUS.

When performing an AAA test, the device ignores the status of the specified AAA servers and the RADIUS server load sharing feature. The process of an AAA test is as follows:

1. The device sends authentication requests that carry the specified username and password to the specified authentication server or to the authentication servers in the specified RADIUS scheme. The device tries to communicate with the authentication servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives an authentication response (no matter the authentication succeeds or fails).
   - The device does not receive any authentication response after making all authentication request attempts.

   This step is skipped if no correct authentication server is specified for the AAA test or no authentication servers are configured in the specified RADIUS scheme.
2. The device sends start-accounting requests to the specified accounting server or to the accounting servers in the specified RADIUS scheme. The device tries to communicate with the accounting servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives a start-accounting response (no matter the accounting succeeds or fails).
   - The device does not receive any start-accounting response after making all start-accounting request attempts.

   This step and the next step are skipped if no correct accounting server is specified for the AAA test or no accounting servers are configured in the specified RADIUS scheme.
3. The device sends stop-accounting requests to the accounting servers to which it has sent a start-accounting request.

   The process finishes in the following situations:

   - The device receives a stop-accounting response.
   - The device does not receive any stop-accounting response after making all stop-accounting request attempts.

To identify attributes that cause authentication or accounting failures, you can configure the device to carry specific attributes in RADIUS requests or define values for specific attributes in the requests. Table 4 shows the attributes that RADIUS requests carry by default.

Table 4 Attributes that RADIUS requests carry by default

Packet type	Attributes that the type of packets carry by default
RADIUS authentication request	User-Name

Packet type	Attributes that the type of packets carry by default
	CHAP-Password (or User-Password) CHAP-Challenge NAS-IP-Address (or NAS-IPv6-Address) Service-Type Framed-Protocol NAS-Identifier NAS-Port-Type Acct-Session-Id
RADIUS accounting request	User-Name Acct-Status-Type NAS-IP-Address (or NAS-IPv6-Address) NAS-Identifier Acct-Session-Id Acct-Delay-Time Acct-Terminate-Cause

Restrictions and guidelines

When you perform an AAA test, follow these restrictions and guidelines:

- The device might communicate with the AAA servers incorrectly during an AAA test. Make sure no users come online or go offline during an AAA text.
- If the configuration of the specified RADIUS scheme changes, the new configuration does not affect the current AAA test. The modification will take effect in the next test.
- The system can have only one AAA test at a time. Another AAA test can be performed only after the current test finishes.

When you configure attributes to be included in or excluded from RADIUS requests, follow these restrictions and guidelines:

- Before you include an attribute that is already configured to be excluded from RADIUS requests, you must cancel the exclusion configuration by using the **undo exclude** command.
- Before you exclude an attribute that is already configured to be included in RADIUS requests, you must cancel the inclusion configuration by using the **undo include** command.

Prerequisites

Before you perform an AAA test, you must configure a RADIUS scheme that contains the RADIUS servers to be tested.

Plan the RADIUS attributes to be included in RADIUS requests. Besides the attributes carried by default, the device adds the specified attributes to RADIUS packets in the order that they are specified by using the **include** command. Additional attributes cannot be added to a RADIUS request if the length of the RADIUS request reaches 4096 bytes.

Procedure

1. (Optional.) Configure a RADIUS attribute test group:
   a. Enter system view.
      system-view
   b. Create a RADIUS attribute test group and enter its view.
      radius attribute-test-group *attr-test-group-name*
      You can create multiple RADIUS attribute test groups.

c. Include an attribute in RADIUS requests.

include { **accounting** | **authentication** } { **name** *attribute-name* | [**vendor** *vendor-id*] **code** *attribute-code* } **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** } value *attribute-value*

Use this command to add attributes that RADIUS requests do not carry by default to the RADIUS requests.

For an attribute that RADIUS requests carry by default, you can use this command to change its attribute value.

d. Exclude an attribute from RADIUS requests.

exclude { **accounting** | **authentication** } **name** *attribute-name*

Use this command to exclude an attribute that RADIUS requests carry by default from the RADIUS requests sent during an AAA test to help troubleshoot authentication or accounting failures.

e. Return to system view.

quit

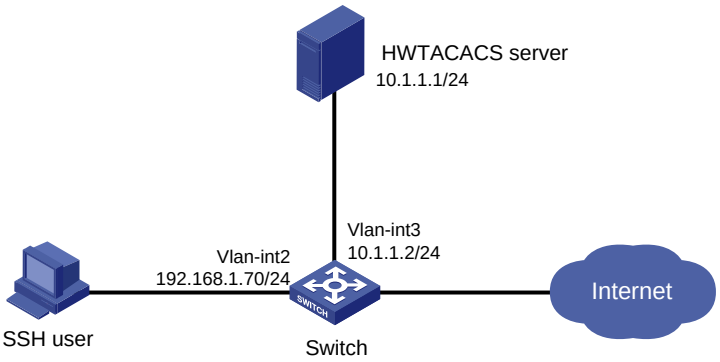
f. Return to user view.

quit

2. Perform an AAA test in user view.

test-aaa user *user-name* **password** *password* **radius-scheme** *radius-scheme-name* [**radius-server** { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*]] [**chap** | **pap**] [**attribute-test-group** attr-*test-group-name*] [**trace**]

AAA configuration examples



Example: Configuring AAA for SSH users by an HWTACACS server

Network configuration

As shown in Figure 14, configure the switch to meet the following requirements:

- Use the HWTACACS server for SSH user authentication, authorization, and accounting.
- Assign the default user role **network-operator** to SSH users after they pass authentication.
- Exclude domain names from the usernames sent to the HWTACACS server.
- Use **expert** as the shared keys for secure HWTACACS communication.

Figure 14 Network diagram

Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for the interfaces. (Details not shown.)

Create an HWTACACS scheme.

```
<Switch> system-view
[Switch] hwtacacs scheme hwtac
```

Specify the primary authentication server.

```
[Switch-hwtacacs-hwtac] primary authentication 10.1.1.1 49
```

Specify the primary authorization server.

```
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.1 49
```

Specify the primary accounting server.

```
[Switch-hwtacacs-hwtac] primary accounting 10.1.1.1 49
```

Set the shared keys to **expert** in plaintext form for secure HWTACACS communication.

```
[Switch-hwtacacs-hwtac] key authentication simple expert
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] key accounting simple expert
```

Exclude domain names from the usernames sent to the HWTACACS server.

```
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Create an ISP domain named **bbb** and configure the domain to use the HWTACACS scheme for authentication, authorization, and accounting of login users.

```
[Switch-isp-bbb] authentication login hwtacacs-scheme hwtac
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login hwtacacs-scheme hwtac
[Switch-isp-bbb] quit
```

Create local RSA and DSA key pairs.

```
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

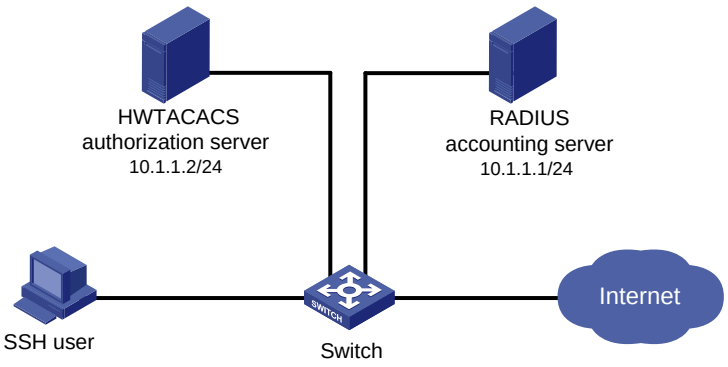
```
[Switch] role default-role enable
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter the correct username and password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring local authentication, HWTACACS authorization, and RADIUS accounting for SSH users



Network configuration

As shown in Figure 15, configure the switch to meet the following requirements:

- Perform local authentication for SSH users.
- Use the HWTACACS server and RADIUS server for SSH user authorization and accounting, respectively.
- Exclude domain names from the usernames sent to the servers.
- Assign the default user role **network-operator** to SSH users after they pass authentication.

Configure an account named **hello** for the SSH user. Configure the shared keys to **expert** for secure communication with the HWTACACS server and RADIUS server.

Figure 15 Network diagram

Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the RADIUS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an HWTACACS scheme.

```
[Switch] hwtacacs scheme hwtac
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.2 49
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Configure a RADIUS scheme.

```
[Switch] radius scheme rd
[Switch-radius-rd] primary accounting 10.1.1.1 1813
[Switch-radius-rd] key accounting simple expert
[Switch-radius-rd] user-name-format without-domain
[Switch-radius-rd] quit
```

Create a device management user.

```
[Switch] local-user hello class manage
```

Assign the SSH service to the local user.

```
[Switch-luser-manage-hello] service-type ssh
```

Set the password to **123456TESTplat&!** in plaintext form for the local user. In FIPS mode, you must set the password in interactive mode.

```
[Switch-luser-manage-hello] password simple 123456TESTplat&!
[Switch-luser-manage-hello] quit
```

Create an ISP domain named **bbb** and configure the login users to use local authentication, HWTACACS authorization, and RADIUS accounting.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login local
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login radius-scheme rd
[Switch-isp-bbb] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

```
[Switch] role default-role enable
```

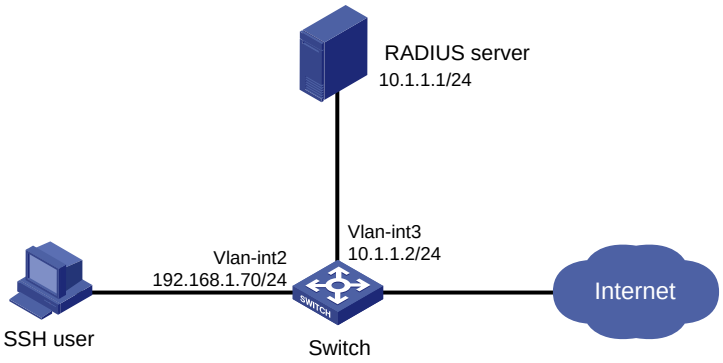
Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring authentication and authorization for SSH users by a RADIUS server

Network configuration



As shown in Figure 16, configure the switch to meet the following requirements:

- Use the RADIUS server for SSH user authentication and authorization.
- Include domain names in the usernames sent to the RADIUS server.
- Assign the **network-admin** user role to SSH users after they pass authentication.

The RADIUS server runs IMC PLAT 7.3 (E0605) and IMC UAM 7.3 (E0512). Add an account with username **hello@bbb** on the RADIUS server.

The RADIUS server and the switch use **expert** as the shared key for secure RADIUS communication. The ports for authentication and accounting are **1812** and **1813**, respectively.

Figure 16 Network diagram

Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

   Log in to IMC, click the **User** tab, and select **User Access Policy** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the ports for authentication and accounting to 1812 and 1813, respectively.
   b. Select **Device Management Service** from the **Service Type** list.
   c. Select **H3C (General)** from the **Access Device Type** list.
   d. Set the shared key to **expert** for secure RADIUS communication.
   e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.
   f. Use the default values for other parameters and click **OK**.

   The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

   - IP address specified by using the **`nas-ip`** command.
   - IP address specified by using the **`radius nas-ip`** command.
   - IP address of the outbound interface (the default).

Figure 17 Adding the switch as an access device

2. Add an account for device management:

   Click the **User** tab, and select **Device User** > **Device User** from the navigation tree. Then, click **Add** to configure a device management account as follows:

   a. Enter account name **hello@bbb** and specify the password.

   b. Select **SSH** from the **Login Type** list.

   c. Enter user role **network-admin**.

   d. Specify 10.1.1.0 to 10.1.1.255 as the IP address range of the hosts to be managed.

   e. Click **OK**.

NOTE:

The IP address range must contain the IP address of the switch.

Figure 18 Adding an account for device management

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Create a RADIUS scheme.

```
[Switch] radius scheme rad
```

Specify the primary authentication server.

```
[Switch-radius-rad] primary authentication 10.1.1.1 1812
```

Set the shared key to **expert** in plaintext form for secure communication with the server.

```
[Switch-radius-rad] key authentication simple expert
```

Include domain names in the usernames sent to the RADIUS server.

```
[Switch-radius-rad] user-name-format with-domain
[Switch-radius-rad] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login radius-scheme rad
[Switch-isp-bbb] authorization login radius-scheme rad
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

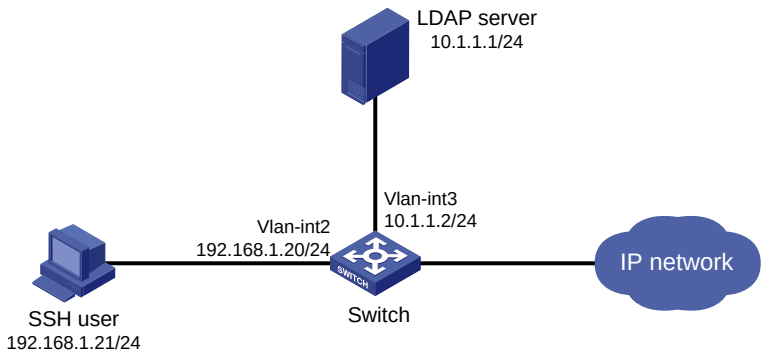
Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-admin user role. (Details not shown.)

Example: Configuring authentication for SSH users by an LDAP server

Network configuration



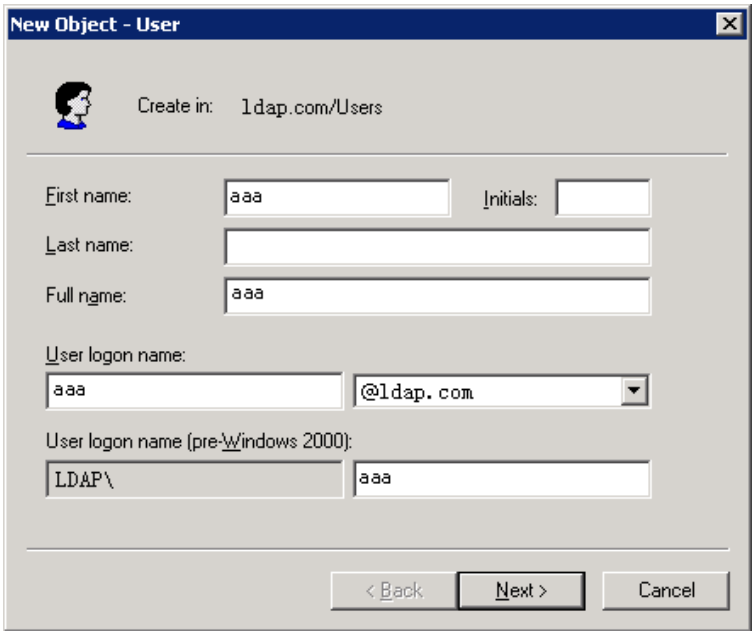
As shown in Figure 19, the LDAP server uses domain **ldap.com** and runs Microsoft Windows 2003 Server Active Directory.

Configure the switch to meet the following requirements:

- Use the LDAP server to authenticate SSH users.
- Assign the level-0 user role to SSH users after they pass authentication.

On the LDAP server, set the administrator password to **admin!123456**, add a user named **aaa**, and set the user's password to **ldap!123456**.

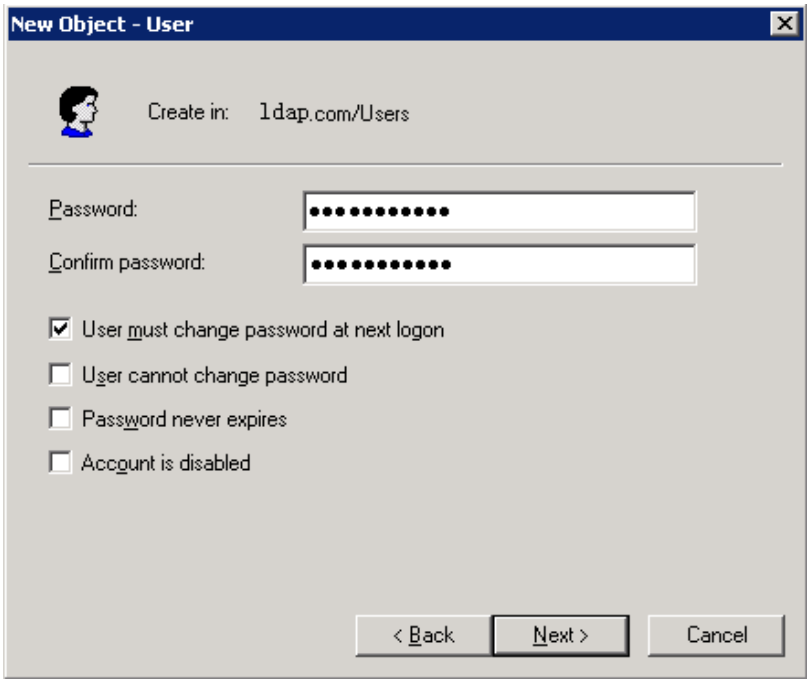
Figure 19 Network diagram



Configuring the LDAP server

1. Add a user named **aaa** and set the password to **ldap!123456**:
   a. On the LDAP server, select **Start** > **Control Panel** > **Administrative Tools**.
   b. Double-click **Active Directory Users and Computers**.
      The **Active Directory Users and Computers** window is displayed.
   c. From the navigation tree, click **Users** under the **ldap.com** node.

d. Select **Action** > **New** > **User** from the menu to display the dialog box for adding a user.



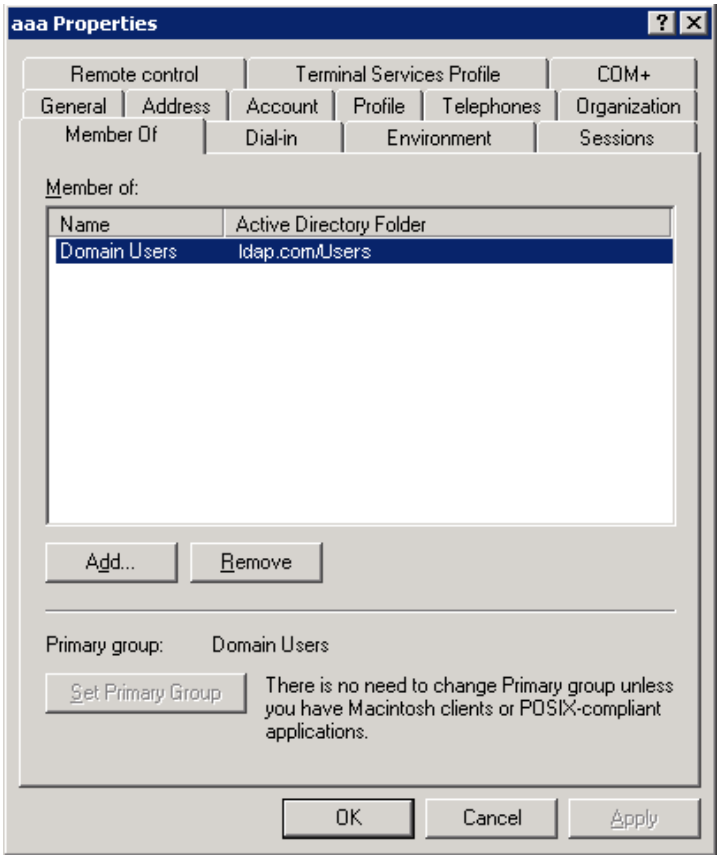
e. Enter logon name **aaa** and click **Next**.

Figure 20 Adding user aaa

f. In the dialog box, enter password **ldap!123456**, select options as needed, and click **Next**.

Figure 21 Setting the user's password

g. Click **OK**.



2. Add user **aaa** to group **Users**:

a. From the navigation tree, click **Users** under the **ldap.com** node.

b. In the right pane, right-click user **aaa** and select **Properties**.

c. In the dialog box, click the **Member Of** tab and click **Add**.

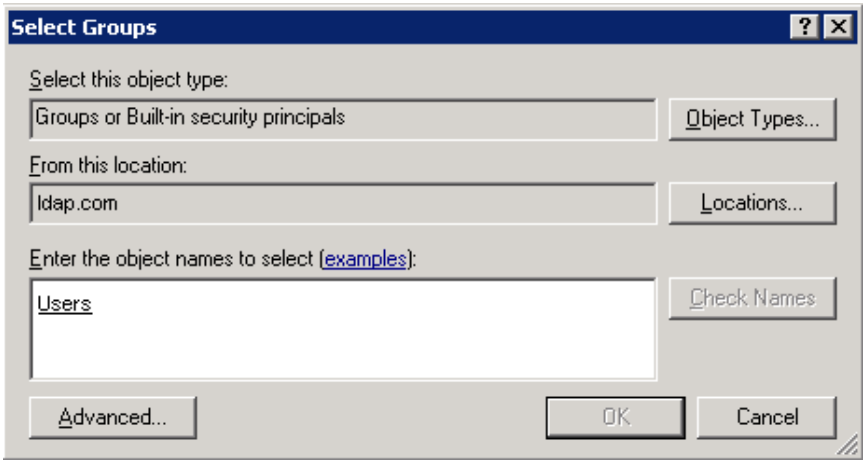


Figure 22 Modifying user properties

d. In the **Select Groups** dialog box, enter **Users** in the **Enter the object names to select** field, and click **OK**.

User **aaa** is added to group **Users**.

Figure 23 Adding user aaa to group Users

3. Set the administrator password to **admin!123456**:

a. In the right pane, right-click user **Administrator** and select **Set Password**.

b. In the dialog box, enter the administrator password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an LDAP server.

```
[Switch] ldap server ldap1
```

Specify the IP address of the LDAP authentication server.

```
[Switch-ldap-server-ldap1] ip 10.1.1.1
```

Specify the administrator DN.

```
[Switch-ldap-server-ldap1] login-dn cn=administrator,cn=users,dc=ldap,dc=com
```

Specify the administrator password.

```
[Switch-ldap-server-ldap1] login-password simple admin!123456
```

Configure the base DN for user search.

```
[Switch-ldap-server-ldap1] search-base-dn dc=ldap,dc=com
[Switch-ldap-server-ldap1] quit
```

Create an LDAP scheme.

```
[Switch] ldap scheme ldap-shm1
```

Specify the LDAP authentication server.

```
[Switch-ldap-ldap-shm1] authentication-server ldap1
[Switch-ldap-ldap-shm1] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login ldap-scheme ldap-shm1
[Switch-isp-bbb] authorization login none
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter username **aaa@bbb** and password **ldap!123456**. The user logs in to the switch. (Details not shown.)

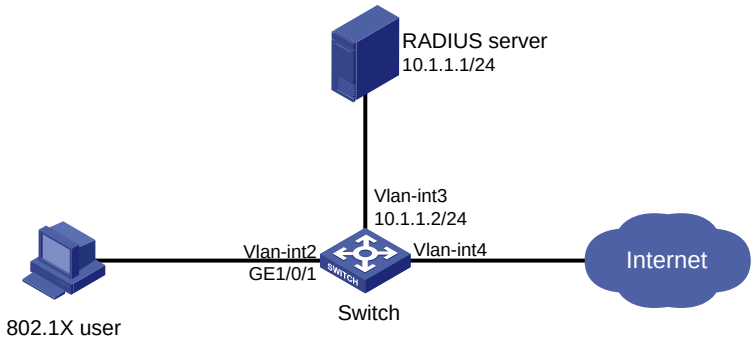
Verify that the user can use the commands permitted by the level-0 user role. (Details not shown.)

Example: Configuring AAA for 802.1X users by a RADIUS server

Network configuration

As shown in Figure 24, configure the switch to meet the following requirements:

- Use the RADIUS server for authentication, authorization, and accounting of 802.1X users.



- Use MAC-based access control on GigabitEthernet 1/0/1 to authenticate all 802.1X users on the port separately.
- Include domain names in the usernames sent to the RADIUS server.

In this example, the RADIUS server runs IMC PLAT 7.1 (E0303), IMC UAM 7.1 (E0304), and IMC CAMS 7.1 (E0301). On the RADIUS server, perform the following tasks:

- Add a service that charges 120 dollars for up to 120 hours per month and assigns authenticated users to VLAN 4.
- Configure a user with name **dot1x@bbb** and assign the service to the user.

Set the shared keys to **expert** for secure RADIUS communication. Set the ports for authentication and accounting to 1812 and 1813, respectively.

Figure 24 Network diagram

Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

   Log in to IMC, click the **User** tab, and select **User Access Policy** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the ports for authentication and accounting to 1812 and 1813, respectively.

   b. Select **LAN Access Service** from the **Service Type** list.

   c. Select **H3C(General)** from the **Access Device Type** list.

   d. Set the shared key to **expert** for secure authentication and accounting communication.

   e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.

   f. Use the default values for other parameters and click **OK**.

   The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

   - IP address specified by using the **`nas-ip`** command.
   - IP address specified by using the **`radius nas-ip`** command.
   - IP address of the outbound interface (the default).

Figure 25 Adding the switch as an access device

2. Add a charging plan:

   Click the **User** tab, and select **Accounting Manager** > **Charging Plans** from the navigation tree to enter the charging plan configuration page. Then, click **Add** to configure a charging plan as follows:

   a. Add a plan named **UserAcct**.

   b. Select **Flat rate** from the **Charging Template** list.

   c. Select **time** for **Charge Based on**, select **Monthly** for **Billing Term**, and enter **120** in the **Fixed Fee** field.

   d. Enter **120** in the **Usage Threshold** field and select **hr** (hours) for the **in** field. The configuration allows the user to access the Internet for up to 120 hours per month.

   e. Click **OK**.

Figure 26 Adding a charging plan

3. Add an access policy:

   Click the **User** tab, and select **User Access Policy** > **Access Policy** from the navigation tree. Then, click **Add** to configure an access policy as follows:

   a. Enter access policy name **Dot1x auth**.

   b. Set the ID of the VLAN to be deployed to **4**.

   c. Configure other parameters as needed.

   d. Click **OK**.

Figure 27 Adding an access policy

4. Add an access service:

   Click the **User** tab, and select **User Access Policy** > **Access Service** from the navigation tree. Then, click **Add** to configure a service as follows:

   a. Add a service named **Dot1x Service,** and set the service suffix to **bbb**, the authentication domain for the 802.1X user. With the service suffix configured, you must configure the access device to send usernames that include domain names to the RADIUS server.

   b. Select **UserAcct** from the **Charging Plan** list.

   c. Select **Dot1x auth** from the **Default Access Policy** list.

   d. Configure other parameters as needed.

   e. Click **OK**.

Figure 28 Adding an access service

5. Add a user:

   Click the **User** tab, and select **All Access Users** from the navigation tree to enter the **All Access Users** page. Then, click **Add** to configure a user as follows:

   a. Select the user or add a user named **test**.

   b. Specify the account name as **dot1x** and configure the password.

   c. Select **Dot1x Service** in the **Access Service** area.

   d. Configure other parameters as needed and click **OK**.

Figure 29 Adding an access user account

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rad** and enter RADIUS scheme view.

   ```
   <Switch> system-view
   ```

```
[Switch] radius scheme rad
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rad] primary authentication 10.1.1.1
[Switch-radius-rad] primary accounting 10.1.1.1
[Switch-radius-rad] key authentication simple expert
[Switch-radius-rad] key accounting simple expert
```

Include domain names in the usernames sent to the RADIUS server.

```
[Switch-radius-rad] user-name-format with-domain
[Switch-radius-rad] quit
```

2. Configure an ISP domain:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [Switch] domain bbb
   ```

   # Configure the ISP domain to use RADIUS scheme **rad** for authentication, authorization, and accounting of LAN users.

   ```
   [Switch-isp-bbb] authentication lan-access radius-scheme rad
   [Switch-isp-bbb] authorization lan-access radius-scheme rad
   [Switch-isp-bbb] accounting lan-access radius-scheme rad
   [Switch-isp-bbb] quit
   ```

3. Configure 802.1X authentication:

   # Enable 802.1X globally.

   ```
   [Switch] dot1x
   ```

   # Enable 802.1X for GigabitEthernet 1/0/1.

   ```
   [Switch] interface gigabitethernet 1/0/1
   [Switch-GigabitEthernet1/0/1] dot1x
   ```

   # Configure the access control method. By default, an 802.1X-enabled port uses the MAC-based access control.

   ```
   [Switch-GigabitEthernet1/0/1] dot1x port-method macbased
   ```

Verifying the configuration

1. On the host, use account **dot1x@bbb** to pass 802.1X authentication:

   # If the host runs the Windows XP 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.
   b. Select the **Enable IEEE 802.1X authentication for this network** option.
   c. Select MD5 challenge as the EAP type.
   d. Click **OK**.

   The user passes authentication after entering the correct username and password on the authentication page.

   # If the host runs the iNode client, no advanced authentication options are required. The user can pass authentication after entering username **dot1x@bbb** and the correct password on the client property page.

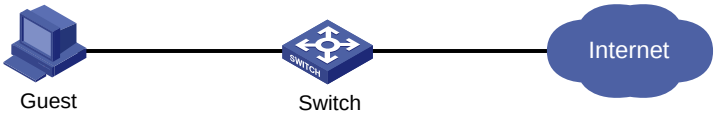
IMPORTANT:

Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

2. On the switch, verify that the server assigns the port connecting the client to VLAN 4 after the user passes authentication. (Details not shown.)

3. Display 802.1X connection information on the switch.

```
[Switch] display dot1x connection
```



Example: Configuring and managing a local guest

Network configuration

As shown in Figure 30, create an 802.1X local guest named **user1** for Jack. Configure local guest attributes and manage the local guest on the switch as follows:

- Configure attributes for the local guest, including the password, user group, validity period, and sponsor information.
- Enable the local user auto-delete feature.
- Specify an SMTP server and email sender address for the device to send local guest email notifications.
- Configure email addresses for the local guest, guest manager, and guest sponsor.
- Configure the subject and body of the email notifications to be sent to the guest, guest sponsor, and guest manager.
- Send email notifications of the local guest account information to the guest and guest sponsor.

Figure 30 Network diagram

Procedure

1. Configure 802.1X settings. Make sure the guest can pass 802.1X authentication to access the network. (Details not shown.)
2. Manage local guests:

   # Enable the local user auto-delete feature for expired local guests.

   ```
   <Switch> system-view
   [Switch] local-user auto-delete enable
   ```

   # Specify an SMTP server to send local guest email notifications.

   ```
   [Switch] local-guest email smtp-server smtp://192.168.0.112/smtp
   ```

   # Specify the email sender address as **bbb@ccc.com** in the email notifications sent by the device for local guests.

   ```
   [Switch] local-guest email sender bbb@ccc.com
   ```

   # Specify the email address of the guest manager as **guest-manager@ccc.com**.

   ```
   [Switch] local-guest manager-email guest-manager@ccc.com
   ```

   # Configure the subject and body of the email notifications to be sent to the local guest.

   ```
   [Switch] local-guest email format to guest subject Guest account information
   [Switch] local-guest email format to guest body A guest account has been created for
   you. The username, password, and validity period of the account are given below.
   ```

   # Configure the subject and body of the email notifications to be sent to the guest sponsor.

   ```
   [Switch] local-guest email format to sponsor subject Guest account information
   [Switch] local-guest email format to sponsor body A guest account has been created
   for you. The username, password, and validity period of the account are given below.
   ```

   # Configure the subject and body of the email notifications to be sent to the guest manager.

   ```
   [Switch] local-guest email format to manager subject Guest registration information
   ```

```
[Switch] local-guest email format to manager body A guest account has been registered.
The username of the account is given below. Please approve the registration
information.
```

3. Configure the local guest:

   # Create a user group named **guest1**.

   ```
   [Switch] user-group guest1
   [Switch-ugroup-guest1] quit
   ```

   # Create a local guest named **user1** and enter local guest view.

   ```
   [Switch] local-user user1 class network guest
   ```

   # Set the guest password to **123456** in plain text.

   ```
   [Switch-luser-network(guest)-user1] password simple 123456
   ```

   # Assign the guest to user group **guest1**.

   ```
   [Switch-luser-network(guest)-user1] group guest1
   ```

   # Specify the name of the local guest.

   ```
   [Switch-luser-network(guest)-user1] full-name Jack
   ```

   # Specify the company of the local guest.

   ```
   [Switch-luser-network(guest)-user1] company cc
   ```

   # Configure the email address of the local guest.

   ```
   [Switch-luser-network(guest)-user1] email Jack@cc.com
   ```

   # Configure the phone number of the local guest.

   ```
   [Switch-luser-network(guest)-user1] phone 131129237
   ```

   # Configure a description for the local guest.

   ```
   [Switch-luser-network(guest)-user1] description A guest from company cc
   ```

   # Configure the validity period of the local guest.

   ```
   [Switch-luser-network(guest)-user1] validity-datetime from 2015/4/1 08:00:00 to
   2015/4/3 18:00:00
   ```

   # Specify the guest sponsor name as **Sam**.

   ```
   [Switch-luser-network(guest)-user1] sponsor-full-name Sam
   ```

   # Configure the email address of the guest sponsor.

   ```
   [Switch-luser-network(guest)-user1] sponsor-email Sam@aa.com
   ```

   # Configure the department of the guest sponsor as **security**.

   ```
   [Switch-luser-network(guest)-user1] sponsor-department security
   [Switch-luser-network(guest)-user1] quit
   [Switch] quit
   ```

4. Configure the device to send guest email notifications:

   # Send an email notification to the guest sponsor.

   ```
   <Switch> local-guest send-email user-name user1 to sponsor
   ```

   # Send an email notification to the guest.

   ```
   <Switch> local-guest send-email user-name user1 to guest
   ```

Verifying the configuration

Display local guest information.

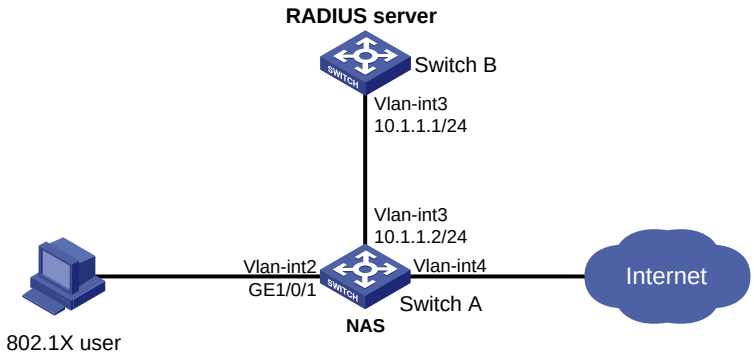
```
<Switch> display local-user user-name user1 class network guest
Total 1 local users matched.

Network access guest user1:
  State:                    Active
```

```
Service type:              LAN-access/Portal
User group:                guest1
Full name:                 Jack
Company:                   cc
Email:                     Jack@cc.com
Phone:                     131129237
Description:               A guest from company cc
Sponsor full name:         Sam
Sponsor department:        security
Sponsor email:             Sam@aa.com
Description:               A guest from company cc
Validity period:
  Start date and time:     2015/04/01-08:00:00
  Expiration date and time:2015/04/03-18:00:00
```

Verify that Jack can use username **user1** and password **123456** to pass local authentication and come online during the validity period. (Details not shown.)

Example: Configuring authentication and authorization for 802.1X users by the device as a RADIUS server



Network configuration

As shown in Figure 31, Switch B acts as the RADIUS server for authentication and authorization of 802.1X users connected to the NAS (Switch A).

Configure the switches to meet the following requirements:

- Perform 802.1X user authentication on GigabitEthernet 1/0/1 of the NAS.
- The shared key is **expert** and the authentication port is 1812.
- Exclude domain names from the usernames sent to the RADIUS server.
- The user name for 802.1X authentication is **dot1x**.
- After the user passes authentication, the RADIUS server authorizes VLAN 4 to the NAS port that the user is connecting to.

Figure 31 Network diagram

Procedure

1. Configure the NAS:
   a. Configure a RADIUS scheme:
      # Configure a RADIUS scheme named **rad** and enter RADIUS scheme view.

```
<SwitchA> system-view
[SwitchA] radius scheme rad
```

Specify the primary authentication server with IP address 10.1.1.1 and set the shared key to **expert** in plaintext form.

```
[SwitchA-radius-rad] primary authentication 10.1.1.1 key simple expert
```

Exclude domain names from the usernames sent to the RADIUS server.

```
[SwitchA-radius-rad] user-name-format without-domain
[SwitchA-radius-rad] quit
```

b. Configure an ISP domain:

Create an ISP domain named **bbb** and enter ISP domain view.

```
[SwitchA] domain bbb
```

Configure the ISP domain to use RADIUS scheme **rad** for authentication and authorization of LAN users and not to perform accounting for LAN users.

```
[SwitchA-isp-bbb] authentication lan-access radius-scheme rad
[SwitchA-isp-bbb] authorization lan-access radius-scheme rad
[SwitchA-isp-bbb] accounting lan-access none
[SwitchA-isp-bbb] quit
```

c. Configure 802.1X authentication:

Enable 802.1X for GigabitEthernet 1/0/1.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] dot1x
```

Specify **bbb** as the mandatory authentication domain for 802.1X users on the interface.

```
[SwitchA-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
[SwitchA-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[SwitchA] dot1x
```

2. Configure the RADIUS server:

Create a network access user named **dot1x**.

```
<SwitchB> system-view
[SwitchB] local-user dot1x class network
```

Configure the password as **123456** in plaintext form.

```
[SwitchB-luser-network-dot1x] password simple 123456
```

Configure VLAN 4 as the authorization VLAN.

```
[SwitchB-luser-network-dot1x] authorization-attribute vlan 4
[SwitchB-luser-network-dot1x] quit
```

Configure the IP address of the RADIUS client as 10.1.1.2 and the shared key as **expert** in plaintext form.

```
[SwitchB] radius-server client ip 10.1.1.2 key simple expert
```

Activate the RADIUS server configuration.

```
[SwitchB] radius-server activate
```

Verifying the configuration

1. On the RADIUS server, display the activated RADIUS clients and users.

```
[SwitchB] display radius-server active-client
Total 1 RADIUS clients.
Client IP: 10.1.1.2
[SwitchB] display radius-server active-user dot1x
Total 1 RADIUS users matched.
```

```
Username: dot1x
  Description: Not configured
  Authorization attributes:
    VLAN ID: 4
    ACL number: Not configured
  Validity period:
    Expiration time: Not configured
```

2. On the host, use account **dot1x** for 802.1X authentication.

   If the host runs the Windows built-in 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.

   b. Select the **Enable IEEE 802.1X authentication for this network** option.

   c. Select MD5 challenge as the EAP type.

   d. Click **OK**.

   If the host runs the iNode client, no advanced authentication options are required. The user passes authentication after entering the correct user name and password on the authentication page or the iNode client.

IMPORTANT:

Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

3. On the NAS, verify that the RADIUS server assigns the port to VLAN 4 after the user passes authentication. (Details not shown.)
4. On the NAS, display online 802.1X user information.

```
[SwitchA] display dot1x connection
```

Troubleshooting AAA

RADIUS authentication failure

Symptom

User authentication always fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the RADIUS server.
- The password entered by the user is incorrect.
- The RADIUS server and the NAS are configured with different shared keys.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the RADIUS server can ping each other.

- The username is in the *userid@isp-name* format and the ISP domain is correctly configured on the NAS.
- The user is configured on the RADIUS server.
- The correct password is entered.
- The same shared key is configured on both the RADIUS server and the NAS.

2. If the problem persists, contact H3C Support.

RADIUS packet delivery failure

Symptom

RADIUS packets cannot reach the RADIUS server.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The NAS is not configured with the IP address of the RADIUS server.
- The authentication and accounting UDP ports configured on the NAS are incorrect.
- The RADIUS server's authentication and accounting port numbers are being used by other applications.

Solution

To resolve the problem:

1. Verify the following items:
   - The link between the NAS and the RADIUS server works well at both the physical and data link layers.
   - The IP address of the RADIUS server is correctly configured on the NAS.
   - The authentication and accounting UDP port numbers configured on the NAS are the same as those of the RADIUS server.
   - The RADIUS server's authentication and accounting port numbers are available.
2. If the problem persists, contact H3C Support.

RADIUS accounting error

Symptom

A user is authenticated and authorized, but accounting for the user is not normal.

Analysis

The accounting server configuration on the NAS is not correct. Possible reasons include:

- The accounting port number configured on the NAS is incorrect.
- The accounting server IP address configured on the NAS is incorrect. For example, the NAS is configured to use a single server to provide authentication, authorization, and accounting services, but in fact the services are provided by different servers.

Solution

To resolve the problem:

1. Verify the following items:
   - The accounting port number is correctly configured.
   - The accounting server IP address is correctly configured on the NAS.

2. If the problem persists, contact H3C Support.

Troubleshooting HWTACACS

Similar to RADIUS troubleshooting. See "RADIUS authentication failure," "RADIUS packet delivery failure," and "RADIUS accounting error."

LDAP authentication failure

Symptom

User authentication fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the LDAP server.
- The LDAP server IP address or port number configured on the NAS is not correct.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the LDAP server.
- The password entered by the user is incorrect.
- The administrator DN or password is not configured.
- Some user attributes (for example, the username attribute) configured on the NAS are not consistent with those configured on the server.
- No user search base DN is specified for the LDAP scheme.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the LDAP server can ping each other.
   - The IP address and port number of the LDAP server configured on the NAS match those of the server.
   - The username is in the correct format and the ISP domain for the user authentication is correctly configured on the NAS.
   - The user is configured on the LDAP server.
   - The correct password is entered.
   - The administrator DN and the administrator password are correctly configured.
   - The user attributes (for example, the username attribute) configured on the NAS are consistent with those configured on the LDAP server.
   - The user search base DN for authentication is specified.
2. If the problem persists, contact H3C Support.

Appendixes

Appendix A Commonly used RADIUS attributes

Commonly used RADIUS attributes are defined in RFC 2865, RFC 2866, RFC 2867, and RFC 2868.

Table 5 Commonly used RADIUS attributes

No.	Attribute	No.	Attribute
1	User-Name	45	Acct-Authentic
2	User-Password	46	Acct-Session-Time
3	CHAP-Password	47	Acct-Input-Packets
4	NAS-IP-Address	48	Acct-Output-Packets
5	NAS-Port	49	Acct-Terminate-Cause
6	Service-Type	50	Acct-Multi-Session-Id
7	Framed-Protocol	51	Acct-Link-Count
8	Framed-IP-Address	52	Acct-Input-Gigawords
9	Framed-IP-Netmask	53	Acct-Output-Gigawords
10	Framed-Routing	54	(unassigned)
11	Filter-ID	55	Event-Timestamp
12	Framed-MTU	56-59	(unassigned)
13	Framed-Compression	60	CHAP-Challenge
14	Login-IP-Host	61	NAS-Port-Type
15	Login-Service	62	Port-Limit
16	Login-TCP-Port	63	Login-LAT-Port
17	(unassigned)	64	Tunnel-Type
18	Reply-Message	65	Tunnel-Medium-Type
19	Callback-Number	66	Tunnel-Client-Endpoint
20	Callback-ID	67	Tunnel-Server-Endpoint
21	(unassigned)	68	Acct-Tunnel-Connection
22	Framed-Route	69	Tunnel-Password
23	Framed-IPX-Network	70	ARAP-Password
24	State	71	ARAP-Features
25	Class	72	ARAP-Zone-Access
26	Vendor-Specific	73	ARAP-Security
27	Session-Timeout	74	ARAP-Security-Data

35	Login-LAT-Node	82	Tunnel-Assignment-id

No.	Attribute	No.	Attribute
36	Login-LAT-Group	83	Tunnel-Preference
37	Framed-AppleTalk-Link	84	ARAP-Challenge-Response
38	Framed-AppleTalk-Network	85	Acct-Interim-Interval
39	Framed-AppleTalk-Zone	86	Acct-Tunnel-Packets-Lost
40	Acct-Status-Type	87	NAS-Port-Id
41	Acct-Delay-Time	88	Framed-Pool
42	Acct-Input-Octets	89	(unassigned)
43	Acct-Output-Octets	90	Tunnel-Client-Auth-id
44	Acct-Session-Id	91	Tunnel-Server-Auth-id

Appendix B Descriptions for commonly used standard RADIUS attributes

No.	Attribute	Description
1	User-Name	Name of the user to be authenticated.
2	User-Password	User password for PAP authentication, only present in Access-Request packets when PAP authentication is used.
3	CHAP-Password	Digest of the user password for CHAP authentication, only present in Access-Request packets when CHAP authentication is used.
4	NAS-IP-Address	IP address for the server to use to identify the client. Typically, a client is identified by the IP address of its access interface. This attribute is only present in Access-Request packets.
5	NAS-Port	Physical port of the NAS that the user accesses.
6	Service-Type	Type of service that the user has requested or type of service to be provided.
7	Framed-Protocol	Encapsulation protocol for framed access.
8	Framed-IP-Address	IP address assigned to the user.
11	Filter-ID	Name of the filter list. If the name starts with a digit, it indicates an ACL number. If the name does not start with a digit, it indicates a user profile name.
12	Framed-MTU	MTU for the data link between the user and NAS. For example, this attribute can be used to define the maximum size of EAP packets allowed to be processed in 802.1X EAP authentication.
14	Login-IP-Host	IP address of the NAS interface that the user accesses.
15	Login-Service	Type of service that the user uses for login.
18	Reply-Message	Text to be displayed to the user, which can be used by the server to communicate information, for example, the cause of the authentication failure.
26	Vendor-Specific	Vendor-specific proprietary attribute. A packet can contain one or more proprietary attributes, each of which can contain one or more subattributes.

No.	Attribute	Description
27	Session-Timeout	Maximum service duration for the user before termination of the session.
28	Idle-Timeout	Maximum idle time permitted for the user before termination of the session.
31	Calling-Station-Id	User identification that the NAS sends to the server. For the LAN access service provided by an H3C device, this attribute includes the MAC address of the user.
32	NAS-Identifier	Identification that the NAS uses to identify itself to the RADIUS server.
40	Acct-Status-Type	Type of the Accounting-Request packet. Possible values include: • **1**—Start. • **2**—Stop. • **3**—Interim-Update. • **4**—Reset-Charge. • **7**—Accounting-On. (Defined in the 3rd Generation Partnership Project.) • **8**—Accounting-Off. (Defined in the 3rd Generation Partnership Project.) • **9 to 14**—Reserved for tunnel accounting. • **15**—Reserved for failed.
45	Acct-Authentic	Authentication method used by the user. Possible values include: • **1**—RADIUS. • **2**—Local. • **3**—Remote.
60	CHAP-Challenge	CHAP challenge generated by the NAS for MD5 calculation during CHAP authentication.
61	NAS-Port-Type	Type of the physical port of the NAS that is authenticating the user. Possible values include: • **15**—Ethernet. • **16**—Any type of ADSL. • **17**—Cable. (With cable for cable TV.) • **19**—WLAN-IEEE 802.11. • **201**—VLAN. • **202**—ATM. If the port is an ATM or Ethernet one and VLANs are implemented on it, the value of this attribute is 201.
64	Tunnel-Type	Tunneling protocols used. The value **13** represents VLAN. If the value is 13, the device interprets the Tunnel-Type, Tunnel-Medium-Type, and Tunnel-Private-Group-ID attributes as attributes to assign VLANs.
65	Tunnel-Medium-Type	Transport medium type to use for creating a tunnel. For VLAN assignment, the value must be **6** to indicate the 802 media plus Ethernet.
79	EAP-Message	Used to encapsulate EAP packets to allow RADIUS to support EAP authentication.
80	Message-Authenticator	Used for authentication and verification of authentication packets to prevent spoofing Access-Requests. This attribute is present when EAP authentication is used.
81	Tunnel-Private-Group-ID	Group ID for a tunnel session. To assign VLANs, the NAS conveys

No.	Attribute	Description
		VLAN IDs by using this attribute.
87	NAS-Port-Id	String for describing the port of the NAS that is authenticating the user.
168	Framed-IPv6-Address	Server-assigned IPv6 address for the NAS to assign to the host. The address must be unique.

Appendix C RADIUS subattributes (vendor ID 25506)

Table 6 lists all RADIUS subattributes with a vendor ID of 25506. Support for these subattributes depends on the device model.

Table 6 RADIUS subattributes (vendor ID 25506)

No.	Subattribute	Description
1	Input-Peak-Rate	Peak rate in the direction from the user to the NAS, in bps.
2	Input-Average-Rate	Average rate in the direction from the user to the NAS, in bps.
3	Input-Basic-Rate	Basic rate in the direction from the user to the NAS, in bps.
4	Output-Peak-Rate	Peak rate in the direction from the NAS to the user, in bps.
5	Output-Average-Rate	Average rate in the direction from the NAS to the user, in bps.
6	Output-Basic-Rate	Basic rate in the direction from the NAS to the user, in bps.
15	Remanent_Volume	Total amount of data available for the connection, in different units for different server types.
17	ISP-ID	ISP domain where the user obtains authorization information.
20	Command	Operation for the session, used for session control. Possible values include: • **1**—Trigger-Request. • **2**—Terminate-Request. • **3**—SetPolicy. • **4**—Result. • **5**—PortalClear.
25	Result_Code	Result of the Trigger-Request or SetPolicy operation, zero for success and any other value for failure.
26	Connect_ID	Index of the user connection.
27	PortalURL	PADM redirect URL assigned to PPPoE users.
28	Ftp_Directory	FTP, SFTP, or SCP user working directory. When the RADIUS client acts as the FTP, SFTP, or SCP server, this attribute is used to set the working directory for an FTP, SFTP, or SCP user on the RADIUS client.
29	Exec_Privilege	EXEC user priority.
32	NAT-IP-Address	Public IP address assigned to the user when the source IP address and port are translated.
33	NAT-Start-Port	Start port number of the port range assigned to the user when the source IP address and port are translated.
34	NAT-End-Port	End port number of the port range assigned to the user when the source IP address and port are translated.

No.	Subattribute	Description
59	NAS_Startup_Timestamp	Startup time of the NAS in seconds, which is represented by the time elapsed after 00:00:00 on Jan. 1, 1970 (UTC).
60	Ip_Host_Addr	User IP address and MAC address included in authentication and accounting requests, in the format A.B.C.D hh:hh:hh:hh:hh:hh. A space is required between the IP address and the MAC address.
61	User_Notify	Information that must be sent from the server to the client transparently.
62	User_HeartBeat	Hash value assigned after an 802.1X user passes authentication, which is a 32-byte string. This attribute is stored in the user list on the NAS and verifies the handshake packets from the 802.1X user. This attribute only exists in Access-Accept and Accounting-Request packets.
98	Multicast_Receive_Group	IP address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
100	IP6_Multicast_Receive_Group	IPv6 address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
101	MLD-Access-Limit	Maximum number of MLD multicast groups that the user can join concurrently.
102	local-name	L2TP local tunnel name.
103	IGMP-Access-Limit	Maximum number of IGMP multicast groups that the user can join concurrently.
104	VPN-Instance	MPLS L3VPN instance to which a user belongs.
105	ANCP-Profile	ANCP profile name.
135	Client-Primary-DNS	IP address of the primary DNS server.
136	Client-Secondary-DNS	IP address of the secondary DNS server.
140	User_Group	User groups assigned after the user passes authentication. Typically, a user can belong to only one user group.
144	Acct_IPv6_Input_Octets	Bytes of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
145	Acct_IPv6_Output_Octets	Bytes of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
146	Acct_IPv6_Input_Packets	Number of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
147	Acct_IPv6_Output_Packets	Number of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
148	Acct_IPv6_Input_Gigawords	Bytes of IPv6 packets in the inbound direction. The measurement unit is 4G bytes.
149	Acct_IPv6_Output_Gigawords	Bytes of IPv6 packets in the outbound direction. The measurement unit is 4G bytes.
155	User-Roles	List of space-separated user roles.
210	Av-Pair	User-defined attribute pair. Available attribute pairs include: • Server-assigned voice VLAN in the format of device-traffic-class=voice.

No.	Subattribute	Description

		• Server-assigned user role in the format of shell:role=xxx.
		• Server-assigned ACL in the format of url-redirect-acl=xxx.
		• Server-assigned IPv4 Web redirect URL in the format of url-redirect=xxx.
		• Server-assigned IPv6 Web redirect URL in the format of urlipv6-redirect=xxx.
		• Server-deployed command to reboot a port, in the format of subscriber:command=bounce-host-port.
		• Server-assigned port shutdown duration in the format of bounce:seconds=xxx.
		• Server-deployed command to shut down a port, in the format of subscriber:command=disable-host-port.
		• Server-assigned blackhole MAC address attribute in the format of mac:block-mac=xxx.
		• Server-assigned MAC authentication offline detect timer (in seconds) in the format of mac-authentication: offline-detect-time=xxx. Value 0 of xxx indicates that MAC authentication offline detection is disabled.
		• Server-assigned MAC authentication offline detection flag in the format of mac-authentication: offline-detect-check=x. x has the following values:
		  ○ **0**—The device does not search for the ARP snooping entry or ND snooping entry of the MAC address.
		  ○ **1**—The device searches for the ARP snooping entry or ND snooping entry of the MAC address.
		• Server-assigned dynamic ACL. For more information about the format of this attribute, see "Appendix D Format of dynamic authorization ACLs." Support for this attribute in 802.1X authentication and MAC authentication depends on the device model. If the server assigns a user both this attribute and the Filter-ID attribute, the device will ignore this attribute. The device does not support using CoA messages to change the content assigned by this attribute or assign another ACL to the user.

215	Accounting-Level	ITA traffic level in the range of 1 to 8.
216	Ita-Policy	ITA policy name.
230	NAS-Port-Name	Interface through which the user is connected to the NAS.
246	Auth_Detail_Result	Accounting details. The server sends Access-Accept packets with subattributes 246 and 250 in the following situations: • **1**—The subscriber charge is overdue. The subscriber is allowed to access network resources in the whitelist. If the subscriber accesses other network resources, the device redirects it to the URL specified by subattribute 250. • **2**—The broadband lease of the subscriber expires. The device redirects the subscriber to the URL specified by subattribute 250 when the subscriber requests to access webpages for the first time.
247	Input-Committed-Burst-Size	Committed burst size from the user to the NAS, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the Input-Average-Rate attribute.
248	Output-Committed-Burst-Size	Committed burst size from the NAS to the user, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the

No.	Subattribute	Description
		Output-Average-Rate attribute.
249	authentication-type	Authentication type. The value can be: • **1**—Intranet access authentication. • **2**—Internet access authentication. If the packet does not contain this subattribute, common authentication applies.
250	WEB-URL	Redirect URL for users. In single-stack scenarios, use this attribute to assign the authorized IPv4 URL or IPv6 URL. In dual-stack scenarios, use this attribute to assign the authorized IPv4 URL and use user-defined attribute pair **urlipv6-redirect** to assign the authorized IPv6 URL.
251	Subscriber-ID	Family plan ID.
252	Subscriber-Profile	QoS policy name for the family plan of the subscriber.
255	Product_ID	Product name.

Appendix D Format of dynamic authorization ACLs

Vendor ID 25506

The server might assign a dynamic authorization ACL that contains multiple rules to a user in different ways:

- Assign only one Av-Pair subattribute to the user. In this subattribute, the dynamic ACL contains multiple rules separated by question marks (?).
- Assign multiple Av-Pair subattributes to the user. All the subattributes contain the same dynamic ACL and a different rule. Support for this method depends on the server model.

The format of a dynamic ACL rule is as follows:

aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*?protocol=*protocol-type*?counting?dst-ip=*ip-addr*?src-ip=*ip-addr*?dst-port=*port-value*?src-port=*port-value*?action=*action-type*

The fields in the rule are described in Table 7. The following is an example of a dynamic ACL rule:

aclrule?same?test?1?1?1?protocol=3?counting?dst-ip=1.1.1.1/1.1.1.1?src-ip=1.1.1.1/0?dst-port=1.2000?src-port=5.2000-3000?action=1

Table 7 Fields in a dynamic ACL rule

Field	Description	Remarks
aclrule	Indicates that the following part is information about a dynamic ACL rule.	Required
same	Indicates that the current user will inherit the dynamic ACL rules that have been successfully assigned to another authenticated user. If the server assigns one user the same dynamic ACL as another user but the rules are different for the two users, the device applies the dynamic ACL rules of the user that comes online first to the other user.	Required
acl-name	ACL name, a case-insensitive string of 1 to 63 characters. The ACL name must begin with a letter and it cannot be **all** or the same as an existing static ACL on the device.	Required

Field	Description	Remarks
acl-type	ACL type. **1** indicates an advanced ACL. In the current software version, only advanced ACLs are supported.	Required
ver-type	IP protocol type: • **1**—IPv4. • **2**—IPv6.	Required
rule-id	ACL rule number, in the range of 0 to 65534.	Required
protocol-type	Protocol type: • **1**—IP. • **2**—ICMP. • **3**—TCP. • **4**—UDP. • **5**—ICMPv6. • **6**—IPv6.	Optional
counting	Indicates that rule match statistics is enabled. If a rule does not include this field, rule match statistics is disabled for the rule.	Optional
ip-addr	IP address information. For example, 1.1.1.1/1.1.1.1, 1.1.1.1/0, or 3::3/128. If the value is **any**, the rule matches any IP address.	Optional

port-value	TCP or UDP port information, in the *X*.*YYY* format.
	• ***X***—Operator.
	  ○ **1**—Equal to.
	  ○ **2**—Greater than.
	  ○ **3**—Smaller than.
	  ○ **4**—Not equal to.
	  ○ **5**—In the range of.
	• ***YYY***—Port number information.
	For example, 1.3000 and 5.2000-3000.
		Optional

action-type	Action type: • **1**—Deny. • **2**—Permit.	Optional

The following restrictions apply to dynamic authorization ACLs:

- For the former six fields (aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*) of a dynamic ACL rule, their positions are fixed. The device cannot interpret a dynamic ACL rule if the positions of the six fields are changed. For the other fields, position changes are allowed.
- The settings for all the fields in the rules must meet the configuration logic of ACL rules on the device so the device can correctly interpret the rules.
- All dynamic ACL rules in one authorization must belong to the same ACL name.
- A dynamic ACL must have rules and the format of the rules must be valid.

Vendor ID 9

The server might assign a dynamic ACL to a user by using the CISCO-AV-Pair subattribute (vendor ID 9). The formats of the subattribute are as follows:

- **CiscoSecure-Defined-ACL=#ACSACL#-IP-***name***-***number*

  The *name* argument represents the ACL name and the *number* argument represents the version number.

  For example: **CiscoSecure-Defined-ACL=#ACSACL#-IP-UACL-0**.

- **ip:inacl#***number***=***rule*

  The *number* argument represents the ACL rule number and the *rule* argument represents the rule content.

  For example: **ip:inacl#1=permit udp any any eq 21862**.

Currently, only some device models support the CISCO-AV-Pair subattribute for 802.1X and MAC authentication. If the RADIUS server assigns dynamic ACLs to a user by using both the CISCO-AV-Pair (vendor ID 9) and Av-Pair (vendor ID 25506) subattributes, the device ignores the CISCO-AV-Pair subattribute.

The server assigns a dynamic ACL to a user as follows:

1. The server assigns a dynamic ACL name to a user by using the CISCO-AV-Pair subattribute in the format of **CiscoSecure-Defined-ACL=#ACSACL#-IP-***name***-***number* after the user passes authentication.
2. The device uses the dynamic ACL name as the username of the user to initiate authentication again.
3. The server assigns one or multiple ACL rules to the user by using the CISCO-AV-Pair subattribute in the format of **ip:inacl#***number***=***rule* after the user passes authentication.
4. The device parses the ACL rules received from the server, creates the ACL and its rules, and deploys the ACL and its rules to the user.

   In the current software version, the device can parse only the dynamic ACL rules in the following formats:

   { **deny** | **permit** } *protocol* [**destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*]]

   The value for the *operator* argument can be **lt** (lower than), **gt** (greater than), **eq** (equal to), or **neq** (not equal to).

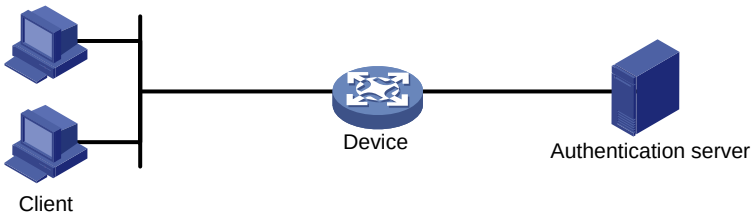
802.1X overview

About the 802.1X protocol



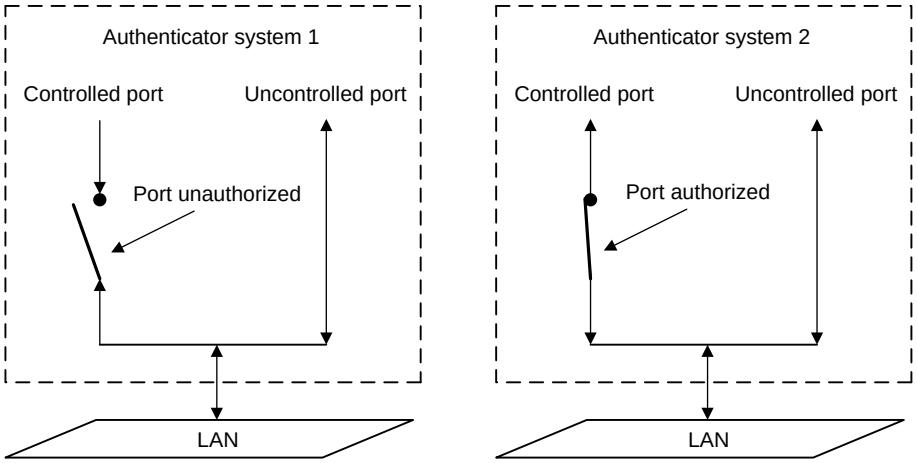
802.1X is a port-based network access control protocol widely used on Ethernet networks. The protocol controls network access by authenticating the devices connected to 802.1X-enabled LAN ports.

802.1X architecture

802.1X operates in the client/server model. As shown in Figure 1, 802.1X authentication includes the following entities:

- **Client (supplicant)**—A user terminal seeking access to the LAN. The terminal must have 802.1X software to authenticate to the access device.
- **Access device (authenticator)**—Authenticates the client to control access to the LAN. In a typical 802.1X environment, the access device uses an authentication server to perform authentication.
- **Authentication server**—Provides authentication services for the access device. The authentication server first authenticates 802.1X clients by using the data sent from the access device. Then, the server returns the authentication results to the access device to make access decisions. The authentication server is typically a RADIUS server. In a small LAN, you can use the access device as the authentication server.

Figure 1 802.1X architecture



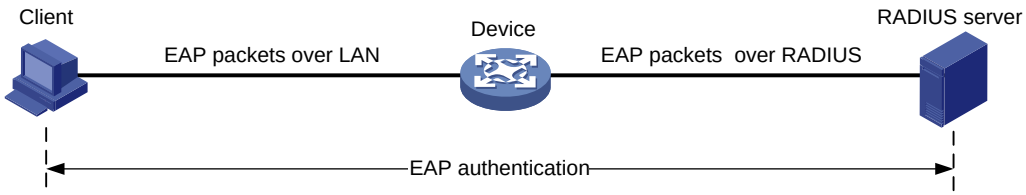
Controlled/uncontrolled port and port authorization status

802.1X defines two logical ports for the network access port: controlled port and uncontrolled port. Any packet arriving at the network access port is visible to both logical ports.

- **Uncontrolled port**—Is always open to receive and transmit authentication packets.
- **Controlled port**—Filters packets depending on the port state.
  - **Authorized state**—The controlled port is in authorized state when the client has passed authentication. The port allows traffic to pass through.
  - **Unauthorized state**—The port is in unauthorized state when the client has failed authentication. The port controls traffic by using one of the following methods:
    - Performs bidirectional traffic control to deny traffic to and from the client.
    - Performs unidirectional traffic control to deny traffic from the client. The device supports only unidirectional traffic control.

Figure 2 Authorization state of a controlled port

Packet exchange methods



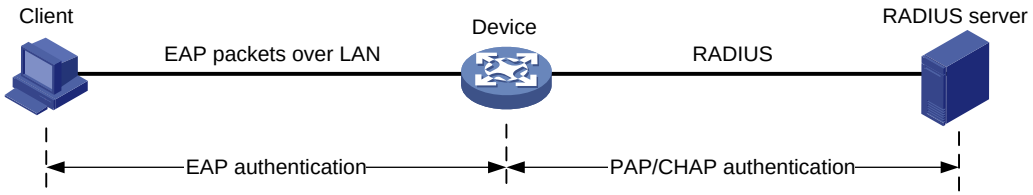
802.1X uses the Extensible Authentication Protocol (EAP) to transport authentication information for the client, the access device, and the authentication server. EAP is an authentication framework that uses the client/server model. The framework supports a variety of authentication methods, including MD5-Challenge, EAP-Transport Layer Security (EAP-TLS), and Protected EAP (PEAP).

802.1X defines EAP over LAN (EAPOL) for passing EAP packets between the client and the access device over a wired or wireless LAN. Between the access device and the authentication server, 802.1X delivers authentication information by either EAP relay or EAP termination.

EAP relay

EAP relay is defined in IEEE 802.1X. In this mode, the network device uses EAP over RADIUS (EAPOR) packets to send authentication information to the RADIUS server, as shown in Figure 3.

Figure 3 EAP relay



In EAP relay mode, the client must use the same authentication method as the RADIUS server. On the access device, you only need to use the **dot1x authentication-method eap** command to enable EAP relay.

EAP termination

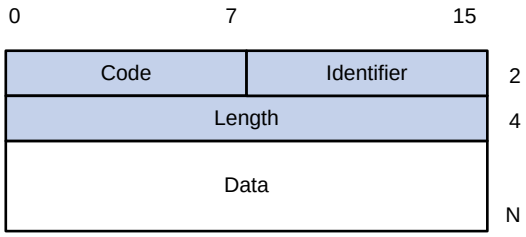
As shown in Figure 4, the access device performs the following operations in EAP termination mode:

1. Terminates the EAP packets received from the client.
2. Encapsulates the client authentication information in standard RADIUS packets.
3. Uses PAP or CHAP to authenticate to the RADIUS server.

Figure 4 EAP termination

Comparing EAP relay and EAP termination

Packet exchange method	Benefits	Limitations
EAP relay	• Supports various EAP authentication methods. • The configuration and processing are simple on the access device.	The RADIUS server must support the EAP-Message and Message-Authenticator attributes, and the EAP authentication method used by the client.



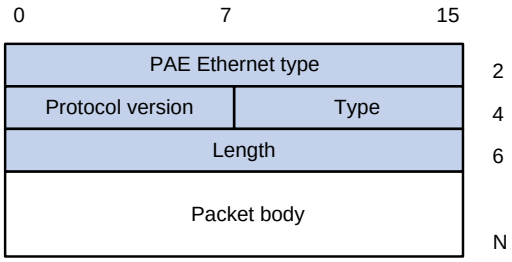
EAP termination	Works with any RADIUS server that supports PAP or CHAP authentication.	• Supports only the following EAP authentication methods:
		  ○ MD5-Challenge EAP authentication.
		  ○ The username and password EAP authentication initiated by an iNode 802.1X client.
		• The processing is complex on the access device.

Packet formats

EAP packet format

Figure 5 shows the EAP packet format.

Figure 5 EAP packet format



- **Code**—Type of the EAP packet. Options include Request (1), Response (2), Success (3), or Failure (4).
- **Identifier**—Used for matching Responses with Requests.
- **Length**—Length (in bytes) of the EAP packet. The EAP packet length is the sum of the Code, Identifier, Length, and Data fields.
- **Data**—Content of the EAP packet. This field appears only in a Request or Response EAP packet. The **Data** field contains the request type (or the response type) and the type data. Type 1 (Identity) and type 4 (MD5-Challenge) are two examples for the type field.

EAPOL packet format

Figure 6 shows the EAPOL packet format.

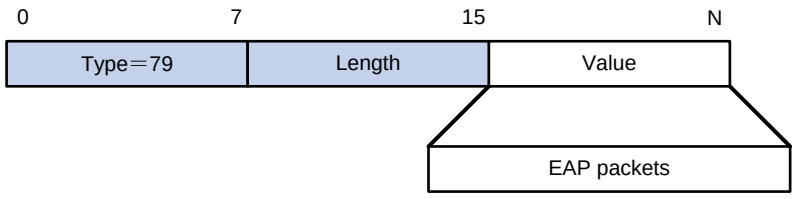
Figure 6 EAPOL packet format

- **PAE Ethernet type**—Protocol type. It takes the value 0x888E for EAPOL.
- **Protocol version**—The EAPOL protocol version used by the EAPOL packet sender.
- **Type**—Type of the EAPOL packet. Table 1 lists the types of EAPOL packets supported by the 802.1X implementation of the device.

  Table 1 Types of EAPOL packets

Value	Type	Description
0x00	EAP-Packet	The client and the access device uses EAP-Packets to transport authentication information.
0x01	EAPOL-Start	The client sends an EAPOL-Start message to initiate 802.1X authentication to the access device.
0x02	EAPOL-Logoff	The client sends an EAPOL-Logoff message to tell the access device that the client is logging off.

- **Length**—Data length in bytes, or length of the Packet body. If packet type is EAPOL-Start or EAPOL-Logoff, this field is set to 0, and no Packet body field follows.
- **Packet body**—Content of the packet. When the EAPOL packet type is EAP-Packet, the Packet body field contains an EAP packet.



EAP over RADIUS

RADIUS adds two attributes, EAP-Message and Message-Authenticator, for supporting EAP authentication. For the RADIUS packet format, see "Configuring AAA."

- EAP-Message.

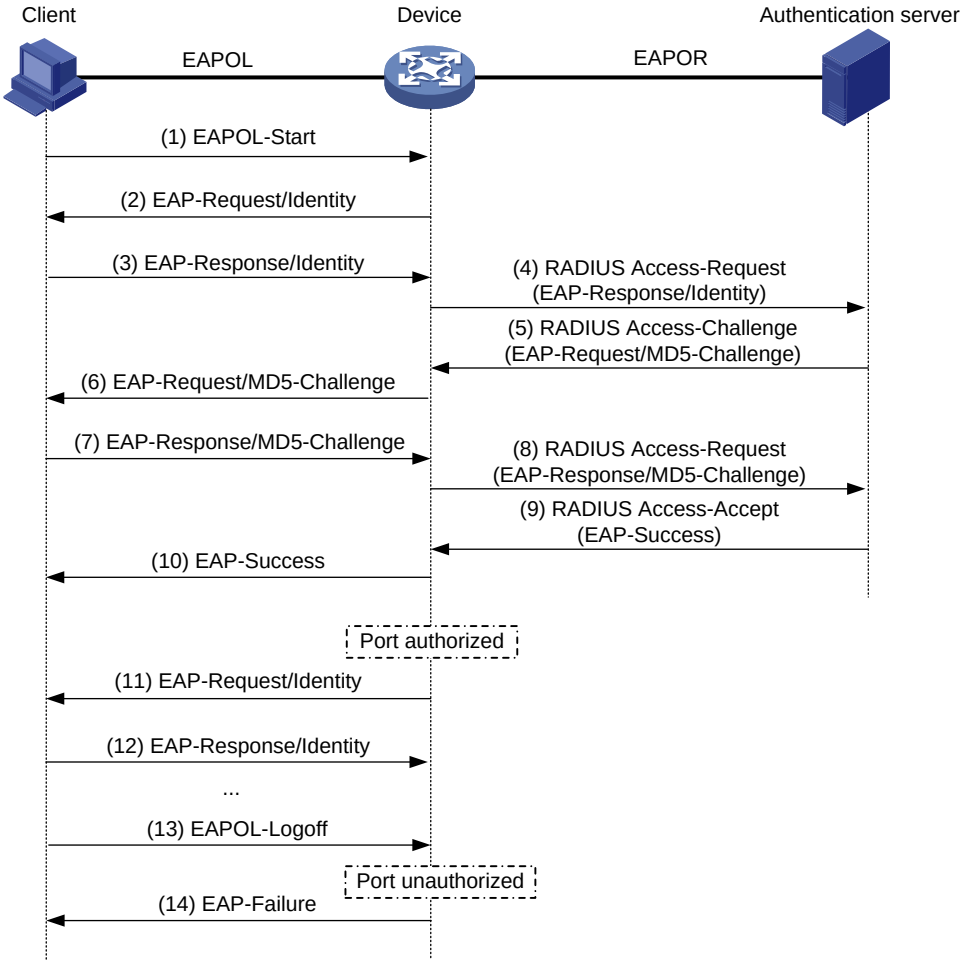
  RADIUS encapsulates EAP packets in the EAP-Message attribute, as shown in Figure 7. The Type field takes 79, and the Value field can be up to 253 bytes. If an EAP packet is longer than 253 bytes, RADIUS encapsulates it in multiple EAP-Message attributes.

  Figure 7 EAP-Message attribute format

- Message-Authenticator.

  As shown in Figure 8, RADIUS includes the Message-Authenticator attribute in all packets that have an EAP-Message attribute to check their integrity. The packet receiver drops the packet if the calculated packet integrity checksum is different from the Message-Authenticator attribute value. The Message-Authenticator prevents EAP authentication packets from being tampered with during EAP authentication.

Figure 8 Message-Authenticator attribute format



802.1X authentication procedures

802.1X authentication has two methods: EAP relay and EAP termination. You choose either mode depending on support of the RADIUS server for EAP packets and EAP authentication methods.

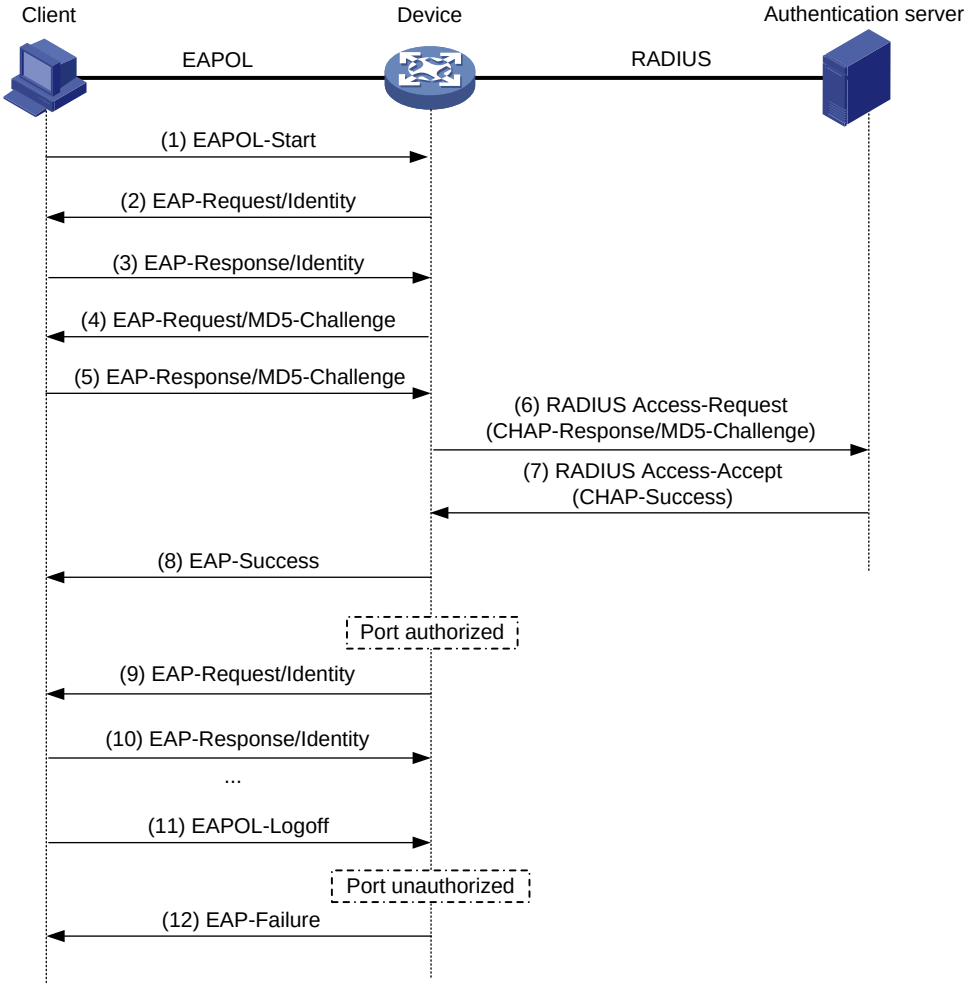
EAP relay

Figure 9 shows the basic 802.1X authentication procedure in EAP relay mode, assuming that MD5-Challenge EAP authentication is used.

Figure 9 802.1X authentication procedure in EAP relay mode

The following steps describe the 802.1X authentication procedure:

1. When a user launches the 802.1X client and enters a registered username and password, the 802.1X client sends an EAPOL-Start packet to the access device.
2. The access device responds with an EAP-Request/Identity packet to ask for the client username.
3. In response to the EAP-Request/Identity packet, the client sends the username in an EAP-Response/Identity packet to the access device.



4. The access device relays the EAP-Response/Identity packet in a RADIUS Access-Request packet to the authentication server.
5. The authentication server uses the identity information in the RADIUS Access-Request to search its user database. If a matching entry is found, the server uses a randomly generated challenge (EAP-Request/MD5-Challenge) to encrypt the password in the entry. Then, the server sends the challenge in a RADIUS Access-Challenge packet to the access device.
6. The access device transmits the EAP-Request/MD5-Challenge packet to the client.
7. The client uses the received challenge to encrypt the password, and sends the encrypted password in an EAP-Response/MD5-Challenge packet to the access device.
8. The access device relays the EAP-Response/MD5-Challenge packet in a RADIUS Access-Request packet to the authentication server.
9. The authentication server compares the received encrypted password with the encrypted password it generated at step 5. If the two passwords are identical, the server considers the client valid and sends a RADIUS Access-Accept packet to the access device.
10. Upon receiving the RADIUS Access-Accept packet, the access device performs the following operations:
    a. Sends an EAP-Success packet to the client.
    b. Sets the controlled port in authorized state.

    The client can access the network.
11. After the client comes online, the access device periodically sends handshake requests to check whether the client is still online. By default, if two consecutive handshake attempts fail, the device logs off the client.
12. Upon receiving a handshake request, the client returns a response. If the client fails to return a response after a number of consecutive handshake attempts (two by default), the access device logs off the client. This handshake mechanism enables timely release of the network resources used by 802.1X users that have abnormally gone offline.
13. The client can also send an EAPOL-Logoff packet to ask the access device for a logoff.
14. In response to the EAPOL-Logoff packet, the access device changes the status of the controlled port from authorized to unauthorized. Then, the access device sends an EAP-Failure packet to the client.

EAP termination

Figure 10 shows the basic 802.1X authentication procedure in EAP termination mode, assuming that CHAP authentication is used.

Figure 10 802.1X authentication procedure in EAP termination mode

In EAP termination mode, the access device rather than the authentication server generates an MD5 challenge for password encryption. The access device then sends the MD5 challenge together with the username and encrypted password in a standard RADIUS packet to the RADIUS server.

802.1X authentication initiation

Both the 802.1X client and the access device can initiate 802.1X authentication.

802.1X client as the initiator

The client sends an EAPOL-Start packet to the access device to initiate 802.1X authentication. The destination MAC address of the packet is the IEEE 802.1X specified multicast address 01-80-C2-00-00-03 or the broadcast MAC address. If any intermediate device between the client and the authentication server does not support the multicast address, you must use an 802.1X client that can send broadcast EAPOL-Start packets. For example, you can use the iNode 802.1X client.

Access device as the initiator

If the client cannot send EAPOL-Start packets, configure the access device to initiate authentication.

The access device supports the following modes:

- **Multicast trigger mode**—The access device multicasts EAP-Request/Identity packets to initiate 802.1X authentication at the identity request interval.

- **Unicast trigger mode**—Upon receiving a frame from an unknown MAC address, the access device sends an EAP-Request/Identity packet out of the receiving port to the MAC address. The device retransmits the packet if no response has been received within the identity request timeout interval. This process continues until the maximum number of request attempts set by using the **`dot1x retry`** command is reached.

The username request timeout timer sets both the identity request interval for the multicast trigger and the identity request timeout interval for the unicast trigger.

Access control methods

The device implements port-based access control as defined in the 802.1X protocol, and extends the protocol to support MAC-based access control.

- **Port-based access control**—Once an 802.1X user passes authentication on a port, any subsequent user can access the network through the port without authentication. When the authenticated user logs off, all other users are logged off.
- **MAC-based access control**—Each user is separately authenticated on a port. When a user logs off, no other online users are affected.

802.1X VLAN manipulation

Authorization VLAN

The authorization VLAN controls the access of an 802.1X user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port that performs port-based access control.

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.
- Private VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 2.

Table 2 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection

VLANs by IDs
VLANs by names
VLAN group name
	If the 802.1X-enabled port performs MAC-based access control, the device selects an authorization VLAN from the VLAN group for a user according to the following rules:
	• On a hybrid port with MAC-based VLAN enabled:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online 802.1X users, the device selects the VLAN with the lower ID.
	• On an access, trunk, or MAC-based VLAN disabled hybrid port:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails.
	If the 802.1X-enabled port performs port-based access control, the device selects the VLAN with the lowest ID from the VLAN group. All subsequent 802.1X users are assigned to that VLAN.

VLAN IDs with suffixes	**1.** The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. **2.** The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on an 802.1X-enabled port

Table 3 describes how the access device handles VLANs (except for the VLANs specified with suffixes) on an 802.1X-enabled port.

Table 3 VLAN manipulation

Port access control method		VLAN manipulation
Port-based		The device assigns the port to the first authenticated user's authorization VLAN. All subsequent 802.1X users can access the VLAN without authentication. If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN as an untagged member and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN as a tagged member without changing the PVID. **NOTE:** The tagged attribute is supported only on trunk and hybrid ports.
MAC-based	Access port	**IMPORTANT:** Make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute. The device assigns the port to the authorization VLAN assigned to the first user that passes authentication.
	Trunk port	If the authorization VLANs have the tagged attribute, the device maps the MAC address of each user to its own authorization VLAN without changing the PVID of the port. If the authorization VLANs have the untagged attribute, the device sets the first authenticated user's authorization VLAN as the PVID of the port.
	Hybrid port	If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN as a tagged member without changing the PVID. You can authorize a tagged VLAN to only one user. If the authorization VLAN has the untagged attribute, the device performs the following operations: • Assigns the port to the authorization VLAN as an untagged member. • If MAC-based VLAN is enabled, dynamically creates MAC address and VLAN mappings without changing the PVID of the port. • If MAC-based VLAN is disabled, the device sets the first authenticated user's authorization VLAN as the PVID of the port.

IMPORTANT:

- When you assign VLANs to users attached to an access port, trunk port, or MAC-based VLAN disabled hybrid port, make sure there is only one untagged VLAN. If a different untagged VLAN is assigned to a subsequent user, the user cannot pass authentication.
- As a best practice to enhance network security, do not use the **`port hybrid vlan`** command to assign a hybrid port to an authorization VLAN as a tagged member.

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **port hybrid vlan tagged** command. Then, the VLAN has the tagged attribute on the port.

For an 802.1X authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **port hybrid vlan** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **port hybrid vlan** command to configure the port as an untagged member in the VLAN.

On a port with periodic online user reauthentication enabled, the MAC-based VLAN feature does not take effect on a user that has been online since before this feature was enabled. The access device creates a MAC-to-VLAN mapping for the user when the following requirements are met:

- The user passes reauthentication.
- The authorization VLAN for the user is changed.

For more information about VLAN configuration and MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Guest VLAN

The 802.1X guest VLAN on a port accommodates users that have not performed 802.1X authentication. Users in the guest VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches. Once a user in the guest VLAN passes 802.1X authentication, it is removed from the guest VLAN and can access authorized network resources.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port when the port is in auto state.	The device assigns the port to the 802.1X guest VLAN. All 802.1X users on this port can access only resources in the guest VLAN. The guest VLAN assignment varies by port link mode. For more information, see Table 3 in "Authorization VLAN."
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device assigns the port to the Auth-Fail VLAN. All users on this port can access only resources in the Auth-Fail VLAN. If no Auth-Fail VLAN is configured, the port is still in the 802.1X guest VLAN. All users on the port are in the guest VLAN. For information about the 802.1X Auth-Fail VLAN, see "Auth-Fail VLAN."

Authentication status	VLAN manipulation
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device removes the port from the 802.1X guest VLAN and assigns the port to the authorization VLAN of the user. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial port VLAN. After the user logs off, the port is assigned to the guest VLAN again. **NOTE:** The initial PVID of an 802.1X-enabled port refers to the PVID used by the port before the port is assigned to any 802.1X VLANs.

IMPORTANT:

When the port receives a packet with a VLAN tag, the packet will be forwarded within the tagged VLAN if the VLAN is not the guest VLAN.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port and has not performed 802.1X authentication.	The device creates a mapping between the MAC address of the user and the 802.1X guest VLAN. The user can access only resources in the guest VLAN.
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device remaps the MAC address of the user to the Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the user is removed from the guest VLAN and added to the initial PVID.
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Auth-Fail VLAN

The 802.1X Auth-Fail VLAN on a port accommodates users that have failed 802.1X authentication because of the failure to comply with the organization's security policy. For example, the VLAN accommodates users that have entered a wrong password. Users in the Auth-Fail VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device assigns the port to the Auth-Fail VLAN. All 802.1X users on this port can access only resources in the Auth-Fail VLAN. The Auth-Fail VLAN assignment varies by port link mode. For more information, see Table 3 in "Authorization VLAN."

Authentication status	VLAN manipulation
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The port is still in the Auth-Fail VLAN, and all 802.1X users on this port are in this VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the Auth-Fail VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial PVID. After the user logs off, the port is assigned to the guest VLAN. If no guest VLAN is configured, the port is assigned to the initial PVID of the port.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device maps the MAC address of the user to the 802.1X Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The user is still in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Critical VLAN

The 802.1X critical VLAN on a port accommodates 802.1X users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable. Users in the critical VLAN can access a limited set of network resources depending on the configuration.

The critical VLAN feature takes effect when 802.1X authentication is performed only through RADIUS servers. If an 802.1X user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable.	The device assigns the port to the critical VLAN. The 802.1X user and all subsequent 802.1X users on this port can access only resources in the 802.1X critical VLAN. The critical VLAN assignment varies by port link mode. For more information, see Table 3 in "Authorization VLAN."

Authentication status	VLAN manipulation
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The port is still in the critical VLAN.
A user in the 802.1X critical VLAN fails authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the port is assigned to the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the port is assigned to the initial PVID of the port.
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the 802.1X critical VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to this port VLAN. After the user logs off, the port is assigned to the guest VLAN. If no 802.1X guest VLAN is configured, the initial PVID of the port is restored.
A user in the 802.1X guest VLAN fails authentication because all the RADIUS servers are unreachable.	The device assigns the port to the 802.1X critical VLAN, and all 802.1X users on this port are in this VLAN.
A user in the 802.1X Auth-Fail VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the 802.1X Auth-Fail VLAN.
A user that has passed authentication fails reauthentication because all the RADIUS servers are unreachable, and the user is logged out of the device.	The device assigns the port to the 802.1X critical VLAN.

If the port is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the port from the critical VLAN.
2. Sends a multicast EAP-Request/Identity message out of the port to trigger authentication.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the 802.1X critical VLAN. The user can access only resources in the 802.1X critical VLAN.
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The user is still in the critical VLAN.
A user in the 802.1X critical VLAN fails 802.1X authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the Auth-Fail VLAN ID. If no 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the initial PVID.

Authentication status	VLAN manipulation
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN to the user, the device remaps the MAC address of the user to the initial PVID on the port.
A user in the 802.1X guest VLAN fails authentication because all the RADIUS servers are unreachable.	The device remaps the MAC address of the user to the 802.1X critical VLAN. The user can access only resources in the 802.1X critical VLAN.
A user in the 802.1X Auth-Fail VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the 802.1X Auth-Fail VLAN.

If a user is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the user from the critical VLAN.
2. Sends a unicast EAP-Request/Identity message out of the port to the user for reauthentication.

Critical voice VLAN

The 802.1X critical voice VLAN on a port accommodates 802.1X voice users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable.

The critical voice VLAN feature takes effect when 802.1X authentication is performed only through RADIUS servers. If an 802.1X voice user fails local authentication after RADIUS authentication, the voice user is not assigned to the critical voice VLAN. For more information about the authentication methods, see "Configuring AAA."

When a reachable RADIUS server is detected, the device performs operations on a port based on its 802.1X access control method.

Port-based access control

When a reachable RADIUS server is detected, the device removes the port from the critical voice VLAN. The port sends a multicast EAP-Request/Identity packet to all 802.1X voice users on the port to trigger authentication.

MAC-based access control

When a reachable RADIUS server is detected, the device removes 802.1X voice users from the critical voice VLAN. The port sends a unicast EAP-Request/Identity packet to each 802.1X voice user that was assigned to the critical voice VLAN to trigger authentication.

ACL assignment

You can specify an authorization ACL for an 802.1X user on a remote server or the access device to control the user's access to network resources. After the user passes 802.1X authentication, the server or access device assigns the authorization ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules in the ACL.

The device supports assignment of static and dynamic authorization ACLs.

- **Assignment of static authorization ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, you can use one of the following methods:

- Modify ACL rules in the authorization ACL on the access device.
- Assign another ACL to the user as the authorization ACL from the RADIUS server or the access device.

Static ACLs and their rules can be manually deleted from the access device.

- **Assignment of dynamic authorization ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device. Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

  If the dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

  A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

  Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **`display dot1x connection`** or **`display acl`** command.

IMPORTANT:

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.
- User-defined ACLs, which are numbered in the range of 5000 to 5999.

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword.

For more information about ACLs, see *ACL and QoS Command Reference*.

User profile assignment

You can specify a user profile for an 802.1X user on the authentication server to control the user's access to network resources. After the user passes 802.1X authentication, the authentication server assigns the user profile to the user for filtering traffic.

The authentication server can be the local access device or a RADIUS server. In either case, the server only specifies the user profile name. You must configure the user profile on the access device.

To change the user's access permissions, use one of the following methods:

- Modify the user profile configuration on the access device.
- Specify another user profile for the user on the authentication server.

For more information about user profiles, see "Configuring user profiles."

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server when the 802.1X-enabled port performs MAC-based access control and the port authorization state is **auto**. During authentication, the HTTP or HTTPS requests of an 802.1X user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the user and uses a DM (Disconnect Message) to log off the user. When the user initiates 802.1X authentication again, it will pass the authentication and come online successfully.

This feature is mutually exclusive with the EAD assistant feature.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Periodic 802.1X reauthentication

Periodic 802.1X reauthentication tracks the connection status of online users and updates the authorization attributes (such as ACL and VLAN) assigned by the server.

The device reauthenticates online 802.1X users at the periodic reauthentication interval when the periodic online user reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online users only after the old timer expires and the users pass authentication.

The server-assigned session timeout timer (Session-Timeout attribute) and termination action (Termination-Action attribute) together can affect the periodic online user reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **`display dot1x connection`** command (see *Security Command Reference*).

- If the termination action is **Default** (logoff), periodic online user reauthentication on the device takes effect only when the periodic reauthentication timer is shorter than the session timeout timer.
- If the termination action is **Radius-request**, the periodic online user reauthentication settings on the device do not take effect. The device reauthenticates the online 802.1X users after the session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic 802.1X reauthentication depends on the periodic reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether 802.1X periodic reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online 802.1X users if no server is reachable for 802.1X reauthentication. The keep-online feature keeps authenticated 802.1X users online when no server is reachable for 802.1X reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

EAD assistant

Endpoint Admission Defense (EAD) is an integrated endpoint access control solution to improve the threat defensive capability of a network. The solution enables the security client, security policy server, access device, and third-party server to operate together. If a terminal device seeks to access an EAD network, it must have an EAD client, which performs 802.1X authentication.

The EAD assistant feature allows unauthenticated users to access freely accessible network segments and enables the access device to redirect the HTTP or HTTPS requests of users to a redirect URL for downloading and installing EAD clients. This feature eliminates the administrative task to deploy EAD clients.

EAD assistant is implemented by the following functionality:

- Free IP.

  A free IP is a freely accessible network segment, which has a limited set of network resources such as software and DHCP servers. To ensure security policy compliance, an unauthenticated

user can access only this segment to perform operations. For example, the user can download EAD client from a software server or obtain a dynamic IP address from a DHCP server.

- Redirect URL.

  If an unauthenticated 802.1X user is using a Web browser to access the network, EAD assistant redirects the network access requests of the user to a specific URL. For example, you can use this feature to redirect the user to the EAD client software download page.

The EAD assistant feature creates an ACL-based EAD rule automatically to open access to the free segment for each unauthenticated user.

EAD rules are implemented by using ACL resources. When the EAD rule timer expires or the user passes authentication, the rule is removed. If users fail to download EAD client or fail to pass authentication before the timer expires, they must reconnect to the network to access the free segment.

Configuring 802.1X

Restrictions and guidelines: 802.1X configuration

You can configure the port security feature to perform 802.1X. Port security combines and extends 802.1X and MAC authentication. It applies to a network (a WLAN, for example) that requires different authentication methods for different users on a port. For more information about the port security feature, see "Configuring port security."

When you configure 802.1X settings on an interface, follow these restrictions and guidelines:

- 802.1X is supported only on Layer 2 Ethernet interfaces that do not belong to an aggregation group.
- Do not change the link type of a port when the 802.1X guest VLAN, Auth-Fail VLAN, or critical VLAN on the port has users.

802.1X tasks at a glance

To configure 802.1X authentication, perform the following tasks:

1. Enabling 802.1X
2. Configuring basic 802.1X features
   - Enabling EAP relay or EAP termination
   - Setting the port authorization state
   - Specifying an access control method
   - (Optional.) Specifying a mandatory authentication domain on a port
   - (Optional.) Setting the 802.1X authentication timeout timers
   - (Optional.) Configuring 802.1X reauthentication
   - (Optional.) Setting the quiet timer
3. (Optional.) Configuring 802.1X VLAN assignment
   - Configuring an 802.1X guest VLAN
   - Enabling 802.1X guest VLAN assignment delay
   - Configuring an 802.1X Auth-Fail VLAN
   - Configuring an 802.1X critical VLAN
   - Enabling the 802.1X critical voice VLAN feature
4. (Optional.) Configuring an 802.1X access profile
5. (Optional.) Setting the upper limit for 802.1X parameters
   - Setting the maximum number of concurrent 802.1X users on a port
   - Setting the alarm threshold and alarm clear threshold for 802.1X user access ratio
   - Setting the maximum number of authentication request attempts
   - Setting the maximum number of 802.1X authentication attempts for MAC authenticated users
6. (Optional.) Configuring other 802.1X features
   - Configuring 802.1X unauthenticated user aging
   - Sending EAP-Success packets on assignment of users to the 802.1X Auth-Fail VLAN
   - Sending EAP-Success packets on assignment of users to the 802.1X critical VLAN
   - Enabling 802.1X online user synchronization

- Configuring the authentication trigger feature

  Perform this task when 802.1X clients cannot initiate authentication.
- Sending EAP-Success packets to 802.1X clients after successful authorization
- Discarding duplicate 802.1X EAPOL-Start requests
- Configuring online user handshake
- Configuring packet detection for 802.1X authentication
- Enabling online 802.1X users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available
- Specifying supported domain name delimiters
- Removing the VLAN tags of 802.1X protocol packets sent out of a port
- Enabling 802.1X user IP freezing
- Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users
- Configuring 802.1X MAC address binding
- Configuring the EAD assistant feature
- Setting the maximum size of EAP-TLS fragments sent to the server

  Use this feature to reduce the size of authentication packets sent to the server when the device uses EAP-TLS authentication method in EAP relay mode.
- Setting the unicast-trigger quiet timer
- Logging off 802.1X users
- Enabling 802.1X user logging
- Configuring SNMP notifications for 802.1X

Prerequisites for 802.1X

Before you configure 802.1X, complete the following tasks:

- Configure an ISP domain and AAA scheme (local or RADIUS authentication) for 802.1X users.
- If RADIUS authentication is used, create user accounts on the RADIUS server.
- If local authentication is used, create local user accounts on the access device and set the service type to **lan-access**.

Enabling 802.1X

Restrictions and guidelines

For 802.1X to take effect on a port, you must enable it both globally and on the port.

If the PVID is a voice VLAN, the 802.1X feature cannot take effect on the port. For more information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`
2. Enable 802.1X globally.

   `dot1x`

   By default, 802.1X is disabled globally.
3. Enter interface view.

   `interface` *`interface-type interface-number`*

4. Enable 802.1X on a port.

   dot1x

   By default, 802.1X is disabled on a port.

Enabling EAP relay or EAP termination

About this task

Consider the following factors to select a proper EAP mode:

- Support of the RADIUS server for EAP packets.
- Authentication methods supported by the 802.1X client and the RADIUS server.

Restrictions and guidelines

- If EAP relay mode is used, the **user-name-format** command configured in RADIUS scheme view does not take effect. The access device sends the authentication data from the client to the server without any modification. For more information about the **user-name-format** command, see *Security Command Reference*.
- You can use both EAP termination and EAP relay in any of the following situations:
  - The client is using only MD5-Challenge EAP authentication. If EAP termination is used, you must enable CHAP authentication on the access device.
  - The client is an iNode 802.1X client and initiates only the username and password EAP authentication. If EAP termination is used, you can enable either PAP or CHAP authentication on the access device. However, for the purpose of security, you must use CHAP authentication on the access device.
- To use EAP-TLS, PEAP, or any other EAP authentication methods, you must use EAP relay. When you make your decision, see "Comparing EAP relay and EAP termination" for help.

Procedure

1. Enter system view.

   system-view

2. Configure EAP relay or EAP termination.

   dot1x authentication-method { **chap** | **eap** | **pap** }

   By default, the access device performs EAP termination and uses CHAP to communicate with the RADIUS server.

Setting the port authorization state

About this task

The port authorization state determines whether the client is granted access to the network. You can control the following authorization states of a port:

- **Authorized**—Places the port in the authorized state, enabling users on the port to access the network without authentication.
- **Unauthorized**—Places the port in the unauthorized state, denying any access requests from users on the port.
- **Auto**—Places the port initially in unauthorized state to allow only EAPOL packets to pass. After a user passes authentication, sets the port in the authorized state to allow access to the network. You can use this option in most scenarios.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port authorization state.
   dot1x port-control { **authorized-force** | **auto** | **unauthorized-force** }
   By default, the **auto** state applies.

Specifying an access control method

About this task

The device supports port-based and MAC-based access control methods.

Restrictions and guidelines

If online 802.1X users are present on a port, changing its access control method will cause the online users to go offline.

To avoid authentication anomalies, do not execute the **dot1x port-method portbased** command on an interface that is bound to a port security authentication profile.

To avoid feature conflicts, do not use 802.1X port-based access control in conjunction with MAC authentication, Web authentication, or static user authentication.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an access control method.
   dot1x port-method { **macbased** | **portbased** }
   By default, MAC-based access control applies.

Specifying a mandatory authentication domain on a port

About this task

You can place all 802.1X users in a mandatory authentication domain for authentication, authorization, and accounting on a port. No user can use an account in any other domain to access the network through the port. The implementation of a mandatory authentication domain enhances the flexibility of 802.1X access control deployment.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a mandatory 802.1X authentication domain on the port.
   dot1x mandatory-domain *domain-name*
   By default, no mandatory 802.1X authentication domain is specified.

Setting the 802.1X authentication timeout timers

About this task

The network device uses the following 802.1X authentication timeout timers:

- **Client timeout timer**—Starts when the access device sends an EAP-Request/MD5-Challenge packet to a client. If no response is received when this timer expires, the access device retransmits the request to the client.
- **Server timeout timer**—Starts when the access device sends a RADIUS Access-Request packet to the authentication server. If no response is received when this timer expires, the 802.1X authentication fails.

Restrictions and guidelines

In most cases, the default settings are sufficient. You can edit the timers, depending on the network conditions.

- In a low-speed network, increase the client timeout timer.
- In a network with authentication servers of different performance, adjust the server timeout timer.

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Set the client timeout timer.
   dot1x timer supp-timeout *supp-timeout-value*
   The default is 30 seconds.
3. Set the server timeout timer.
   dot1x timer server-timeout *server-timeout-value*
   The default is 100 seconds.

Configuring 802.1X reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for 802.1X reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

After you perform a manual reauthentication, the device reauthenticates all online 802.1X users on a port regardless of the server-assigned reauthentication attribute and the periodic reauthentication feature on the port.

Modification to the mandatory authentication domain or EAP message handling method setting does not affect the reauthentication of online 802.1X users. The modified setting takes effect only on 802.1X users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view
2. Set the periodic reauthentication timer.
   - Set a global periodic reauthentication timer.

     dot1x timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.
   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     dot1x timer reauth-period *reauth-period-value*

     quit

     By default, no periodic reauthentication timer is set on a port. The port uses the global 802.1X periodic reauthentication timer.
3. Enter interface view.

   interface *interface-type interface-number*
4. Enable periodic online user reauthentication.

   dot1x re-authenticate

   By default, the feature is disabled.
5. (Optional.) Manually reauthenticate all online 802.1X users on the port.

   dot1x re-authenticate manual
6. (Optional.) Enable the keep-online feature for 802.1X users.

   dot1x re-authenticate server-unreachable keep-online

   By default, this feature is disabled. The device logs off online 802.1X users if no authentication server is reachable for 802.1X reauthentication.

   Use the keep-online feature according to the actual network condition. In a fast-recovery network, you can use the keep-online feature to prevent 802.1X users from coming online and going offline frequently.

Setting the quiet timer

About this task

The quiet timer enables the access device to wait a period of time before it can process any authentication request from a client that has failed an 802.1X authentication.

Restrictions and guidelines

You can edit the quiet timer, depending on the network conditions.

- In a vulnerable network, set the quiet timer to a high value.

- In a high-performance network with quick authentication response, set the quiet timer to a low value.

Procedure

1. Enter system view.
   system-view
2. Enable the quiet timer.
   dot1x quiet-period
   By default, the timer is disabled.
3. Set the quiet timer.
   dot1x timer quiet-period *quiet-period-value*
   The default is 60 seconds.

Configuring an 802.1X guest VLAN

Restrictions and guidelines

- You can configure only one 802.1X guest VLAN on a port. The 802.1X guest VLANs on different ports can be different.
- Assign different IDs to the port VLAN, the voice VLAN, and the 802.1X guest VLAN on a port. The assignment makes sure the port can correctly process incoming VLAN-tagged traffic.
- For the 802.1X guest VLAN feature to work correctly, do not configure this feature together with EAD assistant.
- If the port type is hybrid, verify that the VLAN to be specified as the guest VLAN is not in the tagged VLAN list on the port. If the guest VLAN is tagged, you must make it untagged, and then reconfigure it as the guest VLAN.
- To have a VLAN act as the 802.1X guest VLAN for a port, make sure that VLAN is not specified as a free VLAN for port security.
- If a voice VLAN and an 802.1X guest VLAN are both configured on a hybrid port, the voice VLAN has higher priority than the 802.1X guest VLAN. A packet is forwarded out of the voice VLAN if it matches the voice VLAN settings. If it does not match the voice VLAN settings, its source MAC address might be added to the 802.1X guest VLAN.
- When you configure multiple security features on a port, follow the guidelines in Table 4.

Table 4 Relationships of the 802.1X guest VLAN and other security features

Feature	Relationship description	Reference
802.1X Auth-Fail VLAN on a port that performs MAC-based access control	The 802.1X Auth-Fail VLAN has a higher priority than the 802.1X guest VLAN.	See "802.1X VLAN manipulation."
Port intrusion protection actions on a port that performs MAC-based access control	The 802.1X guest VLAN feature has higher priority than the block MAC action. The 802.1X guest VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure an 802.1X guest VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X guest VLAN.

- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the guest VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the 802.1X guest VLAN on the port.

   dot1x guest-vlan *guest-vlan-id*

   By default, no 802.1X guest VLAN exists on a port.

Enabling 802.1X guest VLAN assignment delay

About this task

This feature delays assigning an 802.1X-enabled port to the 802.1X guest VLAN when 802.1X authentication is triggered on the port.

This feature applies only to situations where 802.1X authentication is triggered by EAPOL-Start packets from 802.1X clients or packets from unknown MAC addresses.

To use this feature, the 802.1X-enabled port must perform MAC-based access control. To use the new MAC-triggered 802.1X guest VLAN assignment delay, you must also configure 802.1X unicast trigger on the port.

When 802.1X authentication is triggered on a port, the device performs the following operations:

1. Sends a unicast EAP-Request/Identity packet to the MAC address that triggers the authentication.
2. Retransmits the packet if no response is received within the username request timeout interval set by using the **dot1x timer tx-period** command.
3. Assigns the port to the 802.1X guest VLAN after the maximum number of request attempts set by using the **dot1x retry** command is reached.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable 802.1X guest VLAN assignment delay on the port.

   dot1x guest-vlan-delay { **eapol** | **new-mac** }

   By default, 802.1X guest VLAN assignment delay is disabled on a port.

Configuring an 802.1X Auth-Fail VLAN

Restrictions and guidelines

- Assign different IDs to the port VLAN, the voice VLAN, and the 802.1X Auth-Fail VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.
- You can configure only one 802.1X Auth-Fail VLAN on a port. The 802.1X Auth-Fail VLANs on different ports can be different.
- On a hybrid port, the Auth-Fail VLAN can only be an untagged VLAN.
- To have a VLAN act as the 802.1X Auth-Fail VLAN for a port, make sure that VLAN is not specified as a free VLAN for port security.
- When you configure multiple security features on a port, follow the following guidelines:
  - On a port that performs MAC-based access control, the 802.1X Auth-Fail VLAN has a high priority over the MAC authentication guest VLAN. For more information about MAC authentication, see "Configuring MAC authentication."
  - For port intrusion protection actions on a port that performs MAC-based access control: The 802.1X Auth-Fail VLAN feature has higher priority than the block MAC action. The 802.1X Auth-Fail VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.

    For more information about port security, see "Configuring port security."

Prerequisites

Before you configure an 802.1X Auth-Fail VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X Auth-Fail VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the Auth-Fail VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the 802.1X Auth-Fail VLAN on the port.

   dot1x auth-fail vlan *authfail-vlan-id*

   By default, no 802.1X Auth-Fail VLAN exists on a port.

Configuring an 802.1X critical VLAN

Restrictions and guidelines

- Assign different IDs to the PVID, the voice VLAN, and the 802.1X critical VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.
- You can configure only one 802.1X critical VLAN on a port. The 802.1X critical VLANs on different ports can be different.

- On a hybrid port, the critical VLAN can only be an untagged VLAN.
- To have a VLAN act as the 802.1X critical VLAN for a port, make sure that VLAN is not specified as a free VLAN for port security.

Prerequisites

Before you configure an 802.1X critical VLAN, complete the following tasks:

- Create the VLAN to be specified as a critical VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the critical VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the 802.1X critical VLAN on the port.
   dot1x critical vlan *critical-vlan-id*
   By default, no 802.1X critical VLAN exists on a port.

Enabling the 802.1X critical voice VLAN feature

Restrictions and guidelines

The feature does not take effect if the voice user has been in the 802.1X Auth-Fail VLAN.

Prerequisites

Before you enable the 802.1X critical voice VLAN feature on a port, complete the following tasks:

- Enable LLDP both globally and on the port.
  The device uses LLDP to identify voice users. For information about LLDP, see *Layer 2—LAN Switching Configuration Guide*.
- Enable voice VLAN on the port.
  For information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- Specify an 802.1X critical VLAN on the port. This setting ensures that a voice user is assigned to the critical VLAN if it has failed authentication for unreachability of RADIUS servers before the device recognizes it as a voice user. If an 802.1X critical VLAN is not available, the voice user might be logged off instead.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the 802.1X critical voice VLAN feature on a port.
   dot1x critical-voice-vlan

By default, the 802.1X critical voice VLAN feature is disabled on a port.

Configuring an 802.1X access profile

About this task

The device uses 802.1X access profiles to manage 802.1X access settings in a unified manner. After you bind an 802.1X access profile to a port security authentication profile, the interfaces to which the port security authentication profile is applied will use the settings in the 802.1X access profile to authenticate access users.

After you bind a port security authentication profile to an interface:

- For settings that can be configured both in interface view and 802.1X access profile view (the command lines might differ in the views), the system automatically deletes the settings in interface view regardless of whether the port security authentication profile has been bound to an 802.1X access profile. To use these settings, configure them in the 802.1X access profile bound to the port security authentication profile.
- For settings that can be configured in interface view but cannot be configured in 802.1X access profile view, they can still take effect after you apply an 802.1X access profile to that interface.

For more information about port security authentication profiles, see "Configuring port security."

Restrictions and guidelines

Deleting the 802.1X access profile bound to a port security authentication profile will cause online users to go offline abnormally if the access profile has taken effect.

An 802.1X access profile can be bound to multiple port security authentication profiles, but a port security authentication profile can bind only one 802.1X access profile. To change the 802.1X access profile bound to a port security authentication profile, you must first remove the original binding.

Procedure

1. Enter system view.

   system-view
2. Create an 802.1X access profile and enter its view.

   dot1x access-profile name *profile-name*

   By default, no 802.1X access profiles exist.
3. Configure 802.1X features in the 802.1X access profile.

   For information about the features that can be configured in an 802.1X access profile, see 802.1X commands in the command reference.
4. Enter port security authentication profile view.

   port-security authentication-profile name *profile-name*
5. Bind the 802.1X access profile to the port security authentication profile.

   dot1x access-profile *profile-name*

   By default, no 802.1X access profile is bound to a port security authentication profile.

Configuring 802.1X unauthenticated user aging

About this task

802.1X unauthenticated user aging applies to users added to an 802.1X guest, critical, or Auth-Fail VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

The 802.1X user aging mechanism on a port depends on its access control mode.

- If the port uses port-based access control, a user aging timer starts when the port is assigned to the critical or Auth-Fail VLAN. When the aging timer expires, the port is removed from the VLAN and all MAC address entries for users in the VLAN are also removed.
- If the port uses MAC-based access control, a user aging timer starts for each 802.1X user when they are assigned to the Auth-Fail, critical, or guest VLAN. When the aging timer for a user expires, the device removes that user from the VLAN.

The removed users will be unable to access any network resources until after another authentication is triggered.

Restrictions and guidelines

As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.

   system-view

2. Set the user aging timer for a type of 802.1X VLAN.

   dot1x timer user-aging { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } *aging-time-value*

   By default, the user aging timers for all applicable types of 802.1X VLANs are 1000 seconds.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable 802.1X unauthenticated user aging.

   dot1x unauthenticated-user aging enable

   By default, 802.1X unauthenticated user aging is enabled.

Sending EAP-Success packets on assignment of users to the 802.1X Auth-Fail VLAN

About this task

By default, the device sends EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X Auth-Fail VLAN on a port. However, some 802.1X clients cannot send DHCP requests for IP addresses after they receive EAP-Failure packets.

To have these clients obtain IP addresses and access resources after they are assigned to the 802.1X Auth-Fail VLAN, perform this task.

This task enables the device to send EAP-Success packets instead of EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X Auth-Fail VLAN on the port.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the device to send an EAP-Success packet to a client when the client user is assigned to the 802.1X Auth-Fail VLAN on the port.

   dot1x auth-fail eapol

   By default, the device sends an EAP-Failure packet to a client when the client user is assigned to the 802.1X Auth-Fail VLAN.

Sending EAP-Success packets on assignment of users to the 802.1X critical VLAN

About this task

By default, the device sends EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN. Some 802.1X clients cannot respond to the EAP-Request/Identity packet from the device for reauthentication if they have received an EAP-Failure packet. As a result, reauthentication for these clients will fail after the authentication server becomes reachable.

To avoid this situation, enable the device to send EAP-Success packets instead of EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the device to send an EAP-Success packet to an 802.1X client when its client user is assigned to the critical VLAN on the port.

   dot1x critical eapol

   By default, the device sends an EAP-Failure packet to an 802.1X client when its client user is assigned to the critical VLAN.

Enabling 802.1X online user synchronization

About this task

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate 802.1X users.

To ensure that the RADIUS server maintains the same online 802.1X user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online 802.1X user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online 802.1X user information on a port with the RADIUS server, the device initiates 802.1X authentication in turn for each authenticated online 802.1X user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new 802.1X users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **radius-server test-profile** command. When you configure this feature, make sure the detection interval is shorter than the RADIUS server quiet timer configured by using the **timer quiet** command in RADIUS scheme view. The server state changes to active on expiration of the quiet timer regardless of its actual reachability. Setting a shorter detection interval than the quiet timer prevents the RADIUS server status detection feature from falsely reporting the server reachability.

For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable 802.1X online user synchronization.
   dot1x server-recovery online-user-sync
   By default, 802.1X online user synchronization is disabled.

Configuring the authentication trigger feature

About this task

The authentication trigger feature enables the access device to initiate 802.1X authentication when 802.1X clients cannot initiate authentication.

This feature provides the multicast trigger and unicast trigger (see 802.1X authentication initiation in "802.1X overview").

Restrictions and guidelines

- Enable the multicast trigger on a port when the clients attached to the port cannot send EAPOL-Start packets to initiate 802.1X authentication.
- As a best practice to conserve link bandwidth, disable the multicast trigger if a lot of VLANs are configured on the port.
- Enable the unicast trigger on a port if only a few 802.1X clients are attached to the port and these clients cannot initiate authentication.
- To avoid duplicate authentication packets, do not enable both triggers on a port.
- As a best practice, do not use the unicast trigger on a port that performs port-based access control. If you do so, users on the port might fail to come online.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Set the username request timeout timer.
   dot1x timer tx-period *tx-period-value*
   The default is 30 seconds.
3. Enter interface view.

interface *interface-type interface-number*

4. Enable an authentication trigger.
   dot1x { **multicast-trigger** | **unicast-trigger** }
   By default, multicast trigger is disabled and unicast trigger is enabled.

Setting the maximum number of concurrent 802.1X users on a port

About this task

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum number of concurrent 802.1X users on a port.
   dot1x max-user [**preauth-domain** | **auth-fail-domain**] *max-number*
   The default is 4294967295.

Setting the alarm threshold and alarm clear threshold for 802.1X user access ratio

About this task

The 802.1X user access ratio on an interface is the percentage of current online 802.1X users to the maximum number of concurrent 802.1X users on the interface (configured by using the **dot1x max-user** command).

After you use the **snmp-agent trap enable dot1x** command to enable SNMP notifications for 802.1X user access ratio and use the **dot1x max-user-alarm** command to set the alarm threshold and alarm clear threshold:

- If the percentage of 802.1X user access ratio on an interface reaches the specified alarm threshold for the first time, or increases to the alarm threshold from a value below or equal to the alarm clear threshold, the device sends an alarm notification.
- If the percentage of 802.1X user access ratio on the interface drops to the alarm clear threshold from a value above or equal to the alarm threshold, the device sends an alarm clear notification.

If the user access ratio on an interface has reached or exceeded the alarm threshold before SNMP notifications is enabled, the alarm is triggered in the following conditions after SNMP notifications is enabled:

- A user comes online and the alarm threshold is exceeded.
- A user goes offline and the alarm threshold is reached or exceeded.

Procedure

1. Enter system view.
   system-view
2. Set the alarm threshold and alarm clear threshold for 802.1X user access ratio in percentage.

dot1x max-user-alarm trigger-threshold *trigger-threshold* **clear-threshold** *clear-threshold*

By default, the alarm threshold and alarm clear threshold for 802.1X user access ratio in percentage is 100 and 50, respectively.

Setting the maximum number of authentication request attempts

About this task

The access device retransmits an authentication request if it does not receive any responses to the request from the client within a period of time. To set the time, use the **dot1x timer tx-period** *tx-period-value* command or the **dot1x timer supp-timeout** *supp-timeout-value* command. The access device stops retransmitting the request if it has made the maximum number of request transmission attempts but still receives no response.

Procedure

1. Enter system view.

   system-view
2. Set the maximum number of attempts for sending an authentication request.

   dot1x retry *retries*

   The default setting is 2.

Sending EAP-Success packets to 802.1X clients after successful authorization

About this task

By default, the device sends an EAP-Success packet to a client after it receives a RADIUS Access-Accept packet sent by the RADIUS server for the user of that client. After that, the device grants the user access to the network through the user's access port. Upon receiving the EAP-Success packet, the client immediately initiates a DHCP request to obtain an IP address. However, if the device has not yet received authorization information assigned by the RADIUS server, the client directly obtains an IP address from its access network segment. If its access network segment is different from its authorization network segment after the RADIUS server assigns the authorization information, the client will be unable to come online.

To ensure that each 802.1X client obtains an IP address from the authorization network segment, use this feature to configure the device to send EAP-Success packets to 802.1X clients after authorization for the users of the clients succeeds.

Restrictions and guidelines

When this feature is configured, authentication for some users might fail due to untimely authorization if the RADIUS server or device needs to process a large number of authentication processes, resulting in authentication response timeout. As a best practice, use this feature based on the service processing capabilities of the device and the RADIUS server in the actual application scenario.

Procedure

1. Enter system view.

   system-view

2. Configure the device to send EAP-Success packets to 802.1X clients after authorization for the users of the clients succeeds.

   dot1x eap-success post-authorization

   By default, the device sends EAP-Success packets to 802.1X clients immediately after authentication for the users of the clients succeeds.

Discarding duplicate 802.1X EAPOL-Start requests

About this task

During 802.1X authentication, the device might receive duplicate EAPOL-Start requests from an 802.1X user. By default, the device delivers the duplicate EAPOL-Start requests to the authentication server as long as they are legal. However, this mechanism might result in authentication failure if the authentication server cannot respond to duplicate EAPOL-Start requests. To resolve this issue, perform this task on the user access interface to discard duplicate EAPOL-Start requests.

Restrictions and guidelines

As a best practice, perform this task only if the server cannot respond to duplicate EAPOL-Start requests. Do not perform this task in other situations.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Discard duplicate EAPOL-Start requests on the interface.

   dot1x duplicate-eapol-start discard

   By default, the device does not discard duplicate EAPOL-Start requests on an interface if the requests are legal.

Configuring online user handshake

About this task

The online user handshake feature checks the connectivity status of online 802.1X users. The access device sends handshake requests (EAP-Request/Identity) to online users at the interval specified by the **dot1x timer handshake-period** command. If the device does not receive any EAP-Response/Identity packets from an online user after it has made the maximum handshake attempts, the device sets the user to offline state. To set the maximum handshake attempts, use the **dot1x retry** command.

Typically, the device does not reply to 802.1X clients' EAP-Response/Identity packets with EAP-Success packets. Some 802.1X clients will go offline if they do not receive the EAP-Success packets for handshake. To avoid this issue, enable the online user handshake reply feature.

If iNode clients are deployed, you can also enable the online user handshake security feature to check authentication information in the handshake packets from clients. This feature can prevent 802.1X users that use illegal client software from bypassing iNode security check, such as dual network interface cards (NICs) detection. If a user fails the handshake security checking, the device sets the user to the offline state.

Restrictions and guidelines

- If the network has 802.1X clients that cannot exchange handshake packets with the access device, disable the online user handshake feature. This operation prevents the 802.1X connections from being incorrectly torn down.
- To use the online user handshake security feature, make sure the online user handshake feature is enabled.
- The online user handshake security feature takes effect only on the network where the iNode client and IMC server are used.
- Enable the online user handshake reply feature only if 802.1X clients will go offline without receiving EAP-Success packets from the device.
- To ensure online user handshake and new user authentication when a large number of users are present, set the following parameters to a large value:
  - Handshake timer (set by using the **dot1x timer handshake-period** command).
  - Maximum number of attempts to send an authentication request to a client (set by using the **dot1x retry** command).

Procedure

1. Enter system view.

   system-view
2. (Optional.) Set the handshake timer.

   dot1x timer handshake-period *handshake-period-value*

   The default is 15 seconds.
3. Enter interface view.

   interface *interface-type interface-number*
4. Enable the online user handshake feature.

   dot1x handshake

   By default, the feature is enabled.
5. (Optional.) Enable the online user handshake security feature.

   dot1x handshake secure

   By default, the feature is disabled.
6. (Optional.) Enable the 802.1X online user handshake reply feature.

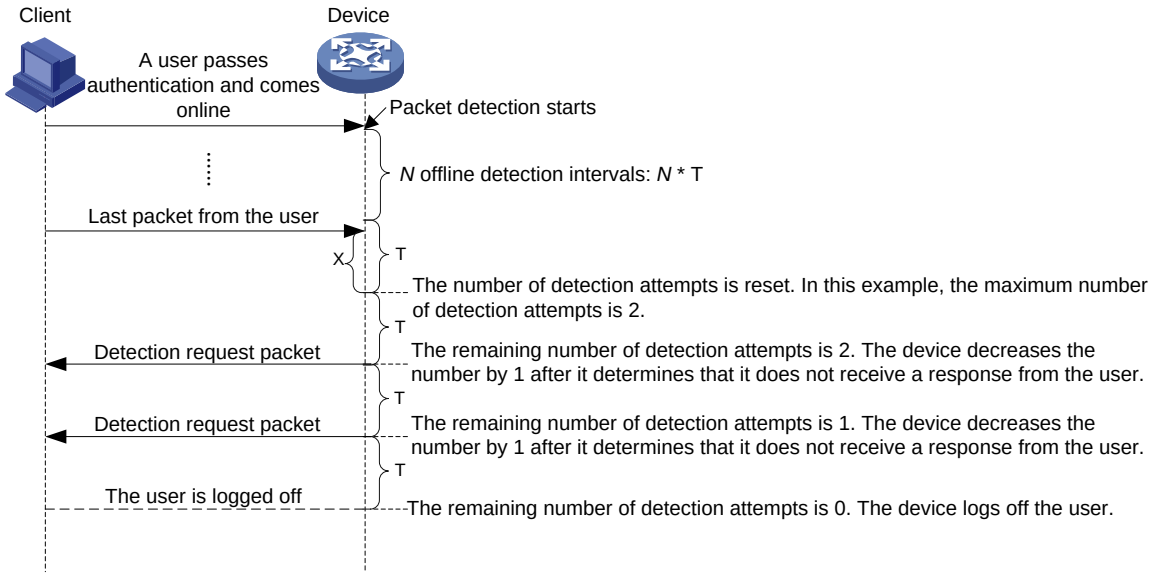
   dot1x handshake reply enable

   By default, the device does not reply to 802.1X clients' EAP-Response/Identity packets during the online handshake process.

Configuring packet detection for 802.1X authentication

About this task

When packet detection for 802.1X authentication is enabled on a port, the device sends detection packets to 802.1X users connected to that port at offline detection intervals set by using the offline detection timer. If the device does not receive a response from a user after it has made the maximum packet transmission attempts within an offline detection interval, it logs off that user and requests the RADIUS server to stop accounting for the user.



When packet detection for 802.1X authentication and 802.1X offline detection are both enabled, the device processes an 802.1X user as follows:

- If 802.1X offline detection determines that a user is online, the device does not send detection packets to that user.
- If 802.1X offline detection determines that a user is offline, the device does not immediately logs off that user. Instead, the device sends a detection packet to that user. It will log off that user if it does not receive a response from that user after it has made the maximum packet transmission attempts within an offline detection interval.

802.1X uses ARP request packets to detect the online status of IPv4 users and uses NS packets to detect the online status of IPv6 users.

Packet detection adopts the principle of counting prior to judging. The device decreases the detection attempts (packet transmission attempts) by 1 only after it determines that it does not receive a response from a user. The device stops the detection process when the number of detection attempts becomes 0. The duration from the time when the user sends the last packet to the time when the user is logged off is calculated by using the following formula: duration = (*retries* + 1) * T + X. Figure 11 shows the packet detection process. In this example, the device sends a detection packet to an 802.1X user for a maximum of two times.

Figure 11 Network diagram for packet detection process

The duration from the time when the user sends the last packet to the time when the user is logged off equals to 3 * T + X.

This feature takes effect on both of the following types of users:

- Users in preauthentication domains, authentication domains, critical domains, and Auth-Fail domains.
- Users assigned to guest VLANs, Auth-Fail VLANs, and critical VLANs.

Restrictions and guidelines

To ensure that the device is aware of user IP address changes, enable ARP snooping and ND snooping in conjunction with packet detection for 802.1X authentication. If you do not enable ARP snooping or ND snooping, the device is unaware of user IP address changes. As a result, the device still sends detection packets to the users' original IP addresses and falsely log off these users.

Procedure

1. Enter system view.

   system-view

2. Set the offline detection timer.

   dot1x timer offline-detect *offline-detect-value*

By default, the offline detection timer expires in 300 seconds.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable packet detection for 802.1X authentication.

   dot1x packet-detect enable

   By default, packet detection for 802.1X authentication is disabled.

5. Set the maximum number of attempts for sending a detection packet to an 802.1X user.

   dot1x packet-detect retry *retries*

   By default, the device sends a detection packet to an 802.1X user for a maximum of two times.

Enabling online 802.1X users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available

About this task

The 802.1X offline detection feature logs off an online 802.1X user if it has not detected traffic from that user before the offline-detect timer expires. To prevent online 802.1X users on a port from being forced offline by the 802.1X offline detection feature and stay online when none of the RADIUS servers in their ISP domain is reachable, perform this task.

Restrictions and guidelines

Use this feature only when RADIUS scheme authentication is configured for the 802.1X users on a port. If local or no authentication is also configured, offline detection might be undesirably disabled for the 802.1X users when they come online through local authentication or without authentication.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable online 802.1X users to escape from 802.1X offline detection and stay online when no reachable RADIUS authentication servers are available.

   dot1x auth-server-unavailable escape

   By default, online 802.1X users cannot escape from 802.1X offline detection (if enabled) when no reachable RADIUS authentication servers are available.

Specifying supported domain name delimiters

About this task

By default, the access device supports the at sign (@) as the delimiter. You can also configure the access device to accommodate 802.1X users that use other domain name delimiters. The configurable delimiters include the at sign (@), backslash (\), dot (.), and forward slash (/). Usernames that include domain names can use the format of *username@domain-name*, *domain-name******username*, *username***.***domain-name*, or *username***/***domain-name*.

If an 802.1X username string contains multiple configured delimiters, the rightmost delimiter is the domain name delimiter. For example, if you configure the backslash (\), dot (.), and forward slash (/) as delimiters, the domain name delimiter for the username string 121.123/22\@abc is the backslash (\). The username is **@abc** and the domain name is **121.123/22**.

Restrictions and guidelines

If a username string contains none of the delimiters, the access device authenticates the user in the mandatory or default ISP domain.

If you configure the access device to send usernames with domain names to the RADIUS server, make sure the domain delimiter can be recognized by the RADIUS server. For username format configuration, see the **user-name-format** command in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Specify a set of domain name delimiters for 802.1X users.

   dot1x domain-delimiter *string*

   By default, only the at sign (@) delimiter is supported.

Removing the VLAN tags of 802.1X protocol packets sent out of a port

About this task

This feature operates on a hybrid port to have it send 802.1X protocol packets with their VLAN tags removed, regardless of whether the port is a tagged or untagged member of a VLAN.

Use this feature if the 802.1X-enabled hybrid port is a tagged member of its PVID and the attached 802.1X clients cannot recognize VLAN-tagged 802.1X protocol packets.

Restrictions and guidelines

This feature removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this feature if VLAN-aware 802.1X clients are attached to the port. As a best practice, perform this task only in the described applicable scenario.

Prerequisites

Set the link type of the 802.1X-enabled port to hybrid. For more information, see VLAN configuration in *Layer 2 LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Remove the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients.

   dot1x eapol untag

   By default, whether the device removes the VLAN tags of all 802.1X protocol packets sent out of a port to 802.1X clients depends on the configuration in the VLAN module.

CAUTION:

This command removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this command if VLAN-aware 802.1X clients are attached to the port. As a best practice, use this command only in the described applicable scenario.

Setting the maximum number of 802.1X authentication attempts for MAC authenticated users

About this task

When a port uses both 802.1X authentication and MAC authentication, the device accepts 802.1X authentication requests from MAC authenticated users. If a MAC authenticated user passes 802.1X authentication, the user will come online as an 802.1X user. If the user fails 802.1X authentication, the user continues to make 802.1X authentication attempts depending on client configuration.

Perform this task to limit the number of 802.1X authentication attempts made by a MAC authenticated user.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the maximum number of 802.1X authentication attempts for MAC authenticated users on the port.

   dot1x after-mac-auth max-attempt *max-attempts*

   By default, the number of 802.1X authentication attempts for MAC authenticated users is not limited on a port.

Enabling 802.1X user IP freezing

About this task

This feature works with the IP source guard feature. 802.1X-based IP source guard requires that 802.1X clients support sending user IP addresses to the access device. The device uses information such as user MAC addresses and IP addresses obtained through 802.1X to generate IPSG bindings to filter out IPv4 packets from unauthenticated 802.1X users. For information about IP source guard, see "Configuring IP source guard."

This feature prevents any authenticated 802.1X users on a port from changing their IP addresses. After you enable this feature, the port does not update the IP addresses in dynamic IPSG bindings for 802.1X users. If an 802.1X user uses an IP address different from the IP address in its IPSG binding entry, the port denies the user access.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable 802.1X user IP freezing.

   dot1x user-ip freeze

   By default, 802.1X user IP freezing is disabled.

Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users

About this task

IMPORTANT:

This feature must operate in conjunction with the IP source guard (IPSG) feature.

By default, the device generates a dynamic IPv4SG or IPv6SG binding entry for an 802.1X authenticated user after the user obtains a static or DHCP assigned IP address.

To allow only 802.1X users with DHCP assigned IP addresses to access the network, perform the following operations:

- Enable IPSG.
- Disable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.
- Enable DHCP snooping. The device will generate IPv4SG or IPv6SG binding entries for the users based on DHCP snooping.

For more information about IPSG, see IP source guard in *Security Configuration Guide*.

Restrictions and guidelines

This feature takes effect only on 802.1X users that come online after the feature is enabled. If the IP address of an online 802.1X user changes, the device will update the dynamic IPv4SG or IPv6SG binding entry for the user.

Disabling this feature does not delete the existing dynamic IPv4SG or IPv6SG binding entries for online 802.1X users. If the IP address of an online 802.1X user changes after the feature is disabled, the device will delete the dynamic IPv4SG or IPv6SG binding entry for the user.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.

   dot1x { **ip-verify-source** | **ipv6-verify-source** } **enable**

   By default, generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users is enabled.

Configuring 802.1X MAC address binding

About this task

This feature can automatically bind MAC addresses of authenticated 802.1X users to the users' access port and generate 802.1X MAC address binding entries. You can also use the **dot1x mac-binding** *mac-address* command to manually add 802.1X MAC address binding entries.

802.1X MAC address binding entries never age out. They can survive a user logoff or a device reboot. If users in the 802.1X MAC address binding entries perform 802.1X authentication on another port, they cannot pass authentication.

Restrictions and guidelines

The 802.1X MAC address binding feature takes effect only when the port performs MAC-based access control.

To delete an 802.1X MAC address binding entry, use the **undo dot1x mac-binding** *mac-address* command. An 802.1X MAC address binding entry cannot be deleted when the user in the entry is online.

After the number of 802.1X MAC address binding entries reaches the upper limit of concurrent 802.1X users (set by using the **dot1x max-user** command), the following restrictions exist:

- Users not in the binding entries will fail authentication even after users in the binding entries go offline.
- New 802.1X MAC address binding entries are not allowed.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the 802.1X MAC address binding feature.
   dot1x mac-binding enable
   By default, the feature is disabled.
4. (Optional.) Manually add an 802.1X MAC address binding entry.
   dot1x mac-binding *mac-address*
   By default, no 802.1X MAC address binding entries exist on a port.

Configuring the EAD assistant feature

Restrictions and guidelines

- If you enable EAD assistant in conjunction with port security, EAD assistant cannot take effect on ports operating in autoLearn port security mode.
- To make the EAD assistant feature take effect on an 802.1X-enabled port, you must set the port authorization mode to **auto**.
- When global MAC authentication is enabled, the free IPs cannot take effect.
- When port security is enabled, the free IPs cannot take effect.
- EAD assistant might cause malfunction of 802.1X Auth-Fail VLANs and critical VLANs. To ensure that users can correctly access Auth-Fail VLANs and critical VLANs, use the **dot1x ead-assistant permit authentication-escape** command.
- The **dot1x ead-assistant permit authentication-escape** command cannot take effect on ports in port-based access control.
- If you use free IP and Auth-Fail VLAN features together, make sure the resources in the Auth-Fail VLAN are on the free IP segments.
- The server that provides the redirect URL must be on the free IP accessible to unauthenticated users.
- If you configure both EAD assistant and 802.1X unicast trigger on a port that performs port-based access control, 802.1X unicast trigger cannot take effect.

When you use both EAD assistant and MAC authentication on the device, follow these restrictions and guidelines:

- If both EAD assistant and MAC authentication are configured, the device does not mark the MAC address of a user that has failed MAC authentication as a silent MAC address. If the user has never passed MAC authentication, packets from the user can trigger MAC authentication again only after the user's EAD entry ages out.
- As a best practice, do not configure MAC authentication guest VLANs or critical VLANs. The VLANs might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- As a best practice, do not configure the Web authentication or IP source guard feature. These features might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- If the MAC address of a user has been marked as a silent MAC address before you enable EAD assistant, packets from the user can trigger 802.1X or MAC authentication only after the quiet timer expires.

Procedure

1. Enter system view.

   system-view

2. Enable the EAD assistant feature.

   dot1x ead-assistant enable

   By default, this feature is disabled.

3. Configure a free IP.

   dot1x ead-assistant free-ip *ip-address* { *mask-length* | *mask-address* }

   Repeat this command to configure multiple free IPs.

4. (Optional.) Configure the redirect URL if users will use Web browsers to access the network.

   dot1x ead-assistant url *url-string* [**secondary**] [**track** *track-entry-number*]

   By default, no redirect URL exists.

   By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

5. (Optional.) Set the EAD rule timer.

   dot1x timer ead-timeout *ead-timeout-value*

   The default setting is 30 minutes.

   To avoid using up ACL resources when a large number of EAD users exist, you can shorten the EAD rule timer.

6. (Optional.) Enable support for correctly using Auth-Fail VLANs and critical VLANs when 802.1X EAD assistant is enabled.

   dot1x ead-assistant permit authentication-escape

   By default, 802.1X Auth-Fail VLANs and critical VLANs cannot function correctly when 802.1X EAD assistant is enabled.

Setting the maximum size of EAP-TLS fragments sent to the server

About this task

When the device uses EAP-TLS authentication method in EAP relay mode, the RADIUS packets might exceed the maximum packet size supported by the RADIUS server. This situation typically occurs when long EAP-TLS messages are encapsulated in the EAP-Message attribute of the RADIUS packet sent to the RADIUS server.

To avoid authentication failures caused by oversized packets, fragment the EAP-TLS messages depending on the maximum RADIUS packet size supported by the remote RADIUS server.

For example, the maximum packet length allowed by the server is 1200 bytes and the length of a RADIUS packet (excluding the EAP-Message attribute) is 800 bytes. To make sure the maximum length of a RADIUS packet does not exceed 1200 bytes, you must set the maximum length of an EAP-TLS fragment to a value less than 400 bytes.

Restrictions and guidelines

802.1X EAP-TLS fragmentation takes effect only when EAP relay mode is used. For more information about enabling EAP relay, see "Enabling EAP relay or EAP termination."

Procedure

1. Enter system view.

   system-view
2. Enable 802.1X EAP-TLS fragmentation and set the maximum EAP-TLS fragment size.

   dot1x eap-tls-fragment to-server *eap-tls-max-length*

   By default, EAP-TLS messages are not fragmented.

Setting the unicast-trigger quiet timer

About this task

To suppress the unicast trigger from requesting an unknown source MAC address for 802.1X authentication after it has made the maximum number of failed attempts, perform this task.

The 802.1X unicast-trigger quiet timer sets the duration that the unicast trigger is suppressed from sending EAP-Request/Identity requests to an unknown MAC address. This timer starts when the device fails to receive a response from an unknown MAC address after the number of unicast EAP-Request/Identity requests sent to that MAC address has reached the limit. The limit is configurable with the **dot1x retry** command.

Restrictions and guidelines

The network access delay introduced by the unicast-trigger quiet timer increases as the timer value increases. When you set the unicast-trigger quiet timer, make sure its value does not introduce undesired delay for 802.1X authentication users to come online.

You cannot use the unicast-trigger quiet timer in conjunction with the guest VLAN and EAD assistant feature.

Procedure

1. Enter system view.

   system-view
2. Set the unicast-trigger quiet timer.

   dot1x timer unicast-trigger quiet-period *quiet-period-value*

By default, the unicast-trigger timer is set to 0 seconds, which indicates that the unicast-trigger timer is not enabled.

Logging off 802.1X users

About this task

Perform this task to log off specified 802.1X users and clear information about these users from the device. These users must perform 802.1X authentication to come online again.

Procedure

To log off 802.1X users, execute the following command in user view:

reset dot1x access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** } | **username** *username* | **vlan** *vlan-id*]

Enabling 802.1X user logging

About this task

This feature enables the device to generate logs about 802.1X users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive 802.1X user log entries, use this feature only if you need to analyze abnormal 802.1X user logins or logouts.

Procedure

1. Enter system view.

   system-view

2. Enable 802.1X user logging.

   dot1x access-user log enable [**abnormal-logoff** | **failed-login** | **ip-change** | **maxnum-clear-threshold** | **maxnum-trigger-threshold** | **normal-logoff** | **successful-login**] *

   By default, 802.1X user logging is disabled.

   If you do not specify any parameters, this command enables all types of 802.1X user logs.

Configuring SNMP notifications for 802.1X

About this task

After you enable SNMP notifications for 802.1X, the 802.1X module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

The following are SNMP notifications available for 802.1X:

- **dot1x-not-support**—Enables SNMP notifications about unavailability of 802.1X on interfaces.
- **resource-not-enough**—Enables SNMP notifications about insufficient ACL resources.

- **unicast-not-support**—Enables SNMP notifications about unavailability of 802.1X unicast trigger on interfaces.
- **user-maxnum**—Enables SNMP notifications about 802.1X user access ratio.

After you enable SNMP notifications about 802.1X user access ratio and use the **dot1x max-user-alarm** command to set the alarm threshold and alarm clear threshold:

- If the percentage of 802.1X user access ratio on an interface reaches the specified alarm threshold for the first time, or increases to the alarm threshold from a value below or equal to the alarm clear threshold, the device sends an alarm notification.
- If the percentage of 802.1X user access ratio on the interface drops to the alarm clear threshold from a value above or equal to the alarm threshold, the device sends an alarm clear notification.

Procedure

1. Enter system view.

   system-view
2. Enable SNMP notifications for 802.1X.

   snmp-agent trap enable dot1x [**dot1x-not-support** | **resource-not-enough** | **unicast-not-support** | **user-maxnum**] *

   By default, SNMP notifications for 802.1X are disabled.

Display and maintenance commands for 802.1X

Execute **display** commands in any view and **reset** commands in user view.

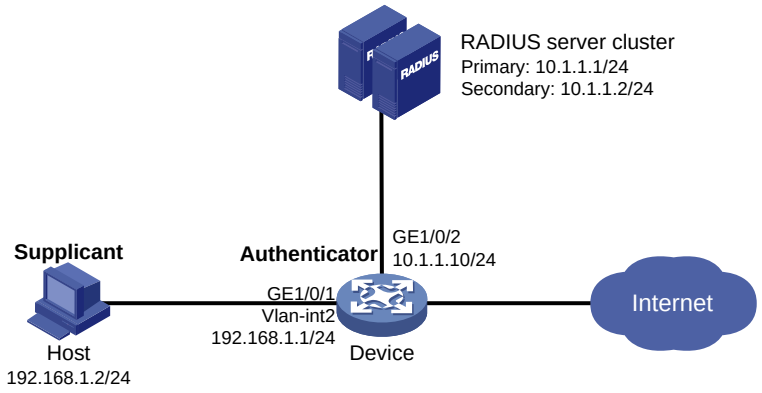
Task	Command
Display 802.1X session information, statistics, or configuration information of specified or all ports.	**display dot1x** [**sessions** | **statistics**] [**interface** *interface-type interface-number*]
Display information about 802.1X access profiles.	**display dot1x access-profile** [**name** *profile-name*]
Display online 802.1X user information.	**display dot1x connection** [**open**] [[**interface** *interface-type interface-number* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** } | **slot** *slot-number* | **user-name** *name-string*] | **user-mac** *mac-address*]
Display the MAC addresses of 802.1X users in a type of 802.1X VLAN.	**display dot1x mac-address** { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Display unknown source MAC addresses in the unicast-trigger quiet period.	**display dot1x unicast-trigger quiet-mac** [**interface** *interface-type interface-number*]
Remove users from the 802.1X guest VLAN on a port.	**reset dot1x guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Clear 802.1X statistics.	**reset dot1x statistics** [**interface** *interface-type interface-number*]

Task	Command
Remove the records of unknown source MAC addresses in the unicast-trigger quiet period.	**reset dot1x unicast-trigger quiet-mac** [**interface** *interface-type interface-number* | **mac-address** *mac-address*]

802.1X authentication configuration examples

Example: Configuring basic 802.1X authentication

Network configuration



As shown in Figure 12, the access device performs 802.1X authentication for users that connect to GigabitEthernet 1/0/1. Implement MAC-based access control on the port, so the logoff of one user does not affect other online 802.1X users.

Use RADIUS servers to perform authentication, authorization, and accounting for the 802.1X users. If RADIUS authentication fails, perform local authentication on the access device.

Configure the RADIUS server at 10.1.1.1/24 as the primary authentication and accounting server, and the RADIUS server at 10.1.1.2/24 as the secondary authentication and accounting server. Assign all users to ISP domain **bbb**.

Set the shared key to **name** for packets between the access device and the authentication server. Set the shared key to **money** for packets between the access device and the accounting server.

Figure 12 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers and add user accounts for the 802.1X users. Make sure the RADIUS servers can provide authentication, authorization, and accounting services. (Details not shown.)
2. Assign an IP address to each interface. (Details not shown.)
3. Configure user accounts for the 802.1X users on the access device:

   # Add a local network access user with username **localuser** and password **123456TESTplat&!** in plaintext. (Make sure the username and password are the same as those configured on the RADIUS servers.)

   ```
   <Device> system-view
   [Device] local-user localuser class network
   ```

```
[Device-luser-network-localuser] password simple 123456TESTplat&!
```

Set the service type to **lan-access**.

```
[Device-luser-network-localuser] service-type lan-access
[Device-luser-network-localuser] quit
```

4. Configure a RADIUS scheme on the access device:

Create a RADIUS scheme named **radius1** and enter RADIUS scheme view.

```
[Device] radius scheme radius1
```

Specify the IP addresses of the primary authentication and accounting RADIUS servers.

```
[Device-radius-radius1] primary authentication 10.1.1.1
[Device-radius-radius1] primary accounting 10.1.1.1
```

Configure the IP addresses of the secondary authentication and accounting RADIUS servers.

```
[Device-radius-radius1] secondary authentication 10.1.1.2
[Device-radius-radius1] secondary accounting 10.1.1.2
```

Specify the shared key between the access device and the authentication server.

```
[Device-radius-radius1] key authentication simple name
```

Specify the shared key between the access device and the accounting server.

```
[Device-radius-radius1] key accounting simple money
```

Exclude the ISP domain names from the usernames sent to the RADIUS servers.

```
[Device-radius-radius1] user-name-format without-domain
[Device-radius-radius1] quit
```

NOTE:

The access device must use the same username format as the RADIUS server. If the RADIUS server includes the ISP domain name in the username, so must the access device.

5. Configure an ISP domain on the access device:

Create an ISP domain named **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme **radius1** to the ISP domain, and specify local authentication as the secondary authentication method.

```
[Device-isp-bbb] authentication lan-access radius-scheme radius1 local
[Device-isp-bbb] authorization lan-access radius-scheme radius1 local
[Device-isp-bbb] accounting lan-access radius-scheme radius1 local
[Device-isp-bbb] quit
```

6. Configure 802.1X on the access device:

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
```

Enable MAC-based access control on the port. By default, the port uses MAC-based access control.

```
[Device-GigabitEthernet1/0/1] dot1x port-method macbased
```

Specify ISP domain **bbb** as the mandatory domain.

```
[Device-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

7. Configure the 802.1X client. If an iNode client is used, do not select the **Carry version info** option in the client configuration. (Details not shown.)

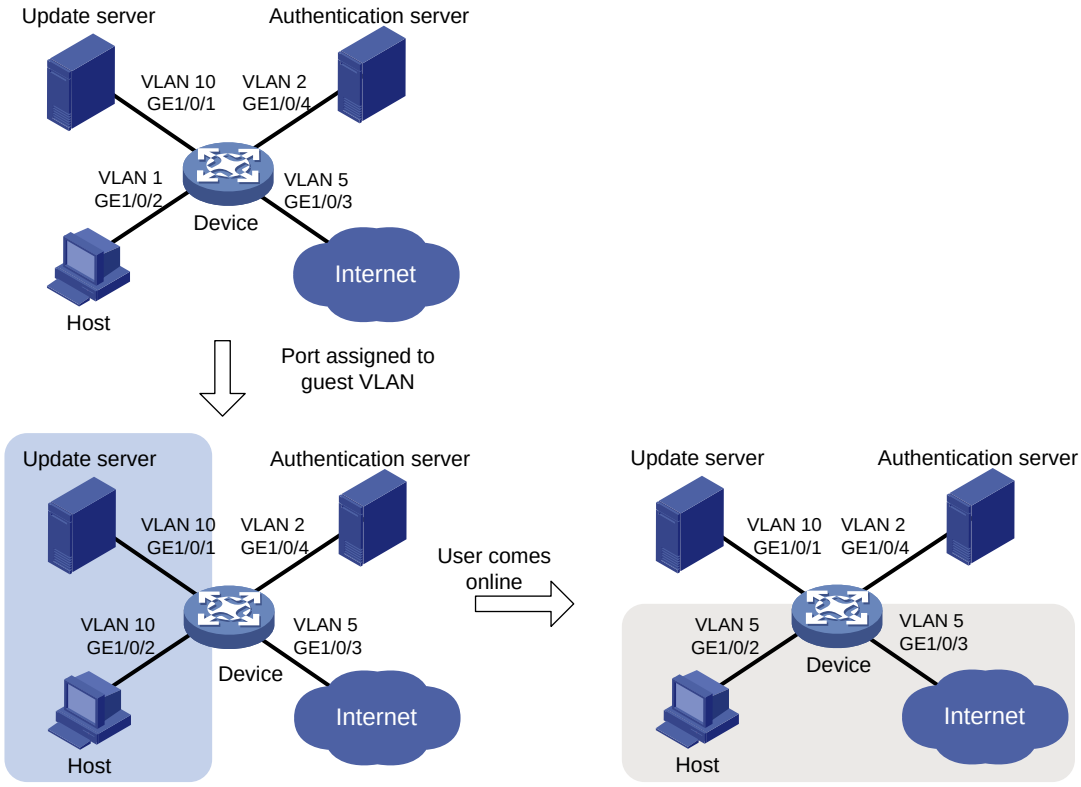
Verifying the configuration

Verify the 802.1X configuration on GigabitEthernet 1/0/1.

```
[Device] display dot1x interface gigabitethernet 1/0/1
```

Display the user connection information after an 802.1X user passes authentication.

```
[Device] display dot1x connection
```



Example: Configuring 802.1X guest VLAN and authorization VLAN

Network configuration

As shown in Figure 13:

- Use RADIUS servers to perform authentication, authorization, and accounting for 802.1X users that connect to GigabitEthernet 1/0/2. Implement port-based access control on the port.
- Configure VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2. The host and the update server are both in VLAN 10, and the host can access the update server and download the 802.1X client software.
- Configure a QoS policy to deny packets destined for the Internet (5.1.1.1) and apply the QoS policy to the outbound direction of VLAN 10. The configuration prevents users in the 802.1X guest VLAN from accessing the Internet before they pass 802.1X authentication.
- After the host passes 802.1X authentication, the access device assigns the host to VLAN 5 where GigabitEthernet 1/0/3 is. The host can access the Internet.

Figure 13 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS server to provide authentication, authorization, and accounting services. Configure user accounts and authorization VLAN (VLAN 5 in this example) for the users. (Details not shown.)
2. Create VLANs, and assign ports to the VLANs on the access device.

   NOTE:

   By default, VLAN 1 exists and all ports belong to the VLAN. You do not need to create the VLAN or assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   <Device> system-view
   [Device] vlan 10
   [Device-vlan10] port gigabitethernet 1/0/1
   [Device-vlan10] quit
   [Device] vlan 2
   [Device-vlan2] port gigabitethernet 1/0/4
   [Device-vlan2] quit
   [Device] vlan 5
   [Device-vlan5] port gigabitethernet 1/0/3
   [Device-vlan5] quit
   ```

3. Configure a QoS policy:

   # Configure advanced ACL 3000 to match packets destined for 5.1.1.1.

   ```
   [Device] acl advanced 3000
   [Device-acl-ipv4-adv-3000] rule permit ip destination 5.1.1.1 0.0.0.255
   [Device-acl-ipv4-adv-3000] quit
   ```

   # Specify advanced ACL 3000 in traffic class **classifier_1** to match traffic.

   ```
   [Device] traffic classifier classifier_1
   [Device-classifier-classifier_1] if-match acl 3000
   [Device-classifier-classifier_1] quit
   ```

   # Configure traffic behavior **behavior_1** to deny matching packets.

   ```
   [Device] traffic behavior behavior_1
   [Device-behavior-behavior_1] filter deny
   [Device-behavior-behavior_1] quit
   ```

   # Configure QoS policy **policy_1** to associate traffic class **classifier_1** with traffic behavior **behavior_1**.

   ```
   [Device] qos policy policy_1
   [Device-qospolicy-policy_1] classifier classifier_1 behavior behavior_1
   [Device-qospolicy-policy_1] quit
   ```

   # Apply QoS policy **policy_1** to the outbound direction of VLAN 10.

   ```
   [Device] qos vlan-policy policy_1 vlan 10 outbound
   ```

4. Configure a RADIUS scheme on the access device:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.11.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.11.1.1 1812
   ```

Specify the server at 10.11.1.1 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.11.1.1 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain on the access device:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X on the access device:

Enable 802.1X on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] dot1x
```

Implement port-based access control on the port.

```
[Device-GigabitEthernet1/0/2] dot1x port-method portbased
```

Set the port authorization mode to **auto**. By default, the port uses the auto mode.

```
[Device-GigabitEthernet1/0/2] dot1x port-control auto
```

Specify VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2.

```
[Device-GigabitEthernet1/0/2] dot1x guest-vlan 10
[Device-GigabitEthernet1/0/2] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

7. Configure the 802.1X client. Make sure the 802.1X client can update its IP address after the access port is assigned to the guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Verify the 802.1X guest VLAN configuration on GigabitEthernet 1/0/2.

```
[Device] display dot1x interface gigabitethernet 1/0/2
```

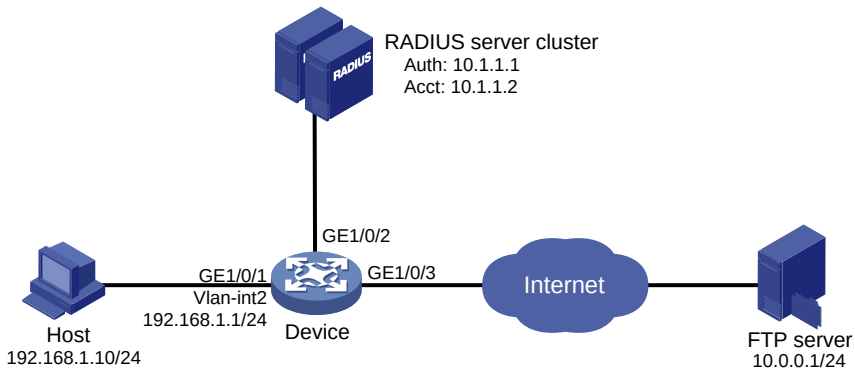
Verify that GigabitEthernet 1/0/2 is assigned to VLAN 10 before any user passes authentication on the port.

```
[Device] display vlan 10
```

After a user passes authentication, display information on GigabitEthernet 1/0/2. Verify that GigabitEthernet 1/0/2 is assigned to VLAN 5.

```
[Device] display interface gigabitethernet 1/0/2
```

Example: Configuring 802.1X with ACL assignment



Network configuration

As shown in Figure 14, the host that connects to GigabitEthernet 1/0/1 must pass 802.1X authentication to access the Internet.

Perform 802.1X authentication on GigabitEthernet 1/0/1. Use the RADIUS server at 10.1.1.1 as the authentication and authorization server, and the RADIUS server at 10.1.1.2 as the accounting server.

Configure ACL assignment on GigabitEthernet 1/0/1 to deny access of 802.1X users to the FTP server from 8:00 to 18:00 on weekdays.

Figure 14 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Add user accounts and specify the ACL (ACL 3000 in this example) for the users. (Details not shown.)
2. Assign an IP address to each interface, as shown in Figure 14. (Details not shown.)
3. Configure a RADIUS scheme on the access device:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   <Device> system-view
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

   # Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

   ```
   [Device-radius-2000] key authentication simple abc
   ```

   # Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

   ```
   [Device-radius-2000] key accounting simple abc
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS server.

   ```
   [Device-radius-2000] user-name-format without-domain
   ```

```
[Device-radius-2000] quit
```

4. Configure an ISP domain on the access device:

   # Create ISP domain **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme 2000
   [Device-isp-bbb] authorization lan-access radius-scheme 2000
   [Device-isp-bbb] accounting lan-access radius-scheme 2000
   [Device-isp-bbb] quit
   ```

5. Configure a time range named **ftp** from 8:00 to 18:00 on weekdays on the access device.

   ```
   [Device] time-range ftp 8:00 to 18:00 working-day
   ```

6. Configure ACL 3000 to deny packets destined for the FTP server at 10.0.0.1 during the specified time range on the access device.

   ```
   [Device] acl advanced 3000
   [Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0 time-range ftp
   [Device-acl-ipv4-adv-3000] quit
   ```

7. Configure 802.1X on the access device:

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

8. Configure the 802.1X client. Make sure the client is able to update its IP address after the access port is assigned to the 802.1X guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Use the user account to pass authentication. (Details not shown.)

Verify that the user cannot ping the FTP server at any time from 8:00 to 18:00 on any weekday.

```
C:\>ping 10.0.0.1

Pinging 10.0.0.1 with 32 bytes of data:

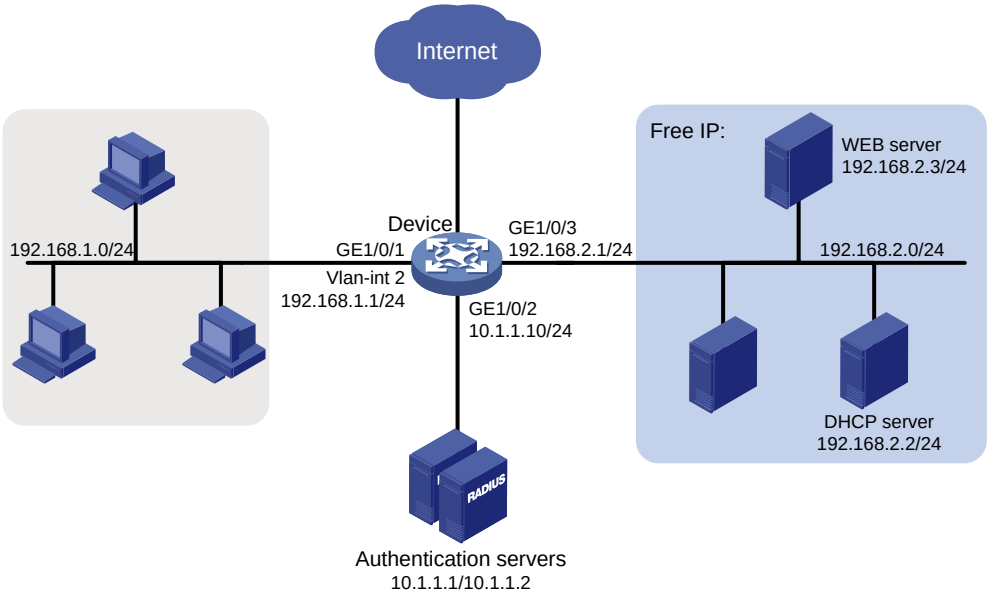
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

The output shows that ACL 3000 is active on the user, and the user cannot access the FTP server.

Example: Configuring 802.1X with EAD assistant (with DHCP relay agent)

Network configuration



As shown in Figure 15:

- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A DHCP server and a Web server are deployed on the 192.168.2.0/24 subnet for users to obtain IP addresses and download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can obtain IP addresses and download software.
- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 15 Network diagram

Procedure

1. Make sure the DHCP server, the Web server, and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure DHCP relay:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP relay agent on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select relay
   ```

   # Specify the DHCP server 192.168.2.2 on the relay agent interface VLAN-interface 2.

```
[Device-Vlan-interface2] dhcp relay server-address 192.168.2.2
[Device-Vlan-interface2] quit
```

4. Configure a RADIUS scheme:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

   # Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

   ```
   [Device-radius-2000] key authentication simple abc
   ```

   # Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

   ```
   [Device-radius-2000] key accounting simple abc
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS server.

   ```
   [Device-radius-2000] user-name-format without-domain
   [Device-radius-2000] quit
   ```

5. Configure an ISP domain:

   # Create ISP domain **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme 2000
   [Device-isp-bbb] authorization lan-access radius-scheme 2000
   [Device-isp-bbb] accounting lan-access radius-scheme 2000
   [Device-isp-bbb] quit
   ```

6. Configure 802.1X:

   # Configure the free IP.

   ```
   [Device] dot1x ead-assistant free-ip 192.168.2.0 24
   ```

   # Configure the redirect URL for client software download.

   ```
   [Device] dot1x ead-assistant url https://192.168.2.3
   ```

   # Enable the EAD assistant feature.

   ```
   [Device] dot1x ead-assistant enable
   ```

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

Verifying the configuration

Verify the 802.1X configuration.

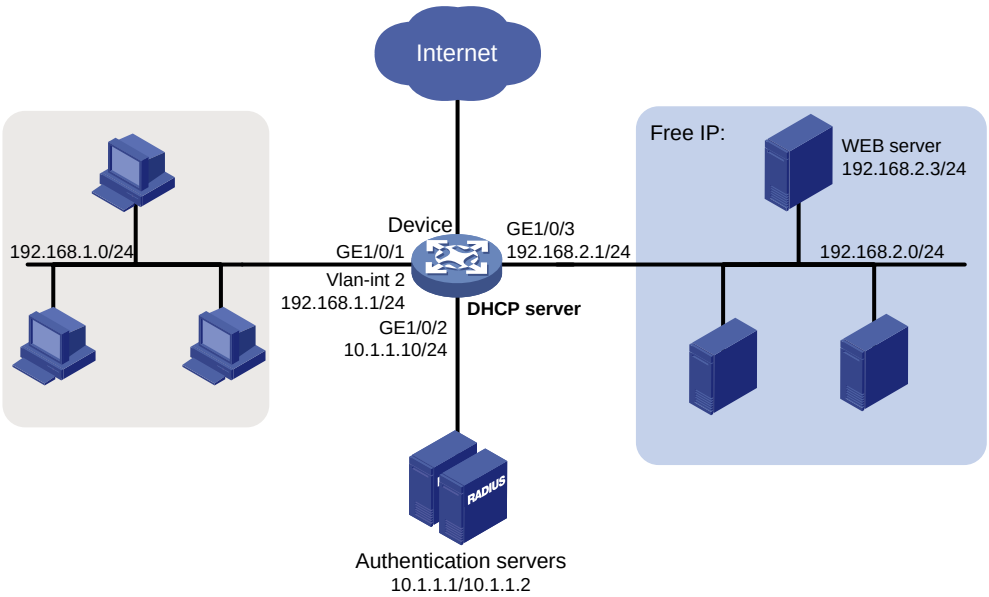
```
[Device] display dot1x
```

Verify that you can ping an IP address on the free IP subnet from a host before the user on the host passes 802.1X authentication. (Details not shown.)

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Example: Configuring 802.1X with EAD assistant (with DHCP server)

Network configuration



As shown in Figure 16:

- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A Web server is deployed on the 192.168.2.0/24 subnet for users to download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can download software.
- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 16 Network diagram

Procedure

1. Make sure the Web server and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure the DHCP server:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP server on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select server
   ```

```
[Device-Vlan-interface2] quit
```

Create DHCP address pool **0**.

```
[Device] dhcp server ip-pool 0
```

Specify subnet 192.168.1.0/24 in DHCP address pool 0.

```
[Device-dhcp-pool-0] network 192.168.1.0 mask 255.255.255.0
```

Specify the gateway address 192.168.1.1 in DHCP address pool 0.

```
[Device-dhcp-pool-0] gateway-list 192.168.1.1
[Device-dhcp-pool-0] quit
```

4. Configure a RADIUS scheme:

Create RADIUS scheme **2000** and enter RADIUS scheme view.

```
[Device] radius scheme 2000
```

Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

```
[Device-radius-2000] primary authentication 10.1.1.1 1812
```

Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.1.1.2 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X:

Configure the free IP.

```
[Device] dot1x ead-assistant free-ip 192.168.2.0 24
```

Configure the redirect URL for client software download.

```
[Device] dot1x ead-assistant url https://192.168.2.3
```

Enable the EAD assistant feature.

```
[Device] dot1x ead-assistant enable
```

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

Verifying the configuration

Verify the 802.1X configuration.

```
[Device] display dot1x
```

Verify that you can ping an IP address on the free IP subnet from a host before the user on the host passes 802.1X authentication. (Details not shown.)

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Troubleshooting 802.1X

EAD assistant Web redirection failure

Symptom

Unauthenticated users are not redirected to the specified URL server after they enter external website addresses in their Web browsers.

Analysis

Redirection will not happen for one of the following reasons:

- The address is in the string format. The operating system of the host regards the string as a website name and tries to resolve the string. If the resolution fails, the operating system sends an ARP request, but the target address is not in the dotted decimal notation. The redirection feature does redirect this kind of ARP request.
- The address is within a free IP segment. No redirection will take place, even if no host is present with the address.
- The server is not in a free IP segment.
- No server is using the redirect URL, or the server with the URL does not provide Web services.

Solution

To resolve the issue:

1. Enter a dotted decimal IP address that is not in any free IP segments.
2. Verify that the access device and the server are configured correctly.
3. If the issue persists, contact H3C Support.

Configuring MAC authentication

About MAC authentication

MAC authentication controls network access by authenticating source MAC addresses on a port. The feature does not require client software, and users do not have to enter a username and password for network access. The device initiates a MAC authentication process when it detects an unknown source MAC address on a MAC authentication-enabled port. If the MAC address passes authentication, the user can access authorized network resources. If the authentication fails, the device marks the MAC address as a silent MAC address, drops the packet, and starts a quiet timer. The device drops all subsequent packets from the MAC address within the quiet time. The quiet mechanism avoids repeated authentication during a short time.

User account policies

MAC authentication supports the following user account policies:

- **Global user account policy**, which can be either of the following options:
  - **MAC-based user account policy**—One MAC-based user account for each user. As shown in Figure 1, the access device uses the source MAC addresses in packets as the usernames and passwords of users for MAC authentication. This policy is suitable for an insecure environment.

    NOTE:

    MAC-based user account policy also supports configuring a password shared by all MAC-based user accounts.

  - **Shared user account policy**—One shared user account for all users. You specify one username and password (which are not necessarily a MAC address) for all MAC authentication users on the access device, as shown in Figure 2. This policy is suitable for a secure environment.
- **MAC range-specific user account policy**—One shared user account for users in a specific MAC address range. You specify one username and password (which are not necessarily a MAC address) for users in a specific MAC address range on the access device, as shown in Figure 3. For example, you can specify a username and password for users with a specific OUI for MAC authentication.

IMPORTANT:

- You can use global and MAC range-specific user account policies together. For users in a MAC address range, the MAC range-specific user account settings have higher priority than the global user account settings.
- If a RADIUS server is used for MAC authentication, you must create the user accounts on the RADIUS server based on the user account policy on the access device.

Figure 1 MAC-based user account policy

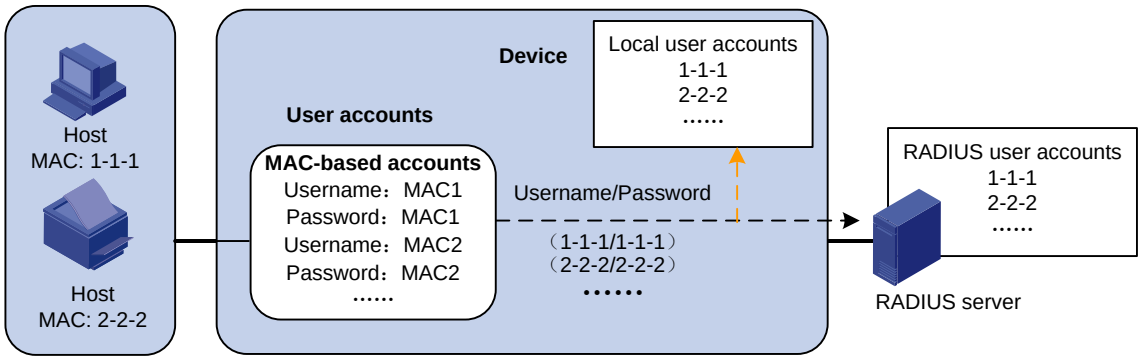

Figure 2 Shared user account policy (global)

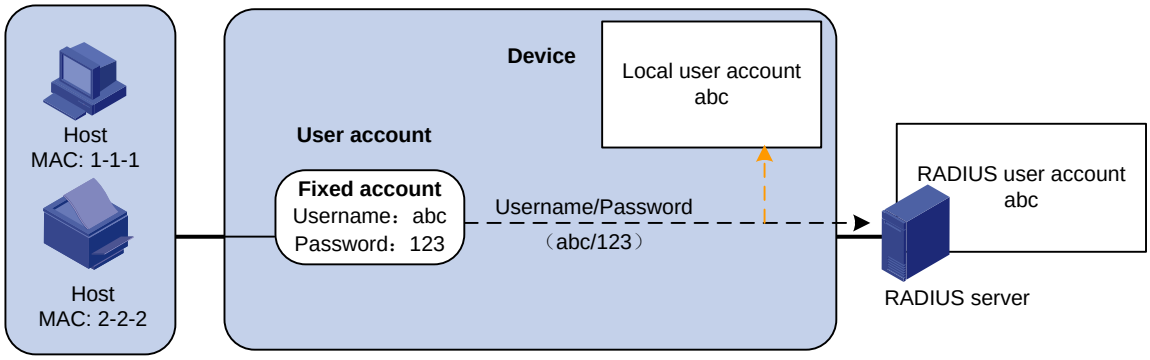

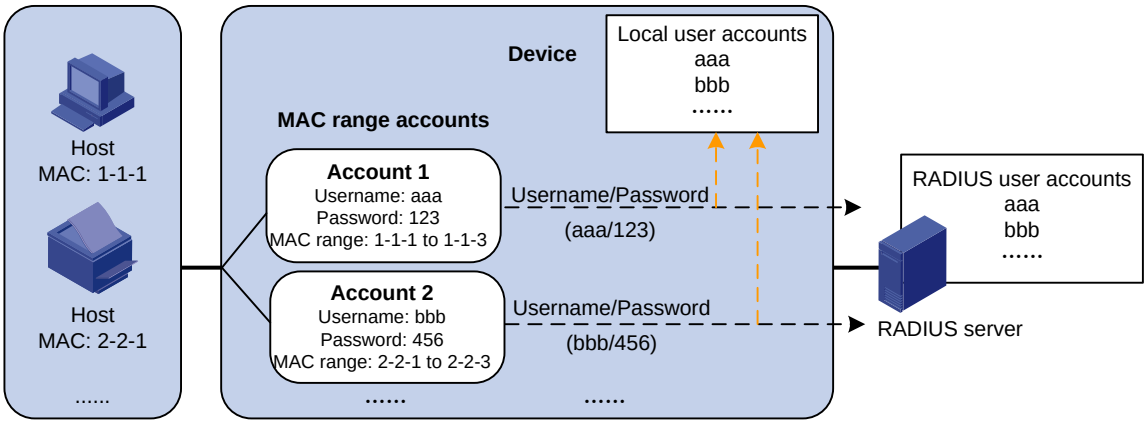

Figure 3 Shared user account policy (specific to MAC address ranges)

Authentication methods

You can perform MAC authentication on the access device (local authentication) or through a RADIUS server.

For more information about configuring local authentication and RADIUS authentication, see "Configuring AAA."

RADIUS authentication

If MAC-based accounts are used, the access device by default sends the source MAC address of a packet as the username and password to the RADIUS server for authentication. If a password is

configured for MAC-based accounts, the access device sends the configured password as the password to the RADIUS server.

If a shared account is used, the access device sends the shared account username and password to the RADIUS server for authentication.

The access device and the RADIUS server use Password Authentication Protocol (PAP) or Challenge Handshake Authentication Protocol (CHAP) for communication.

Local authentication

If MAC-based accounts are used, the access device by default uses the source MAC address of a packet as the username and password to search the local account database for a match. If a password is configured for MAC-based accounts, the device uses the configured password to search the local account database for a match.

If a shared account is used, the access device uses the shared account username and password to search the local account database for a match.

VLAN assignment

Authorization VLAN

The authorization VLAN controls the access of a MAC authentication user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port.

IMPORTANT:

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 1.

Table 1 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection

VLANs by IDs
VLANs by names
VLAN group name
	The device selects an authorization VLAN from the VLAN group for a user according to the following rules:
	• On a hybrid port with MAC-based VLAN enabled:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online MAC authentication users, the device selects the VLAN with the lower ID.
	• On an access, trunk, or MAC-based VLAN disabled hybrid port:
	  ○ If the port does not have online users, the device selects the VLAN with the lowest ID.
	  ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails.

VLAN IDs with suffixes	1. The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. 2. The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on a MAC authentication-enabled port

Table 2 describes the way the network access device handles authorization VLANs (except for the VLANs specified with suffixes) for MAC authenticated users on a port.

Table 2 VLAN manipulation

Port type	VLAN manipulation
• Access port • Trunk port • Hybrid port with MAC-based VLAN disabled	• The device assigns the port to the first authenticated user's authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute. • If the authorization VLAN has the tagged attribute, the device assigns the port to the authorization VLAN without changing its PVID. **NOTE:** The tagged attribute is supported only on trunk and hybrid ports.
Hybrid port with MAC-based VLAN enabled	The device maps the MAC address of each user to its own authorization VLAN regardless of whether the port is a tagged member. The PVID of the port does not change.

IMPORTANT:

- If the users are attached to a port whose link type is access, make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute.
- When you assign VLANs to users attached to a trunk port or a MAC-based VLAN disabled hybrid port, make sure there is only one untagged VLAN. If a different untagged VLAN is assigned to a subsequent user, the user cannot pass authentication.
- As a best practice to enhance network security, do not use the **`port hybrid vlan`** command to assign a hybrid port to an authorization VLAN as a tagged member.

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **`port hybrid vlan tagged`** command. Then, the VLAN has the tagged attribute on the port.

For a MAC authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as an untagged member in the VLAN.

Guest VLAN

The MAC authentication guest VLAN on a port accommodates users that have failed MAC authentication for any reason other than server unreachable. For example, the VLAN accommodates users with invalid passwords entered.

You can deploy a limited set of network resources in the MAC authentication guest VLAN. For example, a software server for downloading software and system patches.

A hybrid port is always assigned to a MAC authentication guest VLAN as an untagged member. After the assignment, do not reconfigure the port as a tagged member in the VLAN.

The device reauthenticates users in the MAC authentication guest VLAN at a specific interval. Table 3 shows the way that the network access device handles guest VLANs for MAC authentication users.

Table 3 VLAN manipulation

Authentication status	VLAN manipulation
A user in the MAC authentication guest VLAN fails MAC authentication.	The user is still in the MAC authentication guest VLAN.
A user in the MAC authentication guest VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the port.

Critical VLAN

The MAC authentication critical VLAN on a port accommodates users that have failed MAC authentication because no RADIUS authentication servers are reachable. Users in a MAC authentication critical VLAN can access only network resources in the critical VLAN.

The critical VLAN feature takes effect when MAC authentication is performed only through RADIUS servers. If a MAC authentication user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

Table 4 shows the way that the network access device handles critical VLANs for MAC authentication users.

Table 4 VLAN manipulation

Authentication status	VLAN manipulation
A user fails MAC authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the MAC authentication critical VLAN. The user is still in the MAC authentication critical VLAN if the user fails MAC reauthentication because all the RADIUS servers are unreachable. If no MAC authentication critical VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication guest VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the MAC authentication guest VLAN.
A user in the MAC authentication critical VLAN fails MAC authentication for any reason other than server unreachable.	If a guest VLAN has been configured, the device maps the MAC address of the user to the guest VLAN. If no guest VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication critical VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the access port.

Critical voice VLAN

The MAC authentication critical voice VLAN on a port accommodates MAC authentication voice users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable.

The critical voice VLAN feature takes effect when MAC authentication is performed only through RADIUS servers. If a MAC authentication voice user fails local authentication after RADIUS authentication, the user is not assigned to the critical voice VLAN. For more information about the authentication methods, see "Configuring AAA."

Table 5 shows the way that the network access device handles critical voice VLANs for MAC authentication voice users.

Table 5 VLAN manipulation

Authentication status	VLAN manipulation
A voice user fails MAC authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the voice user to the MAC authentication critical voice VLAN. The voice user is still in the MAC authentication critical voice VLAN if the voice user fails MAC reauthentication because all the RADIUS servers are unreachable. If no MAC authentication critical voice VLAN is configured, the device maps the MAC address of the voice user to the PVID of the port.
A voice user in the MAC authentication critical voice VLAN fails MAC authentication for any reason other than server unreachable.	If a guest VLAN has been configured, the device maps the MAC address of the voice user to the guest VLAN. If no guest VLAN is configured, the device maps the MAC address of the voice user to the PVID of the port.
A voice user in the MAC authentication critical voice VLAN passes MAC authentication.	The device remaps the MAC address of the voice user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the voice user on the authentication server, the device remaps the MAC address of the voice user to the PVID of the access port.

ACL assignment

You can specify an authorization ACL for a MAC authentication user on a remote server or the access device to control the user's access to network resources. After the user passes MAC authentication, the server or access device assigns the authorization ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules in the ACL.

The device supports assignment of static and dynamic authorization ACLs.

- **Assignment of static authorization ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, use one of the following methods:

  - Modify ACL rules in the authorization ACL on the access device.
  - Assign another ACL to the user as the authorization ACL from the RADIUS server or the access device.

  Static ACLs and their rules can be manually deleted from the access device.
- **Assignment of dynamic authorization ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device.

Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

If a dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **display mac-authentication connection** or **display acl** command.

IMPORTANT:

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.
- User-defined ACLs, which are numbered in the range of 5000 to 5999.

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **counting**, **established**, **fragment**, **source-mac**, **cos**, **dest-mac**, **lsap**, **vxlan**, or **logging** keyword.

For more information about ACLs, see *ACL and QoS Command Reference*.

User profile assignment

You can specify a user profile in the user account for a MAC authentication user on the authentication server to control the user's access to network resources. After the user passes MAC authentication, the authentication server assigns the user profile to the user to filter traffic for this user.

The authentication server can be the local access device or a RADIUS server. In either case, the server only specifies the user profile name. You must configure the user profile on the access device.

To change the user's access permissions, use one of the following methods:

- Modify the user profile configuration on the access device.
- Specify another user profile for the user on the authentication server.

For more information about user profiles, see "Configuring user profiles."

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server. During MAC authentication, the HTTP or HTTPS requests of a user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the MAC authentication user and uses a DM (Disconnect Message) to log off the user. When the user initiates MAC authentication again, it will pass the authentication and come online successfully.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Blackhole MAC attribute assignment

The device supports the blackhole MAC attribute assigned by the RADIUS authentication server through CoA messages for users that have passed MAC authentication. Upon receiving a CoA message that contains the blackhole MAC attribute for a user that has passed MAC authentication, the device performs the following operations:

1. Logs off the user.
2. Marks the MAC address of the user as a silent MAC address and starts a quiet timer for the MAC address.

The quiet timer is 10 minutes and is not user configurable. The device drops all packets from the MAC address after the quiet timer starts, and it will not authenticate the MAC address until the quiet timer expires.

To display silent MAC addresses, use the **`display mac-authentication`** command.

Periodic MAC reauthentication

Periodic MAC reauthentication tracks the connection status of online users, and updates the authorization attributes assigned by the RADIUS server. The attributes include the ACL and VLAN.

The device reauthenticates online MAC authentication users at the periodic reauthentication interval when the periodic MAC reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online MAC authentication users only after the old timer expires and the MAC authentication users pass authentication.

The server-assigned RADIUS Session-Timeout (attribute 27) and Termination-Action (attribute 29) attributes together can affect the periodic MAC reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **`display mac-authentication connection`** command.

- If the termination action is to log off users, periodic MAC reauthentication takes effect only when the periodic reauthentication timer is shorter than the session timeout timer. If the session timeout timer is shorter, the device logs off online authenticated users when the session timeout timer expires.
- If the termination action is to reauthenticate users, the periodic MAC reauthentication configuration on the device cannot take effect. The device reauthenticates online MAC authentication users after the server-assigned session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic MAC reauthentication depends on the periodic MAC reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether periodic MAC reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online MAC authentication users if no server is reachable for MAC reauthentication. The keep-online feature keeps authenticated MAC authentication users online when no server is reachable for MAC reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

RESTful server-assisted MAC authentication user recovery

Applicable scenario

After online dumb terminals such as printers go offline, they cannot reauthenticate to come online until after they send a service packet. This might cause the dumb terminals to stay offline for a long time after the device reboots or after their attached interfaces fail.

To avoid this situation, you can configure the device to work with the authentication server and a RESTful server to trigger MAC reauthentication for dumb terminals or retain their online state.

NOTE:

This feature is available only when you use IMC server as the authentication server and the RESTful server.

Operating mechanism

The following information describes how RESTful server-assisted MAC authentication user recovery works:

1. The authentication server includes the **shutdown-keep-online** proprietary attribute in the authorization attributes assigned to a dumb terminal after it passes authentication.
2. After receiving the authentication result from the authentication server, the device allows the dumb terminal user to come online and marks it as a dumb terminal user.
3. When a device or interface issue occurs, the device handles the dumb terminal user as follows:
   - If the interface is physical down, the device retains the online state of the dumb terminal user.
   - If the device reboots or if the interface recovers from a failure, the device obtains MAC authentication user information from the RESTful server to perform MAC reauthentication.

Restrictions and guidelines: MAC authentication configuration

When you configure MAC authentication on an interface, follow these restrictions and guidelines:

- MAC authentication is supported only on Layer 2 Ethernet interfaces that do not belong to an aggregation group.
- Do not change the link type of a port when the MAC authentication guest VLAN or critical VLAN on the port has users.

If the MAC address that has failed authentication is a static MAC address or a MAC address that has passed any security authentication, the device does not mark the MAC address as a silent address.

To ensure a successful HTTPS redirect for users to whom the RADIUS server has assigned a redirect URL, make sure VLAN interfaces exist for the VLANs that transport their packets.

MAC authentication tasks at a glance

To configure MAC authentication, perform the following tasks:

1. Enabling MAC authentication
2. Configure basic MAC authentication features
   - Specifying a MAC authentication method
   - Specifying a MAC authentication domain

- Configuring user account policy
- (Optional.) Configuring MAC authentication timers
- (Optional.) Configuring periodic MAC reauthentication

3. (Optional.) Configuring MAC authentication VLAN assignment
   - Configuring a MAC authentication guest VLAN
   - Configuring a MAC authentication critical VLAN
   - Enabling the MAC authentication critical voice VLAN feature
4. (Optional.) Configuring a MAC authentication access profile
5. (Optional.) Configuring other MAC authentication features
   - Configuring unauthenticated MAC authentication user aging
   - Configuring MAC authentication offline detection
   - Configuring packet detection for MAC authentication
   - Enabling online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available
   - Enabling online user synchronization for MAC authentication
   - Setting the maximum number of concurrent MAC authentication users on a port
   - Enabling MAC authentication multi-VLAN mode on a port

     Perform this task to not reauthenticate online users when VLAN changes occur on a port.
   - Configuring MAC authentication delay
   - Including user IP addresses in MAC authentication requests
   - Enabling parallel MAC authentication and 802.1X authentication
   - Configuring RESTful server-assisted MAC authentication user recovery
   - Tracking the availability of the Web authentication server at a redirect URL
   - Configuring Web proxy ports for URL redirection in MAC authentication
   - Logging off MAC authentication users
   - Enabling MAC authentication user logging

Prerequisites for MAC authentication

Before you configure MAC authentication, complete the following tasks:

1. Make sure the port security feature is disabled. For more information about port security, see "Configuring port security."
2. Configure an ISP domain and specify an AAA method. For more information, see "Configuring AAA."
   - For local authentication, you must also create local user accounts (including usernames and passwords) and specify the **lan-access** service for local users.
   - For RADIUS authentication, make sure the device and the RADIUS server can reach each other and create user accounts on the RADIUS server. If you are using MAC-based accounts, make sure the username and password for each account are the same as the MAC address of each MAC authentication user.

Enabling MAC authentication

Restrictions and guidelines

For MAC authentication to take effect on a port, you must enable this feature globally and on the port.

MAC authentication cannnot take effect on a port if the device has run out of ACL resources when you perform either of the following operations:

- Enable MAC authentication on the port while MAC authentication has been enabled globally.
- Enable MAC authentication globally in system while MAC authentication has been enabled on the port.

Procedure

1. Enter system view.
   system-view
2. Enable MAC authentication globally.
   mac-authentication
   By default, MAC authentication is disabled globally.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable MAC authentication on the port.
   mac-authentication
   By default, MAC authentication is disabled on a port.

Specifying a MAC authentication method

About this task

RADIUS-based MAC authentication supports the following authentication methods:

- **PAP**—Transports usernames and passwords in plain text. The authentication method applies to scenarios that do not require high security.
- **CHAP**—Transports usernames in plain text and passwords in encrypted form over the network. CHAP is more secure than PAP.

Restrictions and guidelines

The device must use the same authentication method as the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Specify an authentication method for MAC authentication.
   mac-authentication authentication-method { **chap** | **pap** }
   By default, the device uses PAP for MAC authentication.

Specifying a MAC authentication domain

About this task

By default, MAC authentication users are in the system default authentication domain. To implement different access policies for users, you can use one of the following methods to specify authentication domains for MAC authentication users:

- Specify a global authentication domain in system view. This domain setting applies to all ports enabled with MAC authentication.
- Specify an authentication domain for an individual port in interface view.

MAC authentication chooses an authentication domain for users on a port in this order: the port-specific domain, the global domain, and the default domain. For more information about authentication domains, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view

2. Specify an authentication domain for MAC authentication users.
   - In system view:

     mac-authentication domain *domain-name*
   - In interface view:

     interface *interface-type interface-number*

     mac-authentication domain *domain-name*

   By default, the system default authentication domain is used for MAC authentication users.

Configuring user account policy

Restrictions and guidelines

For users in a MAC address range, the MAC address range-specific user account has higher priority than the global user account settings.

You can configure a maximum of 16 MAC address ranges and must make sure the MAC address ranges do not overlap.

If you configure user account settings multiple times for the same MAC address range, the most recent configuration overwrites the previous configuration.

The MAC range-specific accounts apply only to unicast MAC addresses.

- If you specify a MAC address range that contains only multicast MAC addresses, execution of this command will fail.
- If you specify a MAC address range that contains both unicast and multicast MAC addresses, the command takes effect only on unicast MAC addresses.

The all-zero MAC address is invalid for MAC authentication. Users with the all-zero MAC address cannot pass MAC authentication.

Procedure

1. Enter system view.

   system-view

2. Configure the global MAC authentication user account policy.
   - Use one MAC-based user account for each user.

     mac-authentication user-name-format mac-address [{ **with-hyphen** [**separator colon**] | **without-hyphen** } [**lowercase** | **uppercase**]] [**password** { **cipher** | **simple** } *string*]
   - Use one shared user account for all users.

     mac-authentication user-name-format fixed [**account** *name*] [**password** { **cipher** | **simple** } *string*]

   By default, the device uses the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation without hyphens, and letters are in lower case.
3. Specify one shared user account specific to a MAC address range.

mac-authentication mac-range-account mac-address *mac-address* **mask** { *mask* | *mask-length* } **account** *name* **password** { **cipher** | **simple** } *string*

By default, no username or password is configured specific to a MAC address range. The global user account policy applies to the users.

Configuring MAC authentication timers

About this task

MAC authentication uses the following timers:

- **Offline detection timer**—Sets the interval that the device must wait for traffic from a user before the device determines that the user is idle. If the device has not received traffic from a user before the timer expires, the device logs off that user and requests the accounting server to stop accounting for the user. This timer takes effect only when the MAC authentication offline detection feature is enabled.

  As a best practice, set the MAC address aging timer to the same value as the offline detection timer. This operation prevents a MAC authenticated user from being logged off within the offline detection interval because of MAC address entry expiration.
- **Quiet timer**—Sets the interval that the device must wait before the device can perform MAC authentication for a user that has failed MAC authentication. All packets from the MAC address are dropped during the quiet time. This quiet mechanism prevents repeated authentication from affecting system performance.
- **Server timeout timer**—Sets the interval that the device waits for a response from a RADIUS server before the device determines that the RADIUS server is unavailable. If the timer expires during MAC authentication, the user fails MAC authentication.
- **Aging timer for temporary MAC authentication users**—Sets the aging timer for temporary MAC authentication users. This timer starts when a user passes MAC authentication on a port operating in **macAddressAndUserLoginSecureExt** mode. If the device has not received 802.1X protocol packets from the MAC authenticated user on that port before the timer expires, the device determines that the user has failed authentication. Then, the device logs off the user. For more information about the port security mode, see "Configuring port security."

Restrictions and guidelines

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view
2. Configure MAC authentication timers.

   mac-authentication timer { **offline-detect** *offline-detect-value* | **quiet** *quiet-value* | **server-timeout** *server-timeout-value* | **temporary-user-aging** *aging-time-value* }

   The default settings are as follows:
   - The offline detection timer is 300 seconds.
   - The quiet timer is 60 seconds.

- The server timeout timer is 100 seconds.
- The temporary user aging timer is 60 seconds.

Configuring periodic MAC reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for MAC reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

Modification to the MAC authentication domain, MAC authentication method, or user account format setting does not affect the reauthentication of online MAC authentication users. The modified setting takes effect only on MAC authentication users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view

2. Set the periodic MAC reauthentication timer.
   - Set a global periodic reauthentication timer.

     mac-authentication timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.
   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     mac-authentication timer reauth-period *reauth-period-value*

     quit

     By default, no periodic MAC reauthentication timer is set on a port. The port uses the global periodic MAC reauthentication timer.
3. Enter interface view.

   interface *interface-type interface-number*

4. Enable periodic MAC reauthentication.

   mac-authentication re-authenticate

   By default, periodic MAC reauthentication is disabled on a port.

5. (Optional.) Enable the keep-online feature for MAC authenticated users on the port.

   mac-authentication re-authenticate server-unreachable keep-online

   By default, the keep-online feature is disabled. The device logs off online MAC authentication users if no server is reachable for MAC reauthentication.

   In a fast-recovery network, you can use the keep-online feature to prevent MAC authentication users from coming online and going offline frequently.

Configuring a MAC authentication guest VLAN

Specifying a MAC authentication guest VLAN on a port

Restrictions and guidelines

To have a VLAN act as the MAC authentication guest VLAN for a port, make sure that VLAN is not specified as a free VLAN for port security.

When you configure the MAC authentication guest VLAN on a port, follow the guidelines in Table 6.

Table 6 Relationships of the MAC authentication guest VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication guest VLAN feature has higher priority. When a user fails MAC authentication, the user can access the resources in the guest VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The guest VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication guest VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication guest VLAN.
- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Specify the MAC authentication guest VLAN on the port.
   `mac-authentication guest-vlan` *`guest-vlan-id`*

   By default, no MAC authentication guest VLAN is specified on a port.

   You can configure only one MAC authentication guest VLAN on a port. The MAC authentication guest VLANs on different ports can be different.

Enabling guest VLAN reauthentication in MAC authentication

About this task

The guest VLAN reauthentication feature of MAC authentication enables the device to reauthenticate users in the MAC authentication guest VLAN on a port at reauthentication intervals.

By default, this feature is enabled. You can disable it as needed to suppress excessive authentication failure log messages, which might occur when a network issue results in a large number of reauthentication failures.

If guest VLAN reauthentication is disabled on a port, the device does not reauthenticate users in the MAC authentication guest VLAN on the port. The guest VLAN users will stay in the guest VLAN until they age out. To control guest VLAN user aging functionality, use the **mac-authentication unauthenticated-user aging enable** command. To configure the aging timer, use the **mac-authentication timer user-aging guest-vlan** *aging-time-value* command.

Restrictions and guidelines

As a best practice, set the reauthentication interval to a value greater than 30 seconds if the number of concurrent MAC authentication users on a port is likely to exceed 300.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the guest VLAN reauthentication feature of MAC authentication on the port.
   mac-authentication guest-vlan re-authenticate
   By default, the guest VLAN reauthentication feature of MAC authentication is enabled on a port.
4. Set the authentication interval for users in the MAC authentication guest VLAN.
   mac-authentication guest-vlan auth-period *period-value*
   The default setting is 30 seconds.

Configuring a MAC authentication critical VLAN

Restrictions and guidelines

To have a VLAN act as the MAC authentication critical VLAN for a port, make sure that VLAN is not specified as a free VLAN for port security.

When you configure the MAC authentication critical VLAN on a port, follow the guidelines in Table 7.

Table 7 Relationships of the MAC authentication critical VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication critical VLAN feature has higher priority. When a user fails MAC authentication because no RADIUS authentication server is reachable, the user can access the resources in the critical VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The critical VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication critical VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication critical VLAN.

- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify the MAC authentication critical VLAN on the port.

   mac-authentication critical vlan *critical-vlan-id* [**url-user-logoff**]

   By default, no MAC authentication critical VLAN is specified on a port.

   You can configure only one MAC authentication critical VLAN on a port. The MAC authentication critical VLANs on different ports can be different.

Enabling the MAC authentication critical voice VLAN feature

Prerequisites

Before you enable the MAC authentication critical voice VLAN feature on a port, complete the following tasks:

- Enable LLDP both globally and on the port.

  The device uses LLDP to identify voice users. For information about LLDP, see *Layer 2—LAN Switching Configuration Guide*.
- Enable voice VLAN on the port.

  For information about voice VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- Specify a MAC authentication critical VLAN on the port. This setting ensures that a voice user is assigned to the critical VLAN if it has failed authentication for unreachability of RADIUS servers before the device recognizes it as a voice user. If a MAC authentication critical VLAN is not available, the voice user might be logged off instead.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the MAC authentication critical voice VLAN feature on a port.

   mac-authentication critical-voice-vlan

   By default, the MAC authentication critical voice VLAN feature is disabled on a port.

Configuring a MAC authentication access profile

About this task

The device uses MAC authentication access profiles to uniformly manage configurations related to MAC authentication access. After you bind a MAC authentication access profile to a port security authentication profile, the interface bound to the port security authentication profile will use the access profile's configuration to authenticate users.

After you bind a port security authentication profile to an interface:

- For settings that can be configured both in interface view and MAC authentication access profile view (the command lines might differ in the views), the system automatically deletes the settings in interface view regardless of whether the port security authentication profile has been bound to a MAC authentication access profile. To use these settings, configure them in the MAC authentication access profile bound to the port security authentication profile.
- For settings supported in interface view but not in MAC authentication access profile view, the settings in interface view still take effect.

For more information about port security authentication profiles, see "Configuring port security."

Restrictions and guidelines

If a MAC authentication access profile bound to a port security authentication profile has taken effect, deleting the access profile will cause users who have come online using this access profile to disconnect abnormally.

A MAC authentication access profile can be bound to multiple port security authentication profiles, but a port security authentication profile can be bound to only one MAC authentication access profile. To bind another MAC authentication access profile to a port security authentication profile, you must first unbind the existing one.

Procedure

1. Enter system view.

   system-view

2. Create a MAC authentication access profile and enter its view.

   mac-authentication access-profile name *profile-name*

   By default, no MAC authentication access profiles exist.

3. Configure supported MAC authentication features as needed.

   Only some MAC authentication features are supported in MAC authentication access profile view. For more information, see the command reference.

4. Enter a port security authentication profile view.

   port-security authentication-profile name *profile-name*

5. Bind the MAC authentication access profile to the port security authentication profile.

   mac-authentication access-profile *profile-name*

   By default, no MAC authentication access profile is bound to the port security authentication profile.

Configuring unauthenticated MAC authentication user aging

About this task

Unauthenticated MAC authentication user aging applies to users added to a MAC authentication guest or critical VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

Restrictions and guidelines

Users removed from an access control segment upon aging timer expiration will be unable to access the network resources for that segment until after another authentication is triggered. As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.

   system-view

2. Set the user aging timer for a type of MAC authentication VLAN.

   mac-authentication timer user-aging { **critical-vlan** | **guest-vlan** } *aging-time-value*

   By default, the user aging timer is 1000 seconds for all applicable types of MAC authentication VLANs.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable unauthenticated MAC authentication user aging.

   mac-authentication unauthenticated-user aging enable

   By default, unauthenticated MAC authentication user aging is enabled.

Configuring MAC authentication offline detection

About this task

Enable MAC authentication offline detection to detect idle users on a port. If the port has not received traffic from a user when the offline detection timer expires, the device logs off that user and requests the accounting server to stop accounting for the users. For information about setting the offline detection timer in system view, see "Configuring MAC authentication timers."

Disabling this feature disables the device from inspecting the online user status.

In addition to port-based MAC authentication offline detection, you can configure offline detection parameters on a per-user basis, as follows:

- Set an offline detection timer specific to a user and control whether to use the ARP snooping or ND snooping table to determine the offline state of the user.
  - If the ARP snooping or ND snooping table is used, the device searches the ARP snooping or ND snooping table before it checks for traffic from the user within the detection interval. If a matching ARP snooping or ND snooping entry is found, the device resets the offline detection timer and the user stays online. If the offline detection timer expires because the

device has not found a matching snooping entry for the user or received traffic from the user, the device disconnects the user.

- If the ARP or ND snooping table is not used, the device disconnects the user if it has not received traffic from that user before the offline detection timer expires.

When disconnecting the user, the device also notifies the RADIUS server (if any) to stop user accounting.

- Skip offline detection for the user. You can choose this option if the user is a dumb terminal. A dumb terminal might fail to come online again after it is logged off by the offline detection feature.

The device uses the offline detection settings for a user in the following sequence:

1. User-specific offline detection settings.
2. Offline detection settings assigned to the user by the RADIUS server. The settings include the offline detection timer, use of the ARP or ND snooping table in offline detection, and whether to ignore offline detection.
3. Port-based offline detection settings.

MAC authentication offline detection takes effect on both of the following types of users:

- Users in preauthentication domains, authentication domains, critical domains, and Auth-Fail domains.
- Users assigned to guest VLANs and critical VLANs.

Restrictions and guidelines

For the user-specific offline detection feature to take effect on a user, make sure the MAC authentication offline detection feature is enabled on the user's access port.

The user-specific offline detection settings take effect on the online users immediately after they are configured.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure MAC authentication offline detection for a user.

   mac-authentication offline-detect mac-address *mac-address* { **ignore** | **timer** *offline-detect-value* [**check-arp-or-nd-snooping**] }

   By default, offline detection settings configured on access ports take effect and the offline detection timer set in system view is used.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable MAC authentication offline detection.

   mac-authentication offline-detect enable

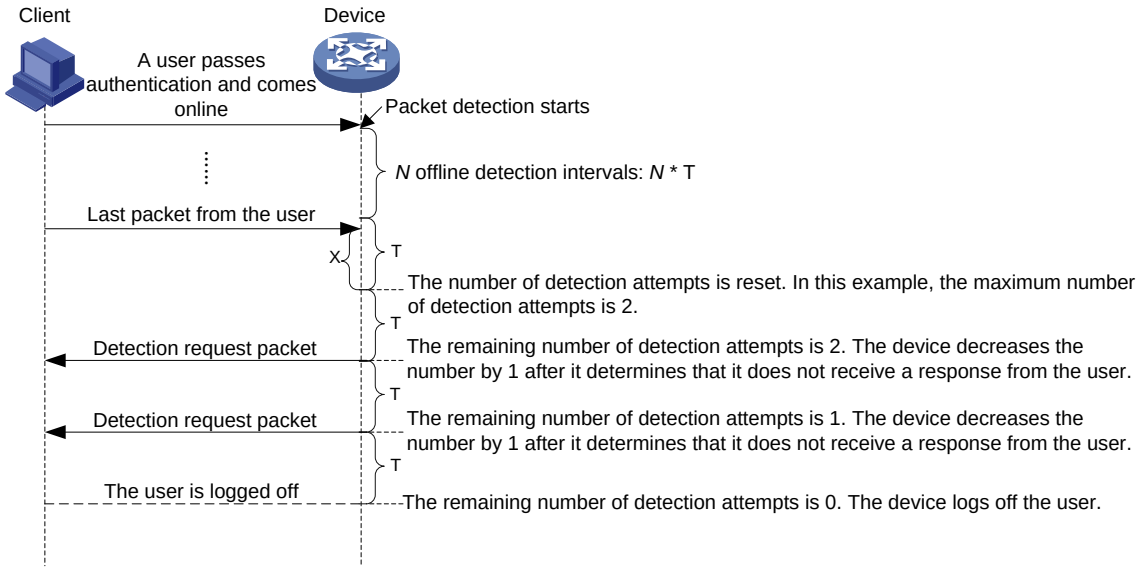
   By default, MAC authentication offline detection is enabled on a port.

Configuring packet detection for MAC authentication

About this task

When packet detection for MAC authentication is enabled on a port, the device sends detection packets to MAC authentication users connected to that port at offline detection intervals set by using the offline detection timer. If the device does not receive a response from a user after it has made the

maximum packet transmission attempts within an offline detection interval, it logs off that user and requests the RADIUS server to stop accounting for the user.



When packet detection for MAC authentication and MAC authentication offline detection are both enabled, the device processes a MAC authentication user as follows:

- If MAC authentication offline detection determines that a user is online, the device does not send detection packets to that user.
- If MAC authentication offline detection determines that a user is offline, the device does not immediately logs off that user. Instead, the device sends a detection packet to that user. It will log off that user if it does not receive a response from that user after it has made the maximum packet transmission attempts within an offline detection interval.

MAC authentication uses ARP request packets to detect the online status of IPv4 users and uses NS packets to detect the online status of IPv6 users.

Packet detection adopts the principle of counting prior to judging. The device decreases the detection attempts (packet transmission attempts) by 1 only after it determines that it does not receive a response from a user. The device stops the detection process when the number of detection attempts becomes 0. The duration from the time when the user sends the last packet to the time when the user is logged off is calculated by using the following formula: duration = (*retries* + 1) * T + X. Figure 4 shows the packet detection process. In this example, the device sends a detection packet to a MAC authentication user for a maximum of two times.

Figure 4 Network diagram for packet detection process

The duration from the time when the user sends the last packet to the time when the user is logged off equals to 3 * T + X.

Packet detection for MAC authentication takes effect on both of the following types of users:

- Users in preauthentication domains, authentication domains, critical domains, and Auth-Fail domains.
- Users assigned to guest VLANs and critical VLANs.

Restrictions and guidelines

To ensure that the device is aware of user IP address changes, enable ARP snooping and ND snooping in conjunction with packet detection for MAC authentication. If you do not enable ARP snooping or ND snooping, the device is unaware of user IP address changes. As a result, the device still sends detection packets to the users' original IP addresses and falsely log off these users.

Procedure

1. Enter system view.

system-view

2. Set the offline detection timer.

   mac-authentication timer offline-detect *offline-detect-value*

   By default, the offline detection timer expires in 300 seconds.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable packet detection for MAC authentication.

   mac-authentication packet-detect enable

   By default, packet detection for MAC authentication is disabled.

5. Set the maximum number of attempts for sending a detection packet to a MAC authentication user.

   mac-authentication packet-detect retry *retries*

   By default, the device sends a detection packet to a MAC authentication user for a maximum of two times.

Enabling online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available

About this task

The offline detection feature for MAC authentication logs off an online MAC authentication user if it has not detected traffic from that user before the offline-detect timer expires. To prevent online MAC authentication users on a port from being forced offline by the offline detection feature and stay online when none of the RADIUS servers in their ISP domain is reachable, perform this task.

Restrictions and guidelines

Use this feature only when RADIUS scheme authentication is configured for the MAC authentication users on a port. If local or no authentication is also configured, offline detection might be undesirably disabled for MAC authentication users that come online through local authentication or without authentication.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available.

   mac-authentication auth-server-unavailable escape

   By default, online MAC authentication users cannot escape from offline detection (if enabled) when no reachable RADIUS authentication servers are available.

Enabling online user synchronization for MAC authentication

About this task

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate MAC authentication users.

To ensure that the RADIUS server maintains the same online MAC authentication user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online MAC authentication user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online MAC authentication user information on a port with the RADIUS server, the device initiates MAC authentication in turn for each authenticated online MAC authentication user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new MAC authentication users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **`radius-server test-profile`** command. For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable online user synchronization for MAC authentication.
   `mac-authentication server-recovery online-user-sync`
   By default, online user synchronization for MAC authentication is disabled.

Setting the maximum number of concurrent MAC authentication users on a port

About this task

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.

interface *interface-type interface-number*

3. Set the maximum number of concurrent MAC authentication users on the port.

   mac-authentication max-user [**preauth-domain** | **auth-fail-domain**] *max-number*

   The default setting is 4294967295.

Enabling MAC authentication multi-VLAN mode on a port

About this task

By default, MAC authentication single-VLAN mode applies on a port. In this mode, traffic from an online user cannot be sent in different VLANs on a port without service interruption. To accommodate applications that are sensitive to delay or service interruption in a multi-VLAN environment, for example, IP phones, enable MAC authentication multi-VLAN mode.

In multi-VLAN mode, the port forwards traffic from a user in different VLANs without reauthentication if the user has been authenticated and come online in any VLAN on the port. Free of reauthentication, traffic from an online user can be sent in different VLANs without delay or service interruption.

In single-VLAN mode, the port reauthenticates an online user when traffic received from that user contains a VLAN tag different from the VLAN in which the user was authenticated. The authentication process differs depending on the MAC move setting in port security and the authorization VLAN assignment status, as follows:

- If no authorization VLAN has been assigned to the online user, the device first logs off the user and then reauthenticates the user in the new VLAN.
- If the online user has been assigned an authorization VLAN, the device handles the user depending on the MAC move setting in port security.
  - If MAC move is disabled in port security, the user cannot pass authentication and come online from the new VLAN until after it goes offline from the port.
  - If MAC move is enabled in port security, the user can pass authentication on the new VLAN and come online without having to first go offline from the port. After the user passes authentication on the new VLAN, the original authentication session of the user is deleted from the port.

To enable the port security MAC move feature, use the **port-security mac-move permit** command.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable MAC authentication multi-VLAN mode.

   mac-authentication host-mode multi-vlan

   By default, MAC authentication operates in single-VLAN mode on a port.

Configuring MAC authentication delay

About this task

When both 802.1X authentication and MAC authentication are enabled on a port, you can delay MAC authentication so that 802.1X authentication is preferentially triggered.

If no 802.1X authentication is triggered or 802.1X authentication fails within the delay period, the port continues to process MAC authentication.

Restrictions and guidelines

Do not set the port security mode to **mac-else-userlogin-secure** or **mac-else-userlogin-secure-ext** when you use MAC authentication delay. The delay does not take effect on a port in either of the two modes. For more information about port security modes, see "Configuring port security."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MAC authentication delay and set the delay timer.
   mac-authentication timer auth-delay *time*
   By default, MAC authentication delay is disabled.

Including user IP addresses in MAC authentication requests

About this task

IMPORTANT:
This feature can only operate in conjunction with an IMC server.

To avoid IP conflicts that result from changes to static IP addresses, use this feature on a port that has MAC authentication users with static IP addresses.

This feature adds user IP addresses to the MAC authentication requests sent to the authentication server. When MAC authentication is triggered for a user, the device checks the user's IP address for invalidity.

- If the IP address is valid, the device sends a MAC authentication request with the IP address included.
- If the IP address is not a valid host IP address or the triggering packet does not contain an IP address, the device does not initiate MAC authentication.
- If the packet is a DHCP packet with a source IP address of all zeros, the device sends a MAC authentication request without including the IP address. In this case, the IMC server does not examine the user IP address when it performs authentication.

Upon receipt of the authentication request that includes a user's IP address, the IMC server compares the user's IP and MAC addresses with its local IP-MAC mappings.

- If an exact match is found or if no match is found, the user passes MAC authentication. In the latter case, the server creates an IP-MAC mapping for the user.

- If a mapping is found for the MAC address but the IP addresses do not match, the user fails the MAC authentication.

After you specify the **exclude-ip acl** keyword, the applied ACL cannot filter out DHCP packets. If a DHCP packet that carries an invalid IP address triggers MAC authentication, user authentication will fail. To resolve this issue, you can specify the **exclude-dhcpv4** or **exclude-dhcpv6** keyword to prevent users from triggering MAC authentication through DHCP packets.

Restrictions and guidelines

Configure DHCP snooping or ARP snooping, so when users' IP addresses change, the device can quickly update the users' IP addresses and send authentication requests with correct user IP addresses to the authentication server. To configure DHCP snooping, execute the **dhcp snooping enable** and **dhcp snooping binding record** commands. To enable ARP snooping, execute the **arp snooping enable** command. For more information about DHCP snooping and ARP snooping, see ARP configuration and DHCP configuration respectively in *Layer 3—IP Services Configuration Guide*.

Do not use this feature in conjunction with the MAC authentication guest VLAN on a port. If both features are used, the device cannot perform MAC authentication for a user once that user is added to the MAC authentication guest VLAN.

You can specify an ACL to identify source IP addresses that can or cannot trigger MAC authentication. When you configure the ACL, follow these guidelines:

- The specified ACL number represents an IPv4 ACL and an IPv6 ACL with the same number. For example, if the ACL number is 2000, you specify both IPv4 ACL 2000 and IPv6 ACL 2000. The IPv4 ACL and the IPv6 ACL will be used to process IPv4 packets and IPv6 packets, respectively.
- Use permit rules to identify source IP addresses that are valid for MAC authentication. Use deny rules to identify source IP addresses that cannot trigger MAC authentication.
- In the rules, only the action keyword (permit or deny) and the source IP match criteria can take effect. If the ACL is a user-defined ACL (numbered in the range of 5000 to 5999), only the **ipv4**, **ipv6**, and **any** source IP match criteria can take effect.
- As a best practice, configure a deny rule to exclude the IPv6 IP addresses that start with fe80 from triggering MAC authentication.
- If you configure permit rules, add a **deny all** rule at the bottom of the ACL.

IMPORTANT:

If the user host is configured with IPv6, the device might receive packets that contain an IPv6 link-local address, which starts with fe80. MAC authentication failure or incorrect MAC-IP binding will occur if this address is used in MAC authentication. To avoid these issues, configure an ACL to exclude the IPv6 IP addresses that start with fe80.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Include user IP addresses in MAC authentication requests.

   mac-authentication carry user-ip [**exclude-ip acl** *acl-number*] [**exclude-dhcpv4**] [**exclude-dhcpv6**]

   By default, a MAC authentication request does not include the user IP address.

Enabling parallel MAC authentication and 802.1X authentication

About this task

This feature enables a port to perform MAC authentication in parallel with 802.1X authentication when it receives a packet from an unknown MAC address.

This feature applies to the following situation in which MAC authentication can be performed only after 802.1X authentication is completed:

- The port is configured with both 802.1X authentication and MAC authentication and performs MAC-based access control for 802.1X authentication.
- The port is enabled with the 802.1X unicast trigger.

With parallel authentication enabled, the port performs MAC authentication while sending a unicast EAP-Request/Identity packet to trigger 802.1 authentication when it receives a packet from an unknown MAC address.

If MAC authentication succeeds before 802.1X authentication is completed, the port is assigned to the MAC authentication authorization VLAN. When 802.1X authentication completes, the device manipulates VLAN assignment depending on the authentication result, as follows:

- If 802.1X authentication fails, the MAC authentication result takes effect.
- If 802.1X authentication succeeds, the device manipulates VLAN assignment based on the 802.1X authentication result.

For the port to perform MAC authentication before it is assigned to the 802.1X guest VLAN, you must also enable new MAC-triggered 802.1X guest VLAN assignment delay. For information about new MAC-triggered 802.1X guest VLAN assignment delay, see "Configuring 802.1X."

Restrictions and guidelines

To configure both 802.1X authentication and MAC authentication on a port, use one of the following methods:

- Enable the 802.1X and MAC authentication features separately on the port.
- Enable port security on the port. The port security mode must be **userlogin-secure-or-mac** or **userlogin-secure-or-mac-ext**.

  For information about port security mode configuration, see "Configuring port security."

For the parallel authentication feature to work correctly, do not enable MAC authentication delay on the port. This feature will delay MAC authentication after 802.1X authentication is triggered.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable parallel MAC authentication and 802.1X authentication on the port.

   mac-authentication parallel-with-dot1x

   By default, this feature is disabled.

Configuring RESTful server-assisted MAC authentication user recovery

About this task

RESTful server-assisted MAC authentication user recovery supports the following methods:

- **Automatic recovery**—The device automatically obtains MAC authentication user information and performs a reauthentication after the device reboots or after an interface recovers from a failure. This feature recovers the online state of MAC authenticated users quickly without waiting for packets from the MAC authentication users to trigger a reauthentication. It is helpful when the network has a large number of dumb terminals or the operation of dumb terminals is important for services.
- **Manual recovery**—You trigger a recovery manually. Then, the device obtains MAC authentication user information from the RESTful server and performs reauthentication. This method is helpful when automatic recovery fails to recover the online state of all MAC authenticated users because of link flapping.

With this feature, you can configure a maximum of 16 profiles for MAC authentication user recovery. Each profile contains a set of parameters for accessing a RESTful server and the URI from which you obtain MAC authentication user information.

Restrictions and guidelines

To use this feature, you must use an IMC server to act as both authentication and RESTful servers.

This feature is mutually exclusive with the RADIUS accounting-on feature. Do not use the two features together. For more information about the RADIUS accounting-on feature, see "Configuring AAA."

To ensure that the MAC authentication user entries obtained from the RESTful server contain user IP addresses, configure the device to include user IP addresses in the MAC authentication requests sent to the authentication server. For more information about this feature, see "Including user IP addresses in MAC authentication requests."

Procedure

1. Enter system view.

   system-view

2. Configure a MAC authentication user-recovery profile:

   a. Create a profile for MAC authentication user recovery and enter its view.

      mac-authentication user-recovery-profile *profile-name*

   b. Configure the IP address and port number of the RESTful server.

      server-address { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]

      By default, no RESTful servers are configured.

   c. Configure the username and password for accessing the RESTful server.

      login-name *username* [**password** { **cipher** | **simple** } *string*]

      By default, no username or password is configured for accessing the RESTful server.

   d. Configure the NAS IP address used by the device to communicate with the RESTful server.

      nas-ip { *ipv4-address* | **ipv6** *ipv6-address* }

      By default, no NAS IP address is configured for the device to communicate with the RESTful server.

      The NAS IP address must be the same as that configured in the authentication RADIUS scheme for the MAC authentication users.

e. Specify the URI for obtaining MAC authentication user information from the RESTful server.

uri *uri-string*

By default, no URIs are specified.

The URI can only be **imcrs/uam/online/notAgingMuteTerminal**. Other URIs cannot take effect.

3. Return to system view.

quit

4. Enable automatic MAC authentication user recovery.

mac-authentication auto-recover-user profile *profile-name*

By default, automatic MAC authentication user recovery is disabled.

5. Return to user view.

quit

6. (Optional.) Manually recover MAC authentication users.

mac-authentication recover-user profile *profile-name* [**interface** *interface-type interface-number*

Tracking the availability of the Web authentication server at a redirect URL

About this task

By default, the device does not track the availability of the Web authentication server at the redirect URL assigned to MAC authentication users. On the device, the state of the Web authentication server will always be active, regardless of its availability. To have the MAC authentication module log off MAC authentication users that have been assigned a redirect URL promptly when the Web authentication server at that URL becomes unavailable, associate that redirect URL with a track entry to detect its connectivity.

As a best practice, configure the track entry associated with the redirect URL to collaborate with an HTTP NQA operation for detection. For more information about Track, see *High Availability Configuration Guide*. For more information about NQA, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

system-view

2. Associate a redirect URL for MAC authentication users with a track entry.

mac-authentication redirect-url *url-string* **track** *track-entry-number*

By default, no redirect URLs for MAC authentication users are associated with a track entry.

Configuring Web proxy ports for URL redirection in MAC authentication

About this task

By default, the device redirects the HTTP or HTTPS requests from a MAC authenticated user to the authorized URL only if the requests are sent from a browser with Web proxy disabled. The device discards these requests if they are sent from a browser configured with a Web proxy.

To prevent the HTTP or HTTPS requests from being discarded, add the TCP port numbers of the Web proxy for HTTP and HTTPS to the device. These TCP port numbers are called Web proxy ports in this document.

Restrictions and guidelines

You can configure a maximum of 64 Web proxy ports for MAC authenticated users.

Specify different Web proxy port numbers for HTTP and HTTPS requests.

Adding or removing a Web proxy port will cause the device to log off all online MAC authenticated users that have been assigned an authorization redirect URL.

Procedure

1. Enter system view.

   system-view

2. Specify a Web proxy port used by MAC authentication users for HTTP or HTTPS.

   mac-authentication web-proxy { **http** | **https** } **port** *port-number*

   By default, no Web proxy ports are specified.

Logging off MAC authentication users

About this task

Perform this task to log off specified MAC authentication users and clear information about these users from the device. These users must perform MAC authentication to come online again.

Procedure

To log off MAC authentication users, execute the following command in user view:

reset mac-authentication access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** | **url-unavailable-domain** } | **username** *username* | **vlan** *vlan-id*]

Enabling MAC authentication user logging

About this task

This feature enables the device to generate logs about MAC authentication users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive MAC authentication user log entries, use this feature only if you need to analyze abnormal MAC authentication user logins or logouts.

To have MAC authentication user logging take effect on an interface, make sure this feature is enabled both in system view and interface view.

Procedure

1. Enter system view.

   system-view

2. Enable MAC authentication user logging globally.

mac-authentication access-user log enable [**failed-login** | **ip-change** | **logoff** | **successful-login**] *

By default, all types of MAC authentication user logs are disabled globally.

If you do not specify any parameters, this command enables all types of MAC authentication user logs.

3. (Optional.) Disable MAC authentication user logging on an interface.
   a. Enter interface view.
      interface *interface-type interface-number*
   b. Disable MAC authentication user logging on the interface.
      undo mac-authentication access-user log enable [**failed-login** | **ip-change** | **logoff** | **successful-login**] *
      By default, all types of MAC authentication user logs are enabled on an interface.

Display and maintenance commands for MAC authentication

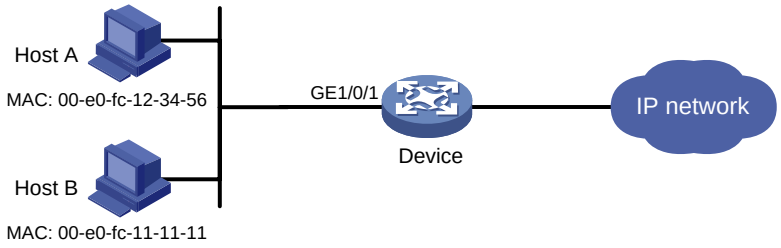
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display MAC authentication information.	**display mac-authentication** [**interface** *interface-type interface-number*]
Display configuration information for MAC authentication access profiles.	**display mac-authentication access-profile** [**name** *profile-name*]
Display MAC authentication connections.	**display mac-authentication connection** [**open**] [[**interface** *interface-type interface-number* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** | **url-unavailable-domain** } | **slot** *slot-number* | **user-name** *user-name*] | **user-mac** *mac-address*]
Display the MAC addresses of MAC authentication users in a type of MAC authentication VLAN.	**display mac-authentication mac-address** { **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Clear MAC authentication statistics.	**reset mac-authentication statistics** [**interface** *interface-type interface-number*]

Task	Command
Remove users from the MAC authentication critical VLAN on a port.	**reset mac-authentication critical vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Remove users from the MAC authentication critical voice VLAN on a port.	**reset mac-authentication critical-voice-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Remove users from the MAC authentication guest VLAN on a port.	**reset mac-authentication guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]

MAC authentication configuration examples

Example: Configuring local MAC authentication



Network configuration

As shown in Figure 5, the device performs local MAC authentication on GigabitEthernet 1/0/1 to control Internet access of users.

Configure the device to meet the following requirements:

- Detect whether a user has gone offline every 180 seconds.
- Deny a user for 180 seconds if the user fails MAC authentication.
- Authenticate all users in ISP domain **bbb**.
- Use the MAC address of each user as both the username and password for authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

Figure 5 Network diagram

Procedure

Add a network access local user. In this example, configure both the username and password as Host A's MAC address 08-00-27-12-34-56.

```
<Device> system-view
[Device] local-user 08-00-27-12-34-56 class network
[Device-luser-network-08-00-27-12-34-56] password simple 08-00-27-12-34-56
```

Specify the LAN access service for the user.

```
[Device-luser-network-08-00-27-12-34-56] service-type lan-access
[Device-luser-network-08-00-27-12-34-56] quit
```

Configure ISP domain **bbb** to perform local authentication for LAN users.

```
[Device] domain bbb
[Device-isp-bbb] authentication lan-access local
[Device-isp-bbb] quit
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Specify ISP domain **bbb** as the MAC authentication domain.

```
[Device] mac-authentication domain bbb
```

Configure MAC authentication timers.

```
[Device] mac-authentication timer offline-detect 180
[Device] mac-authentication timer quiet 180
```

Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Display MAC authentication settings and statistics to verify your configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                  : Enabled

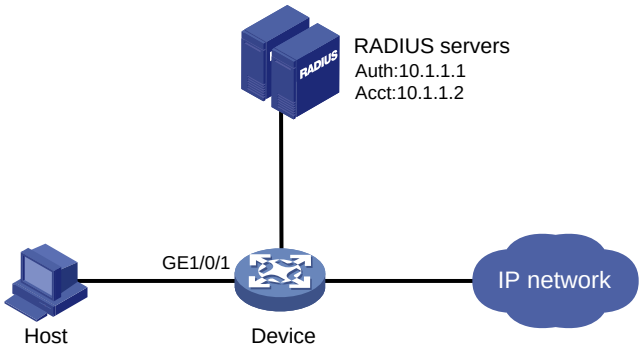
VLAN tag configuration ignoring             : Disabled
Max online users                            : 4294967295
Max online preauth-domain users             : 4294967295
Max online Auth-Fail-domain users           : 4294967295
Auth-server-unavailable escape              : Enabled
Authentication attempts                     : successful 1, failed 0
Current online users                        : 1
       MAC address       Auth state
       0800-2712-3456    Authenticated
```

The output shows that Host A has passed MAC authentication and has come online. Host B failed MAC authentication and its MAC address is marked as a silent MAC address.

Example: Configuring RADIUS-based MAC authentication



Network configuration

As shown in Figure 6, the device uses RADIUS servers to perform authentication, authorization, and accounting for users. The RADIUS servers use the CHAP authentication method.

To control user access to the Internet by MAC authentication, perform the following tasks:

- Enable MAC authentication globally and on GigabitEthernet 1/0/1.
- Configure the device to use CHAP for MAC authentication.
- Configure the device to detect whether a user has gone offline every 180 seconds.
- Configure the device to deny a user for 180 seconds if the user fails MAC authentication.
- Configure all users to belong to ISP domain **bbb**.
- Use a shared user account for all users, with username **aaa** and password **123456**.

Figure 6 Network diagram

Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Create a shared account with username **aaa** and password **123456** for MAC authentication users. (Details not shown.)
2. Configure RADIUS-based MAC authentication on the device:

   # Configure a RADIUS scheme.

   ```
   <Device> system-view
   [Device] radius scheme 2000
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   [Device-radius-2000] key authentication simple abc
   [Device-radius-2000] key accounting simple abc
   [Device-radius-2000] user-name-format without-domain
   [Device-radius-2000] quit
   ```

   # Specify CHAP as the authentication method for MAC authentication.

   ```
   [Device] mac-authentication authentication-method chap
   ```

   # Apply the RADIUS scheme to ISP domain **bbb** for authentication, authorization, and accounting.

   ```
   [Device] domain bbb
   [Device-isp-bbb] authentication default radius-scheme 2000
   [Device-isp-bbb] authorization default radius-scheme 2000
   [Device-isp-bbb] accounting default radius-scheme 2000
   [Device-isp-bbb] quit
   ```

   # Enable MAC authentication on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] mac-authentication

Example: Configuring ACL assignment for MAC authentication

Network configuration

As shown in Figure 7, configure the device to meet the following requirements:

- Use RADIUS servers to perform authentication, authorization, and accounting for users.
- Perform MAC authentication on GigabitEthernet 1/0/1 to control Internet access.
- Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.
- Use an ACL to deny authenticated users to access the FTP server at 10.0.0.1.

Figure 7 Network diagram

Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers:

   # Configure the RADIUS servers to provide authentication, authorization, and accounting services. (Details not shown.)

   # Add a user account with **08-00-27-12-34-56** as both the username and password on each RADIUS server. (Details not shown.)

   # Specify ACL 3000 as the authorization ACL for the user account. (Details not shown.)

2. Configure ACL 3000 to deny packets destined for 10.0.0.1 on the device.

   ```
   <Device> system-view
   ```

```
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

3. Configure RADIUS-based MAC authentication on the device:

Configure a RADIUS scheme.

```
[Device] radius scheme 2000
[Device-radius-2000] primary authentication 10.1.1.1 1812
[Device-radius-2000] primary accounting 10.1.1.2 1813
[Device-radius-2000] key authentication simple abc
[Device-radius-2000] key accounting simple abc
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

Apply the RADIUS scheme to an ISP domain for authentication, authorization, and accounting.

```
[Device] domain bbb
[Device-isp-bbb] authentication default radius-scheme 2000
[Device-isp-bbb] authorization default radius-scheme 2000
[Device-isp-bbb] accounting default radius-scheme 2000
[Device-isp-bbb] quit
```

Specify the ISP domain for MAC authentication.

```
[Device] mac-authentication domain bbb
```

Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Verify the MAC authentication configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                  : Enable
   Authentication method               : PAP
   Username format                     : MAC address in lowercase(xx-xx-xx-xx-xx-xx)
           Username                    : mac
           Password                    : Not configured
   MAC range accounts                  : 0
          MAC address          Mask                Usernamed
   Offline detect period                      : 300 s
   Quiet period                               : 60 s
   Server timeout                             : 100 s
   Reauth period                              : 3600 s
   User aging period for critical VLAN        : 1000 s
   User aging period for guest VLAN           : 1000 s
```

```
  Temporary user aging period               : 60 s
  Authentication domain                     : bbb
  HTTP proxy port list                      : Not configured
  HTTPS proxy port list                     : Not configured
  Max number of silent MACs                 : 1024 (per slot)
Online MAC-auth wired users                 : 1

Silent MAC users:
         MAC address       VLAN ID  From port               Port index

GigabitEthernet1/0/1  is link-up
  MAC authentication                        : Enabled

Configuring portal authentication

About portal authentication

Portal authentication controls user access to networks. Portal authenticates a user by the username and password the user enters on a portal authentication page. Typically, portal authentication is deployed on the access layer and vital data entries.

In a portal-enabled network, users can actively initiate portal authentication by visiting the authentication website provided by the portal Web server. Or, they are redirected to the portal authentication page for authentication when they visit other websites.

The device supports Portal 1.0, Portal 2.0, and Portal 3.0.

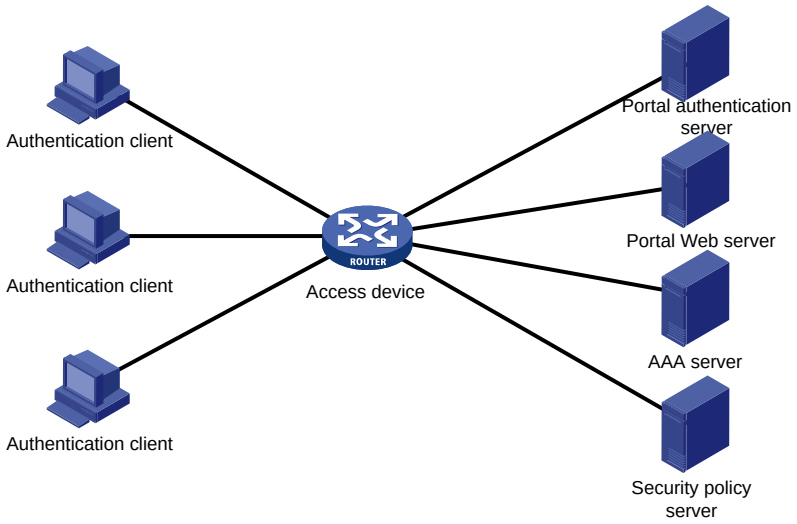
Advantages of portal authentication

Portal authentication has the following advantages:

- Allows users to perform authentication through a Web browser without installing client software.
- Provides ISPs with diversified management choices and extended functions. For example, the ISPs can place advertisements, provide community services, and publish information on the authentication page.
- Supports multiple authentication modes. For example, re-DHCP authentication implements a flexible address assignment scheme and saves public IP addresses. Cross-subnet authentication can authenticate users who reside in a different subnet than the access device.

Extended portal functions

By forcing patching and anti-virus policies, extended portal functions help hosts to defend against viruses. Portal supports the following extended functions:



- **Security check**—Detects after authentication whether or not a user host installs anti-virus software, virus definition file, unauthorized software, and operating system patches.
- **Resource access restriction**—Allows an authenticated user to access certain network resources such as the virus server and the patch server. Users can access more network resources after passing security check.

Security check must cooperate with the IMC security policy server and the iNode client.

Portal system

A typical portal system consists of these basic components: authentication client, access device, portal authentication server, portal Web server, AAA server, and security policy server.

Figure 1 Portal system

Authentication client

An authentication client is a Web browser that runs HTTP/HTTPS or a user host that runs a portal client. Security check for the user host is implemented through the interaction between the portal client and the security policy server. Only the iNode client is supported.

Access device

An access device provides access services. It has the following functions:

- Redirects all HTTP or HTTPS requests of unauthenticated users to the portal Web server.
- Interacts with the portal authentication server and the AAA server to complete authentication, authorization, and accounting.
- Allows users that pass portal authentication to access authorized network resources.

Portal server

A portal server collectively refers to a portal authentication server and portal Web server.

The portal Web server pushes the Web authentication page to authentication clients and forwards user authentication information (username and password) to the portal authentication server. The portal authentication server receives authentication requests from authentication clients and interacts with the access device to authenticate users. The portal Web server is typically integrated with the portal authentication server and it can also be an independent server.

AAA server

The AAA server interacts with the access device to implement authentication, authorization, accounting for portal users. In a portal system, a RADIUS server can perform authentication, authorization, accounting for portal users, and an LDAP server can perform authentication for portal users.

Security policy server

The security policy server interacts with the portal client and the access device for security check and authorization for users. Only hosts that run portal clients can interact with the security policy server.

Portal authentication using a remote portal server

The components of a portal system interact as follows:

1. An unauthenticated user initiates authentication by accessing an Internet website through a Web browser. When receiving the HTTP or HTTPS request, the access device redirects it to the

Web authentication page provided by the portal Web server. The user can also visit the authentication website to log in. The user must log in through the iNode client for extended portal functions.

2. The user enters the authentication information on the authentication page/dialog box and submits the information. The portal Web server forwards the information to the portal authentication server. The portal authentication server processes the information and forwards it to the access device.
3. The access device interacts with the AAA server to implement authentication, authorization, accounting for the user.
4. If security policies are not imposed on the user, the access device allows the authenticated user to access networks.

   If security policies are imposed on the user, the portal client, the access device, and the security policy server interact to check the user host. If the user passes the security check, the security policy server authorizes the user to access resources based on the check result.

Local portal service

System components

As shown in Figure 2, a local portal system consists of an authentication client, access device, and AAA server. The access device acts as both the portal Web server and the portal authentication server to provide the local portal Web service for the authentication client. The authentication client can only be a Web browser, and it cannot be a user host that runs a portal client. Therefore, extended portal functions are not supported and no security policy server is required.

Figure 2 System components

Portal page customization

The portal system pushes different authentication pages to portal users at different stages. The local portal service supports portal page customization. You can customize one or more sets of authentication pages, compress each set of authentication pages to a .zip file, and upload the compressed files to the storage medium of the device.

For more information about authentication page customization, see "Customizing authentication pages."

Portal authentication modes

Portal authentication has three modes: direct authentication, re-DHCP authentication, and cross-subnet authentication. In direct authentication and re-DHCP authentication, no Layer 3 forwarding devices exist between the authentication client and the access device. In cross-subnet authentication, Layer 3 forwarding devices can exist between the authentication client and the access device.

Direct authentication

A user manually configures a public IP address or obtains a public IP address through DHCP. Before authentication, the user can access only the portal Web server and predefined authentication-free websites. After passing authentication, the user can access other network resources. The process of direct authentication is simpler than that of re-DHCP authentication.

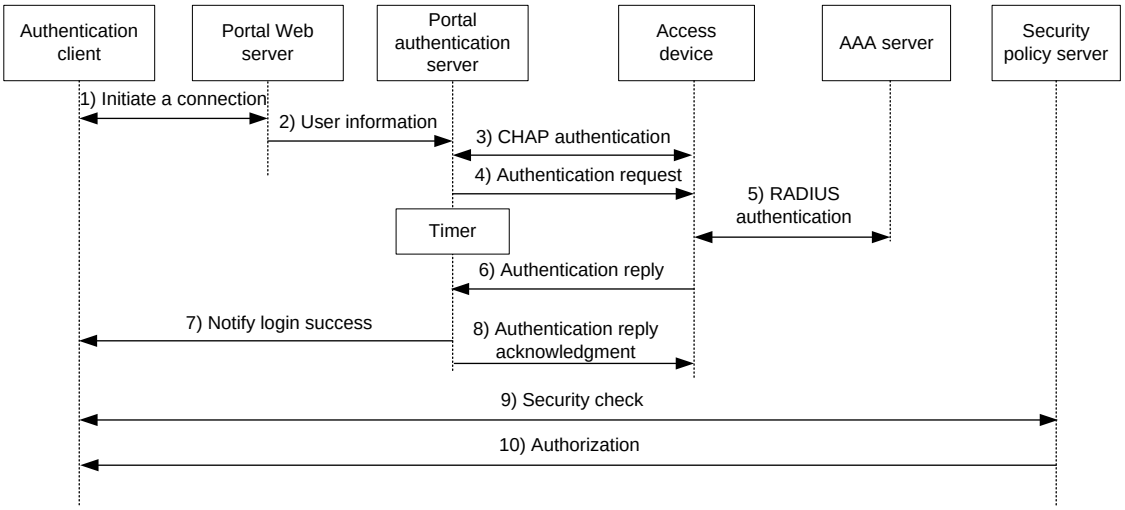
Re-DHCP authentication

Before a user passes authentication, DHCP allocates an IP address (a private IP address) to the user. The user can access only the portal Web server and predefined authentication-free websites. After the user passes authentication, DHCP reallocates an IP address (a public IP address) to the user. The user then can access other network resources. No public IP address is allocated to users who fail authentication. Re-DHCP authentication saves public IP addresses. For example, an ISP can allocate public IP addresses to broadband users only when they access networks beyond the residential community network.

Only the iNode client supports re-DHCP authentication. IPv6 portal authentication does not support the re-DHCP authentication mode.

Cross-subnet authentication

Cross-subnet authentication is similar to direct authentication, except it allows Layer 3 forwarding devices to exist between the authentication client and the access device.



In direct authentication, re-DHCP authentication, and cross-subnet authentication, a user's IP address uniquely identifies the user. After a user passes authentication, the access device generates an ACL for the user based on the user's IP address to control forwarding of the packets from the user. Because no Layer 3 forwarding device exists between authentication clients and the access device in direct authentication and re-DHCP authentication, the access device can learn the user MAC addresses. The access device can enhance its capability of controlling packet forwarding by using the learned MAC addresses.

Portal authentication process

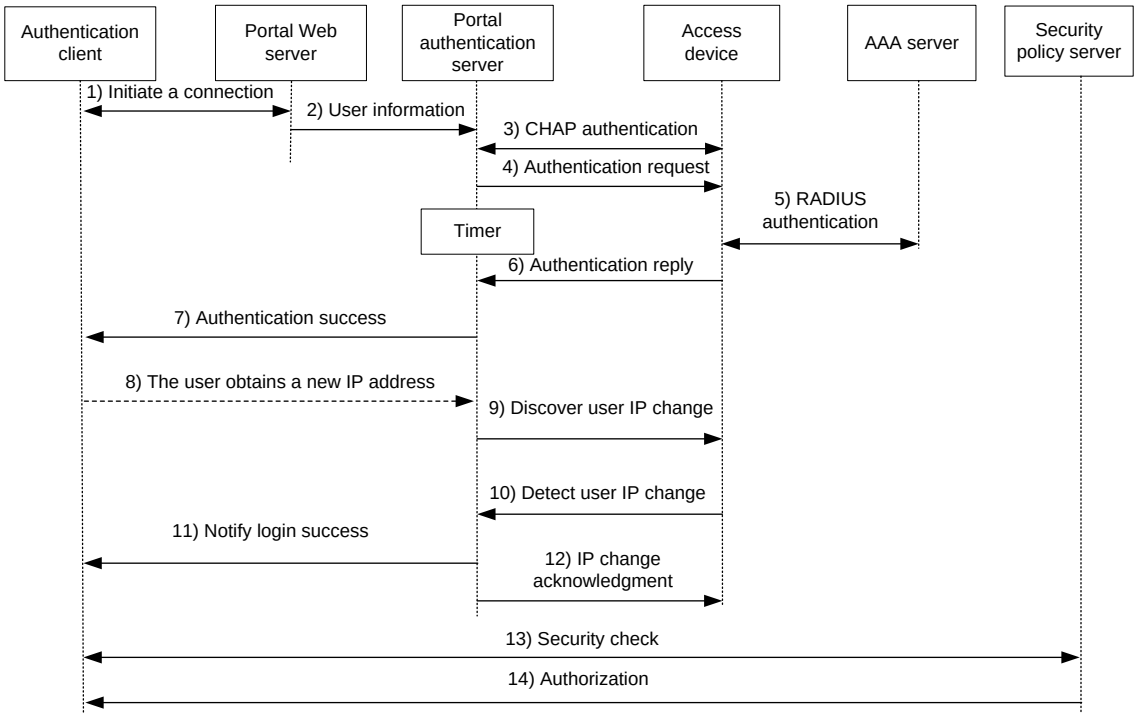
Direct authentication and cross-subnet authentication share the same authentication process. Re-DHCP authentication has a different process as it has two address allocation procedures.

Direct authentication/cross-subnet authentication process (with CHAP/PAP authentication)

Figure 3 Direct authentication/cross-subnet authentication process

The direct/cross-subnet authentication process is as follows:

1. A portal user access the Internet through HTTP or HTTPS, and the HTTP or HTTPS packet arrives at the access device.
   - If the packet matches a portal free rule, the access device allows the packet to pass.
   - If the packet does not match any portal-free rule, the access device redirects the packet to the portal Web server. The portal Web server pushes the Web authentication page to the user for him to enter his username and password.



2. The portal Web server submits the user authentication information to the portal authentication server.
3. The portal authentication server and the access device exchange CHAP messages. This step is skipped for PAP authentication. The portal authentication server decides the method (CHAP or PAP) to use.
4. The portal authentication server adds the username and password into an authentication request packet and sends it to the access device. Meanwhile, the portal authentication server starts a timer to wait for an authentication reply packet.
5. The access device and the RADIUS server exchange RADIUS packets.
6. The access device sends an authentication reply packet to the portal authentication server to notify authentication success or failure.
7. The portal authentication server sends an authentication success or failure packet to the client.
8. If the authentication is successful, the portal authentication server sends an authentication reply acknowledgment packet to the access device.

If the client is an iNode client, the authentication process includes step 9 and step 10 for extended portal functions. Otherwise the authentication process is complete.

9. The client and the security policy server exchange security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
10. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.

Re-DHCP authentication process (with CHAP/PAP authentication)

Figure 4 Re-DHCP authentication process

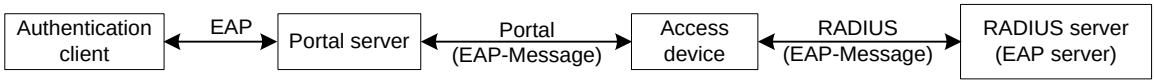
The re-DHCP authentication process is as follows:

Step 1 through step 7 are the same as those in the direct authentication/cross-subnet authentication process.

8. After receiving the authentication success packet, the client obtains a public IP address through DHCP. The client then notifies the portal authentication server that it has a public IP address.
9. The portal authentication server notifies the access device that the client has obtained a public IP address.
10. The access device detects the IP change of the client through DHCP and then notifies the portal authentication server that it has detected an IP change of the client IP.
11. After receiving the IP change notification packets sent by the client and the access device, the portal authentication server notifies the client of login success.
12. The portal authentication server sends an IP change acknowledgment packet to the access device.

Step 13 and step 14 are for extended portal functions.

13. The client and the security policy server exchanges security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
14. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.



Portal support for EAP

To use portal authentication that supports EAP, the portal authentication server and client must be the IMC portal server and the iNode portal client. Local portal authentication does not support EAP authentication.

Compared with username and password based authentication, digital certificate-based authentication ensures higher security.

The Extensible Authentication Protocol (EAP) supports several digital certificate-based authentication methods, for example, EAP-TLS. Working together with EAP, portal authentication can implement digital certificate-based user authentication.

Figure 5 Portal support for EAP working flow diagram

As shown in Figure 5, the authentication client and the portal authentication server exchange EAP authentication packets. The portal authentication server and the access device exchange portal authentication packets that carry the EAP-Message attributes. The access device and the RADIUS server exchange RADIUS packets that carry the EAP-Message attributes. The RADIUS server that supports the EAP server function processes the EAP packets encapsulated in the EAP-Message attributes, and provides the EAP authentication result.

The access device does not process but only transports EAP-Message attributes between the portal authentication server and the RADIUS server. Therefore, the access device requires no additional configuration to support EAP authentication.

Portal filtering rules

The access device uses portal filtering rules to control user traffic forwarding.

Based on the configuration and authentication status of portal users, the device generates the following categories of portal filtering rules:

- **Category 1**—The rule permits user packets that are destined for the portal Web server and packets that match the portal-free rules to pass through.

- **Category 2**—For an authenticated user not authorized with any ACL, the rule allows the user to access any destination network resources. For an authenticated user with an ACL authorized, the rule allows users to access resources permitted by the ACL. The device adds the rule when a user comes online and deletes the rule when the user goes offline.

  The device supports the following types of authorization ACLs:

  - Basic ACLs (ACL 2000 to ACL 2999).
  - Advanced ACLs (ACL 3000 to ACL 3999).
  - Layer 2 ACLs (ACL 4000 to ACL 4999).

  For an authorization ACL to take effect, make sure the ACL exists and has ACL rules excluding rules configured with the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, **`source-ip`**, or **`logging`** keyword. For more information about ACL rules, see ACL commands in *ACL and QoS Command Reference*.
- **Category 3**—The rule redirects all HTTP or HTTPS requests from unauthenticated users to the portal Web server.
- **Category 4**—For direct authentication and cross-subnet authentication, the rule forbids any user packets to pass through. For re-DHCP authentication, the device forbids user packets with private source addresses to pass.

After receiving a user packet, the device compares the packet against the filtering rules from category 1 to category 4. Once the packet matches a rule, the matching process completes.

MAC-based quick portal authentication

MAC-based quick portal authentication is applicable to scenarios where users access the network frequently. It allows users to pass authentication without entering a username and password. MAC-based quick portal authentication is also called MAC-trigger authentication or MAC-based transparent authentication.

A MAC binding server is required for MAC-trigger authentication. The MAC binding server records the MAC-to-account bindings of portal users for authentication. The account contains the portal authentication information of the user, including username and password.

Only direct authentication supports MAC-based quick portal authentication.

The authentication is implemented as follows:

1. When a user accesses the network for the first time, the access device generates a MAC-trigger entry that records the user's MAC address and access interface. The user can access the network without performing portal authentication if the user's network traffic is below the free-traffic threshold.
2. When the user's network traffic reaches the threshold, the access device sends a MAC binding query to the MAC binding server.
3. The MAC binding server checks whether the MAC address of the user is bound with a portal user account.
   - If a matching MAC-account binding exists, the MAC binding server sends the user authentication information to the access device to initiate portal authentication. The user is authenticated without entering the username and password.
     - If the user fails portal authentication, an authentication failure message is returned to the user. The MAC-trigger entry of the user on the access device is deleted when the entry ages out.
     - If the user passes portal authentication, the access device deletes the MAC-trigger entry of the user.
   - If no matching MAC-account binding exists, the MAC binding server notifies the access device to perform normal portal authentication for the user.

- If the user fails portal authentication, an authentication failure message is returned to the user. The whole process is finished.
- If the user passes portal authentication, the access device sends the user's MAC address and authentication information to the MAC binding server for MAC-account binding. Additionally, the access device deletes the MAC-trigger entry of the user.

NOTE:

For information about MAC binding server configuration, see the user manual of the server.

Restrictions and guidelines: Portal configuration

In portal authentication, the device can redirect users' HTTPS requests to the portal Web server. You can use one of the following local certificates for the HTTPS redirect service according to the security requirements and the configuration complexity:

- **Self-signed certificate**—Using this type of certificate is simple in configuration but has low security. You do not need to associate an SSL server policy with the HTTPS redirect service and the default SSL parameters are used. However, a self-signed certificate is not trusted by the browser. When the device redirects HTTPS requests to the portal Web server, a certificate security warning prompt might appear on the browser. If you accept the security risks stated in the prompt, you can ignore the prompt to browse the page.
- **CA-signed certificate**—Using this type of certificate is complex in configuration but has high security. You must obtain a CA certificate, request a local certificate from the CA, create an SSL server policy (with policy name of **https_redirect**), and associate the SSL server policy with the HTTPS redirect service.

For more information about digital certificates, see "Configuring PKI". For more information about the SSL server policy configuration, see "Configuring SSL".

Portal authentication through Web does not support security check for users. To implement security check, the client must be the iNode client.

Portal authentication supports NAT traversal whether it is initiated by a Web client or an iNode client. NAT traversal must be configured when the portal client is on a private network and the portal server is on a public network.

If the portal clients and the portal server belong to different VPNs, the Rule ARP entry feature will cause the portal clients to go offline abnormally. To avoid this issue, execute the **`undo portal refresh arp enable`** command to disable the Rule ARP entry feature for portal clients.

Do not configure rules containing source IPv4/IPv6 addresses or source MAC information for ACLs configured for the AAA server or device-authorized users. If you do so, users referencing thus ACLs might fail to come online normally. For more information about ACLs, see *Security Configuration Guide*.

Portal authentication tasks at a glance

To configure portal authentication, perform the following tasks:

1. Configuring a remote portal service

   Perform this task if the access device does not act as a portal authentication server or portal Web server.

   - Configuring a remote portal authentication server
   - Configuring a portal Web server
2. Configuring a local portal service

Perform this task if the access device acts as a portal authentication server and portal Web server.

- Configuring local portal service features
- Configuring a portal Web server

3. Enabling portal authentication and specifying a portal Web server
   - Enabling portal authentication on an interface
   - Specifying a portal Web server on an interface
4. (Optional.) Specifying a preauthentication IP address pool
5. (Optional.) Specifying a portal authentication domain
6. (Optional.) Controlling portal user access
   - Configuring a portal-free rule
   - Configuring an authentication source subnet
   - Configuring an authentication destination subnet
   - Configuring support of Web proxy for portal authentication
   - Checking the issuing of category-2 portal filtering rules
   - Setting the maximum number of portal users
   - Enabling strict-checking on portal authorization information
   - Allowing only users with DHCP-assigned IP addresses to pass portal authentication
   - Enabling portal roaming
   - Configuring the portal fail-permit feature
7. (Optional.) Configuring portal detection features
   - Configuring online detection of portal users
   - Configuring portal authentication server detection
   - Configuring portal Web server detection
   - Configuring portal user synchronization
8. (Optional.) Configuring attributes for portal packets and RADIUS packets
   - Configuring portal packet attributes

     You can configure the BAS-IP or BAS-IPv6 attribute for portal packets and specify the device ID.
   - Configuring attributes for RADIUS packets

     You can configure the NAS-Port-Id and NAS-Port-Type attributes and apply a NAS-ID profile to an interface.
9. (Optional.) Configuring MAC-based quick portal authentication
   a. Configuring a MAC binding server
   b. Specifying a MAC binding server on an interface
   c. Configuring cloud MAC-trigger authentication
10. (Optional.) Configuring online and offline related features for portal users
    - Logging out online portal users
    - Enabling portal user login/logout logging
11. (Optional.) Configuring extended portal authentication features
    - Disabling the Rule ARP or ND entry feature for portal clients
    - Configuring Web redirect
12. Obtaining user access information from ARP or ND entries

    This task is required in a remote Web authentication network.

Prerequisites for portal authentication

The portal feature provides a solution for user identity authentication and security check. To complete user identity authentication, portal must cooperate with RADIUS.

Before you configure portal, you must complete the following tasks:

- The portal authentication server, portal Web server, and RADIUS server have been installed and configured correctly.
- To use the re-DHCP portal authentication mode, make sure the DHCP relay agent is enabled on the access device, and the DHCP server is installed and configured correctly.
- The portal client, access device, and servers can reach each other.
- To use the remote RADIUS server, configure usernames and passwords on the RADIUS server, and configure the RADIUS client on the access device. For information about RADIUS client configuration, see "Configuring AAA."
- To implement extended portal functions, install and configure IMC EAD. Make sure the ACLs configured on the access device correspond to the isolation ACL and the security ACL on the security policy server. For installation and configuration about the security policy server, see *IMC EAD Security Policy Help*.

Configuring a remote portal authentication server

About this task

With portal authentication enabled, the device searches for a portal authentication server for a received portal request packet according to the source IP address and VPN information of the packet.

- If a matching portal authentication server is found, the device regards the packet valid and sends an authentication response packet to the portal authentication server. After a user logs in to the device, the user interacts with the portal authentication server as needed.
- If no matching portal authentication server is found, the device drops the packet.

Restrictions and guidelines

Do not delete a portal authentication server in use. Otherwise, users authenticated by that server cannot log out correctly.

Procedure

1. Enter system view.

   system-view

2. Create a portal authentication server and enter its view.

   portal server *server-name*

   You can create multiple portal authentication servers.

3. Specify the IP address of the portal authentication server.

   IPv4:

   ip *ipv4-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

   IPv6:

   ipv6 *ipv6-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

4. (Optional.) Set the destination UDP port number used by the device to send unsolicited portal packets to the portal authentication server.

port *port-number*

By default, the UDP port number is 50100.

This port number must be the same as the listening port number specified on the portal authentication server.

5. (Optional.) Specify the portal authentication server type.

   server-type { **cmcc** | **imc** }

   By default, the portal authentication server type is IMC.

   The specified server type must be the same as the type of the portal authentication server actually used.

6. (Optional.) Configure the device to periodically register with the portal authentication server.

   server-register [**interval** *interval-value*]

   By default, the device does not register with a portal authentication server.

7. (Optional.) Specify the SSL client policy for encrypting portal protocol packets exchanged with the portal authentication server.

   ssl client-policy *policy-name*

   By default, no SSL client policy is specified for portal protocol packet encryption. The access device interacts with the portal authentication server using plaintext.

Configuring a portal Web server

Portal Web server tasks at a glance

To configure a portal Web server, perform the following tasks:

1. Configure basic parameters for a portal Web server
2. (Optional.) Configuring a match rule for URL redirection

Configure basic parameters for a portal Web server

1. Enter system view.

   system-view

2. Create a portal Web server and enter its view.

   portal web-server *server-name*

   You can create multiple portal Web servers.

3. Specify the VPN instance to which the portal Web server belongs.

   vpn-instance *vpn-instance-name*

   By default, the portal Web server belongs to the public network.

4. Specify the URL of the portal Web server.

   url *url-string*

   By default, no URL is specified for a portal Web server.

5. Configure the parameters to be carried in the URL when the device redirects it to users.

   url-parameter *param-name* { **original-url** | **source-address** | **source-mac** [**format section** { **1** | **3** | **6** } { **lowercase** | **uppercase** }] [**encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **value** *expression* }

   By default, no redirection URL parameters are configured.

6. (Optional.) Specify the portal Web server type.

server-type { **cmcc** | **imc** | **ise** | **oauth** }

By default, the portal Web server type is IMC.

This configuration is applicable to only to the remote portal service.

The specified server type must be the same as the type of the portal Web server actually used.

Configuring a match rule for URL redirection

About this task

A URL redirection match rule matches HTTP or HTTPS requests by user-requested URL or User-Agent information, and redirects the matching requests to the specified redirection URL. Therefore, URL redirection match rules allow for more flexible URL redirection than the **url** command. The **url** command is only used to redirect HTTP or HTTPS requests from unauthenticated users to the portal Web server for authentication.

Restrictions and guidelines

For a user to successfully access a redirection URL, configure a portal-free rule to allow HTTP or HTTPS requests destined for the redirection URL to pass. For information about configuring portal-free rules, see the **portal free-rule** command.

If both the **url** and **if-match** commands are executed, the **if-match** command takes priority to perform URL redirection.

Procedure

1. Enter system view.

   system-view

2. Enter portal Web server view.

   portal web-server *server-name*

3. Configure a match rule for URL redirection.

   if-match { **original-url** *url-string* **redirect-url** *url-string* [**url-param-encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **user-agent** *string* **redirect-url** *url-string* }

Configuring local portal service features

About the local portal service

After a local portal service is configured, the device acts as the portal Web server and portal authentication server to perform portal authentication on users. The portal authentication page file is saved in the root directory of the device.

Restrictions and guidelines for configuring local portal service features

For an interface to use the local portal service, the URL of the portal Web server specified for the interface must meet the following requirements:

- The IP address in the URL must be the IP address of a Layer 3 interface (except 127.0.0.1) on the device, and the IP address must be reachable to portal clients.
- The URL must be ended with **/portal/**. For example: **https://1.1.1.1/portal/**.

The device provides a default authentication page file. To use customized authentication pages, you must edit the authentication pages, compress them to a file, and then upload the file to the device. On the device, specify the file as the default authentication page file.

Customizing authentication pages

About this task

Authentication pages are HTML files. Local portal authentication requires the following authentication pages:

- Logon page
- Logon success page
- Logon failure page
- Online page
- System busy page
- Logoff success page

You must customize the authentication pages, including the page elements that the authentication pages will use, for example, **back.jpg** for authentication page **Logon.htm**.

Follow the authentication page customization rules when you edit the authentication page files.

File name rules

The names of the main authentication page files are fixed (see Table 1). You can define the names of the files other than the main authentication page files. File names and directory names are case insensitive.

Table 1 Main authentication page file names

Main authentication page	File name
Logon page	logon.htm
Logon success page	logonSuccess.htm
Logon failure page	logonFail.htm
Online page Pushed after the user gets online for online notification	online.htm
System busy page Pushed when the system is busy or the user is in the logon process	busy.htm
Logoff success page	logoffSuccess.htm

Page request rules

The local portal Web server supports only Get and Post requests.

- **Get requests**—Used to get the static files in the authentication pages and allow no recursion. For example, if file **Logon.htm** includes contents that perform Get action on file **ca.htm**, file **ca.htm** cannot include any reference to file **Logon.htm**.
- **Post requests**—Used when users submit username and password pairs, log in, and log out.

Post request attribute rules

1. Observe the following requirements when editing a form of an authentication page:
   - An authentication page can have multiple forms, but there must be one and only one form whose action is **logon.cgi**. Otherwise, user information cannot be sent to the access device.

- The username attribute is fixed as **PtUser**. The password attribute is fixed as **PtPwd**.
- The value of the **PtButton** attribute is either **Logon** or **Logoff**, which indicates the action that the user requests.
- A logon Post request must contain **PtUser**, **PtPwd**, and **PtButton** attributes.
- A logoff Post request must contain the **PtButton** attribute.

2. Authentication pages **logon.htm** and **logonFail.htm** must contain the logon Post request.

The following example shows part of the script in page **logon.htm**.

```
<form action=logon.cgi method = post >
<p>User name:<input type="text" name = "PtUser" style="width:160px;height:22px"
maxlength=64>
<p>Password :<input type="password" name = "PtPwd" style="width:160px;height:22px"
maxlength=32>
<p><input type=SUBMIT value="Logon" name = "PtButton" style="width:60px;"
onclick="form.action=form.action+location.search;">
</form>
```

3. Authentication pages **logonSuccess.htm** and **online.htm** must contain the logoff Post request.

The following example shows part of the script in page **online.htm**.

```
<form action=logon.cgi method = post >
<p><input type=SUBMIT value="Logoff" name="PtButton" style="width:60px;">
</form>
```

Page file compression and saving rules

You must compress the authentication pages and their page elements into a standard zip file.

- The name of a zip file can contain only letters, numbers, and underscores.
- The authentication pages must be placed in the root directory of the zip file.
- Zip files can be transferred to the device through FTP or TFTP and must be saved in the root directory of the device.

  Examples of zip files on the device:

```
<Sysname> dir
Directory of flash:
   1     -rw-      1405  Feb 28 2008 15:53:20   ssid1.zip
   0     -rw-      1405  Feb 28 2008 15:53:31   ssid2.zip
   2     -rw-      1405  Feb 28 2008 15:53:39   ssid3.zip
   3     -rw-      1405  Feb 28 2008 15:53:44   ssid4.zip
2540 KB total (1319 KB free)
```

Redirecting authenticated users to a specific webpage

To make the device automatically redirect authenticated users to a specific webpage, do the following in logon.htm and logonSuccess.htm:

1. In logon.htm, set the target attribute of Form to **_blank**.

See the contents in gray:

```
<form method=post action=logon.cgi target="_blank">
```

2. Add the function for page loading pt_init() to LogonSuccess.htm.

See the contents in gray:

```
<html>
<head>
<title>LogonSuccess</title>
```

```
    <script type="text/javascript" language="javascript"
src="pt_private.js"></script>
    </head>
    <body onload="pt_init();" onbeforeunload="return pt_unload();">
    ... ...
    </body>
</html>
```

Configuring a local portal Web service

Prerequisites

Before you configure an HTTPS-based local portal Web service, you must complete the following tasks:

- Configure a PKI policy, obtain the CA certificate, and request a local certificate. For more information, see "Configuring PKI."
- Configure an SSL server policy, and specify the PKI domain configured in the PKI policy.

  During SSL connection establishment, the user browser might display a message that it cannot verify server identity by certificate. For users to perform portal authentication without checking such a message, configure an SSL server policy to request a client-trusted certificate on the device. The name of the policy must be **https_redirect**. For more information about SSL server policy configuration, see "Configuring SSL."

Procedure

1. Enter system view.

   system-view
2. Enable HTTP- or HTTPS-based local portal Web service and enter its view.

   portal local-web-server { **http** | **https ssl-server-policy** *policy-name* [**tcp-port** *port-number*] }
3. Specify the default authentication page file for the local portal Web service.

   default-logon-page *filename*

   By default, the default authentication page file for a local portal Web service is file **defaultfile.zip**.
4. (Optional.) Configure the HTTP or HTTPS listening TCP port for the local portal Web service.

   tcp-port *port-number*

   By default, the HTTP service listening port number is 80 and the HTTPS service listening port number is the TCP port number set by the **portal local-web-server** command.

Enabling portal authentication on an interface

Restrictions and guidelines

When you enable portal authentication on an interface, follow these restrictions and guidelines:

- Cross-subnet authentication mode (**layer3**) does not require Layer 3 forwarding devices between the access device and the portal authentication clients. However, if a Layer 3 forwarding device exists between the authentication client and the access device, you must use the cross-subnet portal authentication mode.
- You can enable both IPv4 portal authentication and IPv6 portal authentication on an interface.

When you configure re-DHCP portal authentication on an interface, follow these restrictions and guidelines:

- Make sure the interface has a valid IP address before you enable re-DHCP portal authentication on the interface.
- With re-DHCP portal authentication, configure authorized ARP on the interface as a best practice to make sure only valid users can access the network. With authorized ARP configured on the interface, the interface learns ARP entries only from the users who have obtained a public address from DHCP.
- For successful re-DHCP portal authentication, make sure the BAS-IP or BAS-IPv6 attribute value is the same as the device IP address specified on the portal authentication server. To configure the attribute, use the **portal** { **bas-ip** | **bas-ipv6** } command.
- An IPv6 portal server does not support re-DHCP portal authentication.

Portal authentication supports both HTTP redirect and HTTPS redirect. The default HTTPS redirect listening port number on the device is 6654. To change the HTTPS redirect listening port number, see HTTP redirect configuration in *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Enable portal authentication.

   IPv4:

   portal enable method { **direct** | **layer3** | **redhcp** }

   IPv6:

   portal ipv6 enable method { **direct** | **layer3** }

   By default, portal authentication on an interface is disabled.

Specifying a portal Web server on an interface

About this task

With a portal Web server specified on an interface, the device redirects the HTTP requests of portal users on the interface to the portal Web server.

You can specify both an IPv4 portal Web server and an IPv6 portal Web server on an interface.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify a portal Web server on the interface.

   portal [**ipv6**] **apply web-server** *server-name* [**fail-permit** | **secondary**]

   By default, no portal Web servers are specified on an interface.

Specifying a preauthentication IP address pool

About this task

After a user connects to a portal-enabled interface, the user uses an IP address for portal authentication according to the following rules:

- If the interface is configured with a preauthentication IP address pool, the user uses the following IP address:
  - If the client is configured to obtain an IP address automatically through DHCP, the user obtains an address from the specified IP address pool.
  - If the client is configured with a static IP address, the user uses the static IP address.
- If the interface has an IP address but no preauthentication IP pool specified, the user uses the static IP address or the IP address obtained from a DHCP server.
- If the interface has no IP address or preauthentication IP pool specified, the user cannot perform portal authentication.

After the user passes portal authentication, the AAA server authorizes an IP address pool for re-assigning an IP address to the user. If no authorized IP address pool is deployed, the user continues using the previous IP address.

Restrictions and guidelines

This configuration takes effect only when the direct IPv4 portal authentication is enabled on the interface.

Make sure the specified IP address pool exists and is complete. Otherwise, the user cannot obtain the IP address and cannot perform portal authentication.

If the portal user does not perform authentication or fails to pass authentication, the assigned IP address is still retained.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify a preauthentication IP address pool on the interface.

   portal [**ipv6**] **pre-auth ip-pool** *pool-name*

   By default, no preauthentication IP address pool is specified on an interface.

Specifying a portal authentication domain

About portal authentication domains

An authentication domain defines a set of authentication, authorization, and accounting policies. Each portal user belongs to an authentication domain and is authenticated, authorized, and accounted in the domain.

With an authentication domain specified on an interface, the device uses the authentication domain for AAA of portal users. This allows for flexible portal access control.

Restrictions and guidelines for specifying a portal authentication domain

The device selects the authentication domain for a portal user in this order:

1. ISP domain specified for the interface.
2. ISP domain carried in the username.
3. System default ISP domain.

If the chosen domain does not exist on the device, the device searches for the ISP domain configured to accommodate users assigned to nonexistent domains. If no such ISP domain is configured, user authentication fails. For information about ISP domains, see "Configuring AAA."

For the authorization ACL in the authentication domain, the following rules apply:

- If the user traffic matches a rule in the ACL, the device processes the traffic based on the permit or deny statement of the rule.
- If the user traffic does not match any rule in the ACL, the device permits the traffic. To deny such traffic, configure the last rule in the ACL to deny all packets by using the **rule deny ip** command.
- If the ACL contains rules that specify a source address, users might not be able to get online. Do not specify a source IPv4, IPv6, or MAC address when you configure a rule in the ACL.

Specifying a portal authentication domain on an interface

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify an portal authentication domain on the interface.

   portal [**ipv6**] **domain** *domain-name*

   By default, no portal authentication domain is specified on an interface.

   You can specify both an IPv4 portal authentication domain and an IPv6 portal authentication domain on an interface.

Controlling portal user access

Configuring a portal-free rule

About this task

A portal-free rule allows specified users to access specified external websites without portal authentication.

The matching items for a portal-free rule include the host name, source/destination IP address, TCP/UDP port number, source MAC address, access interface, and VLAN. Packets matching a portal-free rule will not trigger portal authentication, so users sending the packets can directly access the specified external websites.

Restrictions and guidelines for configuring a portal-free rule

If you specify both a VLAN and an interface, the interface must belong to the VLAN. If the interface does not belong to the VLAN, the portal-free rule does not take effect.

You cannot configure two or more portal-free rules with the same filtering criteria. Otherwise, the system prompts that the rule already exists.

Regardless of whether portal authentication is enabled or not, you can only add or remove a portal-free rule. You cannot modify it.

Configuring an IP-based portal-free rule

1. Enter system view.

   system-view

2. Configure an IP-based portal-free rule.

   IPv4:

   portal free-rule *rule-number* { **destination ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

   IPv6:

   portal free-rule *rule-number* { **destination ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

Configuring a source-based portal-free rule

1. Enter system view.

   system-view

2. Configure a source-based portal-free rule.

   portal free-rule *rule-number* **source** { **interface** *interface-type interface-number* | **mac** *mac-address* [*mac-address-mask*] | **vlan** *vlan-id* } *

   The **vlan** *vlan-id* option takes effect only on portal users that access the network through VLAN interfaces.

Configuring a destination-based portal-free rule

1. Enter system view.

   system-view

2. Configure a destination-based portal-free rule.

   portal free-rule *rule-number* **destination** *host-name*

   Before you configure destination-based portal-free rules, make sure a DNS server is deployed on the network.

Configuring an authentication source subnet

About this task

By configuring authentication source subnets, you specify that only HTTP or HTTPS packets from users on the authentication source subnets can trigger portal authentication. HTTP or HTTPS packets from users not in authentication source subnets will be discarded if the packets do not match any portal-free rules.

Restrictions and guidelines

Authentication source subnets are used only for cross-subnet authentication.

In direct or re-DHCP portal authentication mode, a portal user and its access interface (portal-enabled) are on the same subnet. It is not necessary to specify the subnet as the authentication source subnet.

- In direct mode, the access device regards the authentication source subnet as any source IP address.
- In re-DHCP mode, the access device regards the authentication source subnet on an interface as the subnet to which the private IP address of the interface belongs.

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication source subnets. If the source subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure a portal authentication source subnet.

   IPv4:

   portal layer3 source *ipv4-network-address* { *mask-length* | *mask* }

   IPv6:

   portal ipv6 layer3 source *ipv6-network-address prefix-length*.

   By default, no portal authentication source subnets are configured, and users from any subnets can trigger portal authentication.

Configuring an authentication destination subnet

About this task

After authentication destination subnets are configured, the device performs portal authentication on portal users only when they access the specified subnets (excluding the destination IP addresses and subnets specified in portal-free rules). Users can access other subnets without portal authentication.

Restrictions and guidelines

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication destination subnets. If the destination subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure a portal authentication destination subnet.

   IPv4:

   portal free-all except destination *ipv4-network-address* { *mask-length* | *mask* }

   IPv6:

portal ipv6 free-all except destination *ipv6-network-address prefix-length*

By default, no authentication destination subnets are configured, and users accessing any subnets must pass portal authentication.

Configuring support of Web proxy for portal authentication

About this task

To allow HTTP requests proxied by a Web proxy server to trigger portal authentication, specify the port number of the Web proxy server on the device. If a Web proxy server port is not specified on the device, HTTP requests proxied by the Web proxy server are dropped, and portal authentication cannot be triggered.

Restrictions and guidelines

If a user's browser uses the Web Proxy Auto-Discovery (WPAD) protocol to discover Web proxy servers, you must perform the following tasks on the device:

- Specify port numbers of the Web proxy servers.
- Configure portal-free rules to allow user packets destined for the WPAD server to pass without authentication.

If portal users enable Web proxy in their browsers, the users must add the IP address of the portal authentication server as a proxy exception in their browsers. Thus, HTTP packets that the users send to the portal authentication server will not be sent to Web proxy servers.

You cannot specify Web proxy server port 443 on the device.

You can execute this command multiple times to specify multiple port numbers of Web proxy servers.

Procedure

1. Enter system view.

   system-view

2. Specify the port number of a Web proxy server.

   portal web-proxy port *port-number*

   By default, no port numbers of Web proxy servers are specified. Proxied HTTP requests are dropped.

Checking the issuing of category-2 portal filtering rules

About this task

Category-2 portal filtering rules permit authenticated users to access authorized network resources. By default, the device allows an authenticated user to come online as long as a member device has issued a category-2 portal filtering rule for the user. Users coming online from global interfaces might fail to access network resources because some member ports might not have category-2 rules for the users. To resolve this issue, enable the device to check the issuing of category-2 portal filtering rules. Then, the device allows users to come online only when all member devices have issued category-2 portal filtering rules for the users.

As a best practice, perform this task when portal authentication is enabled on a global interface.

Procedure

1. Enter system view.

   system-view

2. Enable the device to check the issuing of category-2 portal filtering rules.

portal user-rule assign-check enable

By default, the device does not check the issuing of category-2 portal filtering rules.

Setting the maximum number of portal users

About this task

Perform this task to control the total number of portal users in the system, and the maximum number of IPv4 or IPv6 portal users on an interface.

Restrictions and guidelines for setting the maximum number of portal users

Make sure the maximum combined number of IPv4 and IPv6 portal users specified on all interfaces does not exceed the global maximum number. Otherwise, the exceeding number of portal users will not be able to log in to the device.

Make sure the sum of the maximum number of portal users for IPv4 and IPv6 on an interface does not exceed the maximum number of all portal users set on the interface. Otherwise, the exceeding number of portal users cannot come online from the interface.

You can set the maximum number of portal users in interface view or system view. The maximum number of portal users allowed on an interface is the smallest value among the following items:

- Maximum number of IPv4 or IPv6 portal users allowed on the interface.
- Maximum number of all portal users allowed on the interface.
- Global maximum number of portal users.

Setting the global maximum number of portal users

1. Enter system view.

   system-view

2. Set the global maximum number of portal users.

   portal max-user *max-number*

   By default, no limit is set on the global number of portal users.

   If you set the global maximum number smaller than the number of current online portal users on the device, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in.

Setting the maximum number of portal users on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Set the maximum number of portal users.

   portal { **ipv4-max-user** | **ipv6-max-user** | **max-user** } *max-number*

   By default, no limit is set on the number of portal users on an interface.

   If you set the maximum number smaller than the current number of portal users on an interface, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in from the interface.

Enabling strict-checking on portal authorization information

About this task

The strict checking feature allows a portal user to stay online only when the authorization information for the user is successfully deployed.

Enabling strict checking on portal authentication information on an interface

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Enable strict checking on portal authorization information.
   portal authorization { **acl** | **user-profile** } **strict-checking**

CAUTION:

- The device logs out a portal user if the authorized ACL or user profile does not exist on the device or fails to be deployed.
- You can enable strict checking on the authorized ACL, authorized user profile, or both. If you enable both ACL checking and user profile checking, the user will be logged out if either checking fails.

By default, strict checking on portal authorization information is disabled on an interface. Portal users stay online even when the authorized ACL or user profile does not exist or fails to be deployed.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication

About this task

This feature allows only users with DHCP-assigned IP addresses to pass portal authentication. Use this feature to ensure that only users with valid IP addresses can access the network.

Restrictions and guidelines

This feature takes effect only when the device acts as both the access device and the DHCP server.

Configuration of this feature does not affect the online portal users.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication on an interface

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Allow only users with DHCP-assigned IP addresses to pass portal authentication.
   portal [**ipv6**] **user-dhcp-only**

CAUTION:

- Users with static IP addresses cannot pass portal authentication to come online.
- If this feature is configured, to ensure that IPv6 users can pass portal authentication, disable the temporary IPv6 address feature on terminal devices. Otherwise, IPv6 users will use temporary IPv6 addresses to access the IPv6 network and will fail portal authentication.

By default, both users with IP addresses obtained through DHCP and users with static IP addresses can pass authentication to come online.

Enabling portal roaming

About this task

If portal roaming is enabled on a VLAN interface, an online portal user can access resources from any Layer 2 port in the VLAN without re-authentication.

If portal roaming is disabled, to access external network resources from a Layer 2 port different from the current access port in the VLAN, the user must do the following:

1. Logs out from the current port.
2. Re-authenticates on the new Layer 2 port.

Restrictions and guidelines

Portal roaming takes effect only on portal users logging in from VLAN interfaces. It does not take effect on portal users logging in from common Layer 3 interface.

You cannot enable portal roaming when online portal users or preauthentication portal users exist on the device.

For portal roaming to take effect, you must disable the Rule ARP or ND entry feature by using the **undo portal refresh** { **arp** | **nd** } **enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable portal roaming.

   portal roaming enable

   By default, portal roaming is disabled.

Configuring the portal fail-permit feature

About this task

Perform this task to configure the portal fail-permit feature on an interface. When the access device detects that the portal authentication server or portal Web server is unreachable, it allows users on the interface to have network access without portal authentication.

If you enable fail-permit for both a portal authentication server and a portal Web server on an interface, the interface does the following:

- Disables portal authentication when either server is unreachable.
- Resumes portal authentication when both servers are reachable.

After portal authentication resumes, unauthenticated users must pass portal authentication to access the network. Users who have passed portal authentication before the fail-permit event can continue accessing the network.

Restrictions and guidelines

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

interface *interface-type interface-number*

3. Enable portal fail-permit for a portal authentication server.
   portal [**ipv6**] **fail-permit server** *server-name*
   By default, portal fail-permit is disabled for a portal authentication server.
4. Enable portal fail-permit for portal Web servers.
   portal [**ipv6**] **fail-permit web-server**
   By default, portal fail-permit is disabled for portal Web servers.

Configuring portal detection features

Configuring online detection of portal users

About this task

Use the online detection feature to quickly detect abnormal logouts of portal users. Configure ARP or ICMP detection for IPv4 portal users. Configure ND or ICMPv6 detection for IPv6 portal users.

If the device receives no packets from a portal user within the idle time, the device detects the user's online status as follows:

- **ICMP or ICMPv6 detection**—Sends ICMP or ICMPv6 requests to the user at configurable intervals to detect the user status.
  - If the device receives a reply within the maximum number of detection attempts, it considers that the user is online and stops sending detection packets. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the device receives no reply after the maximum number of detection attempts, the device logs out the user.
- **ARP or ND detection**—Sends ARP or ND requests to the user and detects the ARP or ND entry status of the user at configurable intervals.
  - If the ARP or ND entry of the user is refreshed within the maximum number of detection attempts, the device considers that the user is online and stops detection. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the ARP or ND entry of the user is not refreshed after the maximum number of detection attempts, the device logs out the user.

Restrictions and guidelines

ARP detection and ND detection apply only to direct and re-DHCP portal authentication. ICMP detection applies to all portal authentication modes.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure online detection of portal users.
   IPv4:
   portal user-detect type { **arp** | **icmp** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]
   IPv6:
   portal ipv6 user-detect type { **icmpv6** | **nd** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]

By default, online detection is disabled for portal users on an interface.

Configuring portal authentication server detection

About this task

During portal authentication, if the communication between the access device and portal authentication server is broken, new portal users are not able to log in. Online portal users are not able to log out normally.

To address this problem, the access device needs to be able to detect the reachability changes of the portal server quickly and take corresponding actions to deal with the changes.

The portal authentication server detection feature enables the device to periodically detect portal packets sent by a portal authentication server to determine the reachability of the server. If the device receives a portal packet within a detection timeout (**timeout** *timeout*) and the portal packet is valid, the device considers the portal authentication server to be reachable. Otherwise, the device considers the portal authentication server to be unreachable.

Portal packets include user login packets, user logout packets, and heartbeat packets. Heartbeat packets are periodically sent by a server. By detecting heartbeat packets, the device can detect the server's actual status more quickly than by detecting other portal packets.

Restrictions and guidelines

The portal authentication server detection feature takes effect only when the device has a portal-enabled interface.

Only the IMC portal authentication server supports sending heartbeat packets. To test server reachability by detecting heartbeat packets, you must enable the server heartbeat feature on the IMC portal authentication server.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a trap message to the NMS. The trap message contains the name and current state of the portal authentication server.
- Sending a log message, which contains the name, the current state, and the original state of the portal authentication server.
- Enabling portal fail-permit. When the portal authentication server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."
- Make sure the detection timeout configured on the device is greater than the server heartbeat interval configured on the portal authentication server.

Procedure

1. Enter system view.

   system-view

2. Enter portal authentication server view.

   portal server *server-name*

3. Configure portal authentication server detection.

   server-detect [**timeout** *timeout*] { **log** | **trap** } *

   By default, portal authentication server detection is disabled.

Configuring portal Web server detection

About this task

A portal authentication process cannot complete if the communication between the access device and the portal Web server is broken. To address this problem, you can enable portal Web server detection on the access device.

With the portal Web server detection feature, the access device simulates a Web access process to initiate a TCP connection to the portal Web server. If the TCP connection can be established successfully, the access device considers the detection successful, and the portal Web server is reachable. Otherwise, it considers the detection to have failed.

You can configure the following detection parameters:

- **Detection interval**—Interval at which the device detects the server reachability.
- **Maximum number of consecutive failures**—If the number of consecutive detection failures reaches this value, the access device considers that the portal Web server is unreachable.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a trap message to the NMS. The trap message contains the name and current state of the portal Web server.
- Sending a log message, which contains the name, the current state, and the original state of the portal Web server.
- Enabling portal fail-permit. When the portal Web server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."

Restrictions and guidelines

The portal Web server detection feature takes effect only when the URL of the portal Web server is specified and the device has a portal-enabled interface.

Procedure

1. Enter system view.

   system-view
2. Enter portal Web server view.

   portal web-server *server-name*
3. Configure portal Web server detection.

   server-detect [**interval** *interval*] [**retry** *retries*] { **log** | **trap** } *

   By default, portal Web server detection is disabled.

Configuring portal user synchronization

About this task

Once the access device loses communication with a portal authentication server, the portal user information on the access device and that on the portal authentication server might be inconsistent after the communication resumes. To address this problem, the device provides the portal user synchronization feature. This feature is implemented by sending and detecting portal synchronization packets, as follows:

1. The portal authentication server sends the online user information to the access device in a synchronization packet at the user heartbeat interval.

   The user heartbeat interval is set on the portal authentication server.

2. Upon receiving the synchronization packet, the access device compares the users carried in the packet with its own user list and performs the following operations:
   - If a user contained in the packet does not exist on the access device, the access device informs the portal authentication server to delete the user. The access device starts the synchronization detection timer (**timeout** *timeout*) immediately when a user logs in.
   - If the user does not appear in any synchronization packet within a synchronization detection interval, the access device considers the user does not exist on the portal authentication server and logs the user out.

Restrictions and guidelines

Portal user synchronization requires a portal authentication server to support the portal user heartbeat function. Only the IMC portal authentication server supports the portal user heartbeat function. To implement the portal user synchronization feature, you also need to configure the user heartbeat function on the portal authentication server. Make sure the user heartbeat interval configured on the portal authentication server is not greater than the synchronization detection timeout configured on the access device.

Deleting a portal authentication server on the access device also deletes the user synchronization configuration for the portal authentication server.

Procedure

1. Enter system view.
   system-view
2. Enter portal authentication server view.
   portal server *server-name*
3. Configure portal user synchronization.
   user-sync timeout *timeout*
   By default, portal user synchronization is disabled.

Configuring portal packet attributes

Configuring the BAS-IP or BAS-IPv6 attribute

About this task

If the device runs Portal 2.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP attribute. If the device runs Portal 3.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP or BAS-IPv6 attribute.

After this attribute is configured, the source IP address for unsolicited notification portal packets the device sends to the portal authentication server is the configured BAS-IP or BAS-IPv6 address. If the attribute is not configured, the source IP address of the portal packets is the IP address of the packet output interface.

Restrictions and guidelines

During a re-DHCP portal authentication or mandatory user logout process, the device sends portal notification packets to the portal authentication server. For the authentication or logout process to complete, make sure the BAS-IP/BAS-IPv6 attribute is the same as the device IP address specified on the portal authentication server.

You must configure the BAS-IP or BAS-IPv6 attribute on a portal authentication-enabled interface if the following conditions are met:

- The portal authentication server is an IMC server.

- The portal device IP address specified on the portal authentication server is not the IP address of the portal packet output interface.

Configuring the BAS-IP or BAS-IPv6 attribute on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure the BAS-IP or BAS-IPv6 attribute.

   IPv4:

   portal bas-ip *ipv4-address*

   By default, the BAS-IP attribute of an IPv4 portal reply packet is the source IPv4 address of the packet. The BAS-IP attribute of an IPv4 portal notification packet is the IPv4 address of the packet's output interface.

   IPv6:

   portal bas-ipv6 *ipv6-address*

   By default, the BAS-IPv6 attribute of an IPv6 portal reply packet is the source IPv6 address of the packet. The BAS-IPv6 attribute of an IPv6 portal notification packet is the IPv6 address of the packet's output interface.

Specifying the device ID

About this task

The portal authentication server uses device IDs to identify the devices that send protocol packets to the portal server.

Restrictions and guidelines

Make sure the configured device ID is different than any other access devices communicating with the same portal authentication server.

Procedure

1. Enter system view.

   system-view

2. Specify the device ID.

   portal device-id *device-id*

   By default, a device is not configured with a device ID.

Configuring attributes for RADIUS packets

Specifying a format for the NAS-Port-Id attribute

About this task

RADIUS servers from different vendors might require different formats of the NAS-Port-Id attribute in the RADIUS packets. You can specify the NAS-Port-Id attribute format as required.

The device supports predefined formats (format 1, 2, 3, and 4). For more information about the formats, see portal commands in *Security Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Specify the format for the NAS-Port-Id attribute.
   portal nas-port-id format { **1** | **2** | **3** | **4** }
   By default, the format for the NAS-Port-Id attribute is format 2.

Configuring the NAS-Port-Type attribute

About this task

The NAS-Port-Type attribute in a RADIUS request represents the type of a user's access interface.

The access device might not be able to correctly obtain the type of users' access interfaces when multiple network devices exist between the access device and the portal client. For the access device to send the correct access interface type to the RADIUS server, perform this task to configure the NAS-Port-Type attribute.

Restrictions and guidelines

This configuration takes effect only on portal users that newly come online.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure the NAS-Port-Type attribute carried in outgoing RADIUS requests on the interface.
   portal nas-port-type { **802.11** | **adsl-cap** | **adsl-dmt** | **async** | **cable** | **ethernet** | **g.3-fax** | **hdlc** | **idsl** | **isdn-async-v110** | **isdn-async-v120** | **isdn-sync** | **piafs** | **sdsl** | **sync** | **virtual** | **wireless-other** | **x.25** | **x.75** | **xdsl** }
   By default, the NAS-Port-Type carried in outgoing RADIUS requests is Ethernet (attribute value 15).

Applying a NAS-ID profile to an interface

About this task

By default, the device sends its device name in the NAS-Identifier attribute of all RADIUS requests.

A NAS-ID profile enables you to send different NAS-Identifier attribute strings in RADIUS requests from different VLANs. The strings can be organization names, service names, or any user categorization criteria, depending on the administrative requirements.

For example, map the NAS-ID **companyA** to all VLANs of company A. The device will send **companyA** in the NAS-Identifier attribute for the RADIUS server to identify requests from any Company A users.

Restrictions and guidelines

You can apply a NAS-ID profile to a portal-enabled interface. If no NAS-ID profile is specified on the interface or no matching NAS-ID is found in the specified profile, the device uses the device name as the interface NAS-ID.

Procedure

1. Enter system view.
   system-view
2. Create a NAS-ID profile and enter NAS-ID profile view.
   aaa nas-id profile *profile-name*
   For more information about this command, see *Security Command Reference*.
3. Configure a NAS ID and VLAN binding in the profile.
   nas-id *nas-identifier* **bind vlan** *vlan-id*
   For more information about this command, see *Security Command Reference*. Portal access matches only the inner VLAN ID of QinQ packets. For more information about QinQ, see *Layer 2—LAN Switching Configuration Guide*.
4. Specify the NAS-ID profile on the interface.
   a. Return to system view.
      quit
   b. Enter Layer 3 interface view.
      interface *interface-type interface-number*
   c. Specify the NAS-ID profile on the interface.
      portal nas-id-profile *profile-name*
      By default, no NAS-ID profile is specified for an interface.

Configuring MAC-based quick portal authentication

Restrictions and guidelines for configuring MAC-based quick portal authentication

Only direct portal authentication supports MAC-based quick portal authentication.

For MAC-based quick portal authentication to take effect on an interface configured with a portal preauthentication policy, set the free-traffic threshold to 0 bytes.

Configuring a MAC binding server

About this task

You can configure multiple MAC binding servers on the device.

Perform this task to configure MAC binding server parameters, such as the server's IP address, VPN instance, port number, and the pre-shared key for communication between the access device and the server.

Procedure

1. Enter system view.
   system-view
2. Create a MAC binding server and enter its view.
   portal mac-trigger-server *server-name*
   By default, no MAC binder servers exist.

3. Configure a MAC binding server.
   - Specify the IP address of the MAC binding server.

     IPv4:

     ip *ipv4-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

     IPv6:

     ipv6 *ipv6-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

     By default, no MAC binding server address is specified.
   - (Optional.) Set the UDP port number on which the MAC binding server listens for MAC binding query packets.

     port *port-number*

     By default, the MAC binding server listens for MAC binding query packets on UDP port 50100.
   - (Optional.) Set the maximum number of attempts and the interval for sending MAC binding queries to the MAC binding server.

     binding-retry { *retries* | **interval** *interval* } *

     By default, the maximum number of query attempts is 3 and the query interval is 1 second.
   - (Optional.) Specify the type of the MAC binding server.

     server-type { **cmcc** | **imc** }

     By default, the type of a MAC binding server is IMC.
4. (Optional.) Set the free-traffic threshold.

   free-traffic threshold *value*

   By default, the free-traffic threshold is 0 bytes.
5. (Optional.) Set the NAS-Port-Type value carried in RADIUS requests sent to the RADIUS server.

   nas-port-type *value*

   By default, the NAS-Port-Type value carried in RADIUS requests is 0.
6. (Optional.) Specify the version of the portal protocol.

   version *version-number*

   By default, the version of the portal protocol is 1.
7. (Optional.) Set the timeout the device waits for portal authentication to complete after receiving the MAC binding query response.

   authentication-timeout *minutes*

   By default, the portal authentication timeout time is 3 minutes.
8. (Optional.) Set the aging time for MAC-trigger entries.

   aging-time *seconds*

   By default, the aging time for MAC-trigger entries is 300 seconds.
9. (Optional.) Specify the SSL client policy for encrypting portal protocol packets exchanged with the portal authentication server.

   ssl client-policy *policy-name*

   By default, no SSL client policy is specified for portal protocol packet encryption. The access device interacts with the portal authentication server using plaintext.

Specifying a MAC binding server on an interface

About this task

After a MAC binding server is specified on an interface, the device can implement MAC-based quick portal authentication for portal users on the interface.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Specify a MAC binding server on the interface.
   portal [**ipv6**] **apply mac-trigger-server** *server-name*
   By default, no MAC binding server is specified on an interface.

Configuring cloud MAC-trigger authentication

About this task

This feature enables the cloud portal server to act as a MAC binding server to perform cloud MAC-trigger authentication on portal users.

Procedure

1. Enter system view.
   system-view
2. Create a MAC binding server and enter its view.
   portal mac-trigger-server *server-name*
3. Enable cloud MAC-trigger authentication.
   cloud-binding enable
   By default, cloud MAC-trigger authentication is disabled.
4. Specify the URL of the cloud portal authentication server.
   cloud-server url *url-string*
   By default, the cloud portal authentication server URL is not specified. The device uses the URL of the portal Web server as the URL of the cloud portal authentication server.

Logging out online portal users

About this task

This feature deletes users that have passed portal authentication and terminates ongoing portal authentications.

Restrictions and guidelines

When the number of online users exceeds 2000, executing the **portal delete-user** command takes a few minutes.

To ensure successful logout of online users, do not perform the following operations during the command execution:

- Master/subordinate device switchover.
- Breaking the data channel in the VSRP group.

- Active/standby MPU switchover.
- Disabling portal authentication on the interface.

Procedure

1. Enter system view.

   system-view

2. Log out online portal users.

   portal delete-user { *ipv4-address* | **all** | **auth-type** { **cloud** | **local** | **normal** } | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* | **mac** *mac-address* }

Enabling portal user login/logout logging

About this task

This feature logs information about user login and logout events. The information includes the username, user IP address and MAC address, user access interface, VLAN, and login result. The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable portal user login/logout logging.

   portal log enable

   By default, portal user login/logout logging is disabled.

Disabling the Rule ARP or ND entry feature for portal clients

About this task

When the Rule ARP or ND entry feature is enabled for portal clients, ARP or ND entries for portal clients are Rule entries after the clients come online. After the portal clients go offline, the Rule ARP or ND entries are converted into dynamic entries and deleted when they age out.

Restrictions and guidelines

Enabling or disabling of this feature does not affect existing Rule/dynamic ARP or ND entries.

If the portal clients and the portal server belong to different VPNs, the Rule ARP entry feature will cause the portal clients to go offline abnormally. To avoid this issue, execute the **undo portal refresh arp enable** command to disable the Rule ARP entry feature for portal clients.

Procedure

1. Enter system view.

   system-view

2. Disable the Rule ARP or ND entry feature for portal clients.

   undo portal refresh { **arp** | **nd** } **enable**

   By default, the Rule ARP or ND entry feature is enabled for portal clients.

Configuring Web redirect

About this task

Web redirect is a simplified portal feature. With Web redirect, a user does not perform portal authentication but is directly redirected to the specified URL on the first Web access attempt in a browser. After the specified redirect interval, the user is redirected from the visiting website to the specified URL again.

Web redirect can provide ISPs with extended services. For example, the ISPs can place advertisements and publish information on the redirected webpage.

Restrictions and guidelines

The Web redirect feature takes effect only on HTTP packets that use the default port number 80.

If the device supports Etherchannel interfaces, you can enable both Web redirect and portal authentication on interfaces that support these features. If the device does not support Etherchannel interfaces, Web redirect does not work when both Web redirect and portal authentication are enabled on an interface.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Configure Web redirect.

   web-redirect [**ipv6**] **url** *url-string* [**interval** *interval*]

   By default, Web redirect is disabled.

Setting the user synchronization interval for portal authentication using OAuth

About this task

If portal authentication uses OAuth, the device periodically reports user information to the portal authentication server for user synchronization on the server. To disable user synchronization from the device to the portal authentication server, set the user synchronization interval to 0 seconds on the device.

Procedure

1. Enter system view.

   system-view
2. Set the user synchronization interval for portal authentication using OAuth.

   portal oauth user-sync interval *interval*

   By default, the user synchronization interval is 60 seconds.

Obtaining user access information from ARP or ND entries

About this task

In a remote Web authentication network, the device cannot obtain user access information from FIB entries upon receiving portal packets from the portal authentication server. This will cause users to fail Web authentication.

To resolve this issue, you can perform this task on the device. When this feature is enabled, the device first attempts to obtain user access information from ARP or ND entries during Web authentication.

Procedure

1. Enter system view.
   system-view
2. Configure the device to obtain user information from ARP or ND entries.
   portal access-info trust { **arp** | **nd** }
   By default, the device obtains user information from FIB entries.

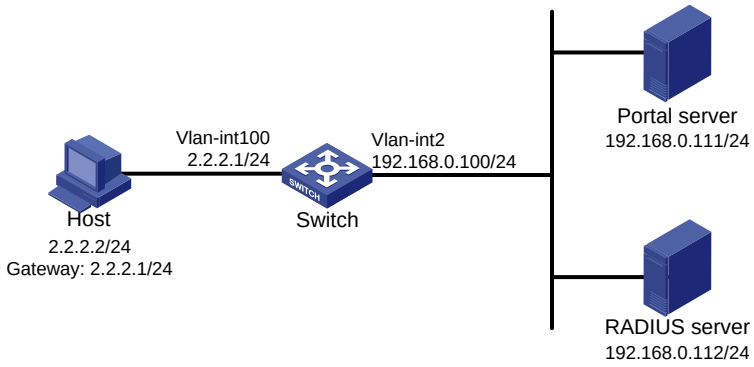
Display and maintenance commands for portal

Execute **display** commands in any view and the **reset** command in user view.

Task	Command
Display portal configuration and portal running state.	**display portal interface** *interface-type interface-number*
Display information about MAC binding servers.	**display portal mac-trigger-server** { **all** | **name** *server-name* }
Display packet statistics for portal authentication servers.	**display portal packet statistics** [**extend-auth-server cloud** | **server** *server-name*]
Display portal rules.	**display portal rule** { **all** | **dynamic** | **static** } **interface** *interface-type interface-number* [**slot** *slot-number*]
Display portal authentication server information.	**display portal server** [*server-name*]
Display session information for portal users or portal-based Web authentication users.	**display portal session user-type** { **portal** | **web-auth** }
Display portal user information.	**display portal user** { **all** | **auth-type** { **cloud** | **local** | **normal** } | **interface** *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address* | **mac** *mac-address* | **pre-auth** [**interface** *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address*] | **username** *username* } [**brief** | **verbose**]
Display portal Web server information.	**display portal web-server**

Task	Command
	[*server-name*]
Display Web redirect rule information.	**display web-redirect rule interface** *interface-type interface-number* [**slot** *slot-number*]
Clear packet statistics for portal authentication servers.	**reset portal packet statistics** [**extend-auth-server cloud** | **server** *server-name*]

Portal configuration examples



Example: Configuring direct portal authentication

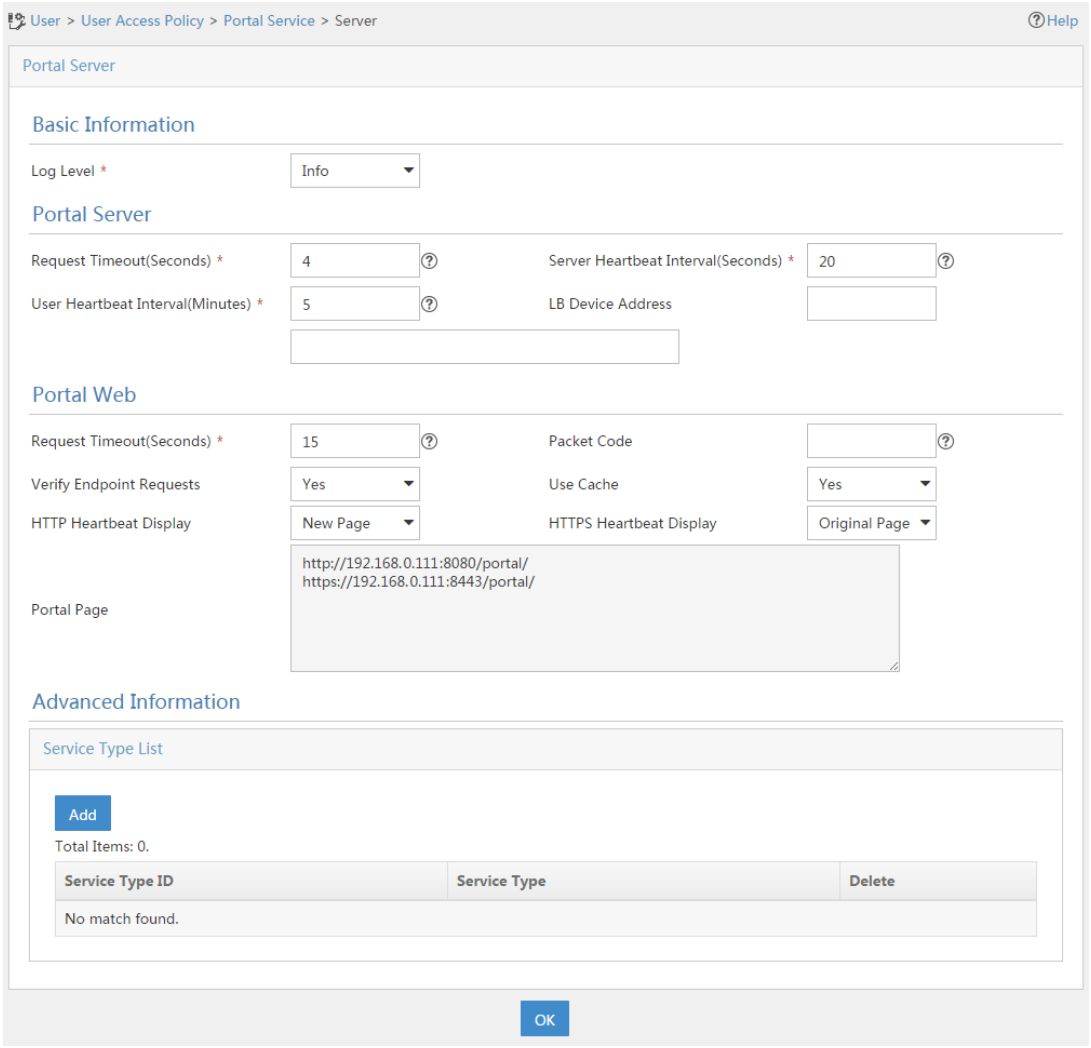
Network configuration

As shown in Figure 6, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. An IMC server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server. In this example, the IMC server runs IMC 7.1 (E0303) and IMC UAM 7.1 (E0304).

Configure direct portal authentication, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.

Figure 6 Network diagram

Prerequisites



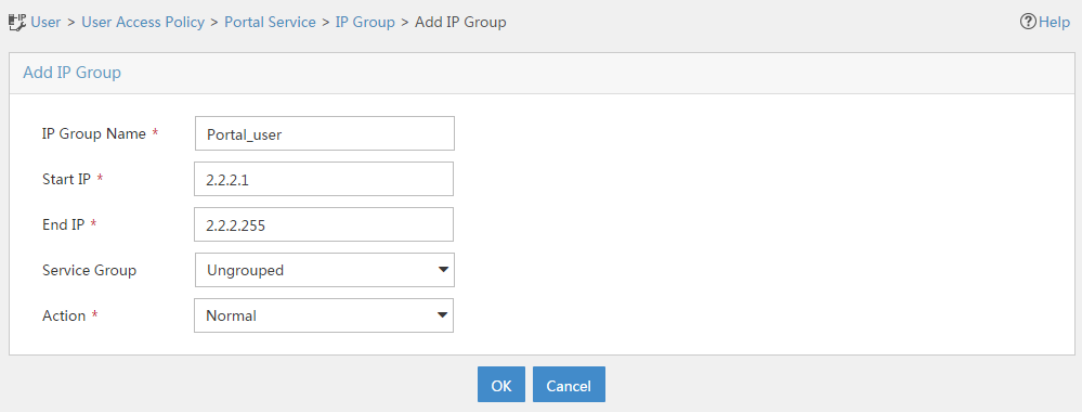
- Configure IP addresses for the host, switch, and servers as shown in Figure 6 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Configuring the portal server

1. Configure the portal server:
   a. Log in to IMC and click the **User** tab.
   b. Select **User Access Policy** > **Portal Service** > **Server** from the navigation tree to open the portal server configuration page, as shown in Figure 7.
   c. Configure the portal server parameters as needed.

      This example uses the default settings.
   d. Click **OK**.

Figure 7 Portal server configuration



2. Configure the IP address group:
   a. Select **User Access Policy** > **Portal Service** > **IP Group** from the navigation tree to open the portal IP address group configuration page.
   b. Click **Add** to open the page as shown in Figure 8.
   c. Enter the IP group name.
   d. Enter the start IP address and end IP address of the IP group.

      Make sure the host IP address is in the IP group.
   e. Select a service group.

      This example uses the default group **Ungrouped**.
   f. Select **Normal** from the **Action** list.
   g. Click **OK**.

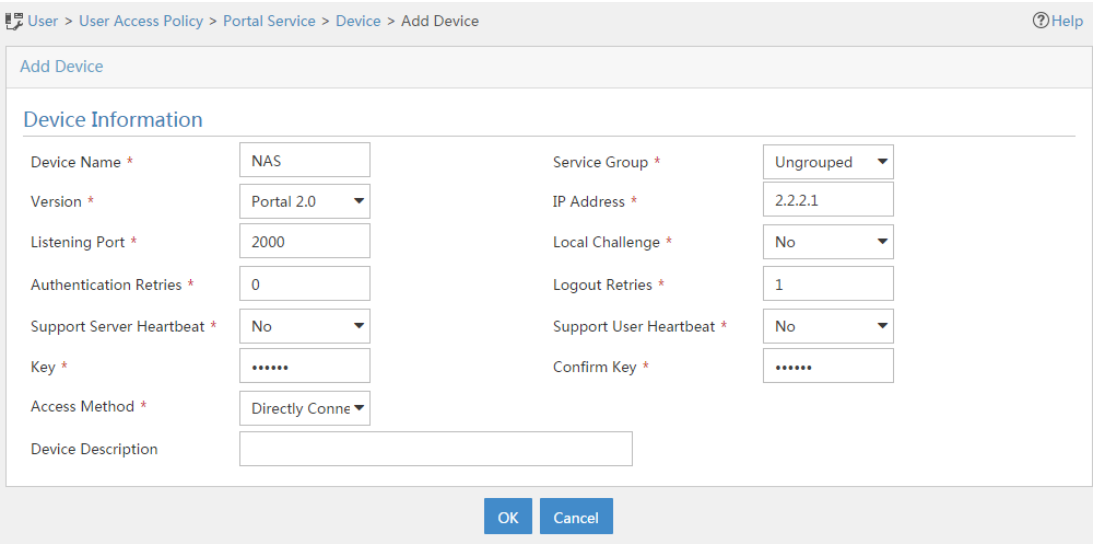


Figure 8 Adding an IP address group

3. Add a portal device:
   a. Select **User Access Policy** > **Portal Service** > **Device** from the navigation tree to open the portal device configuration page.
   b. Click **Add** to open the page as shown in Figure 9.
   c. Enter device name **NAS**.
   d. Enter the IP address of the switch's interface connected to the host.
   e. Set whether to support the portal server heartbeat and user heartbeat functions.

      In this example, select **No** for both **Support Server Heartbeat** and **Support User Heartbeat**.
   f. Enter the key, which must be the same as that configured on the switch.
   g. Select **Directly Connected** from the **Access Method** list.
   h. Use the default settings for other parameters.
   i. Click **OK**.

Figure 9 Adding a portal device

4. Associate the portal device with the IP address group:
   a. As shown in Figure 10, click the **Port Group Information Management** icon for device **NAS** to open the port group configuration page.
   b. Click **Add** to open the page as shown in Figure 11.

c. Enter the port group name.

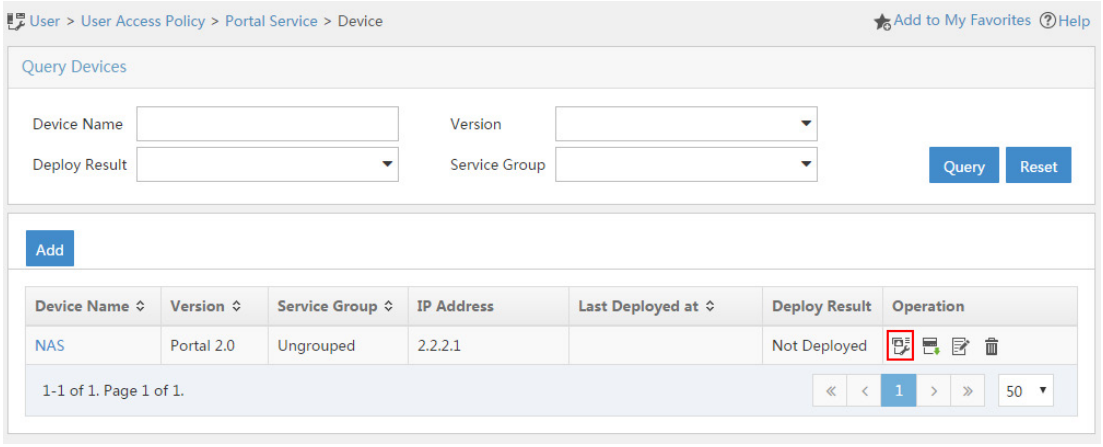
d. Select the configured IP address group.

   The IP address used by the user to access the network must be within this IP address group.

e. Use the default settings for other parameters.

f. Click **OK**.

Figure 10 Device list



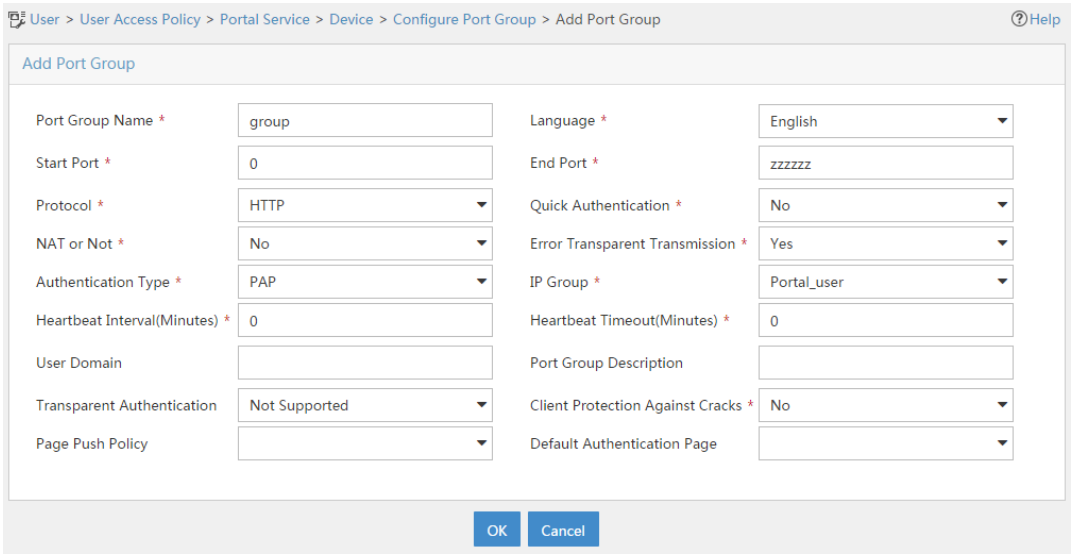


Figure 11 Adding a port group

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   ```

```
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
```

```
    Max users     : Not configured
 IPv4:
    Portal status: Enabled
    Portal authentication method: Direct    authentication shared mode: Disabled
    Portal web server: newpt(active)
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max users: Not configured
    Bas-ip: 2.2.2.1
    User detection:  Not configured
    Action for server detection:
        Server type    Server name                      Action
        --             --                               --
    Layer3 source network:
        IP address              Mask

    Destination authenticate subnet:
        IP address              Mask
IPv6:
    Portal status: Disabled
    Portal authentication method: Disabled    authentication shared mode: Disabled
    Portal web server: Not configured
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                      Action
        --             --                               --
    Layer3 source network:
        IP address                                      Prefix length

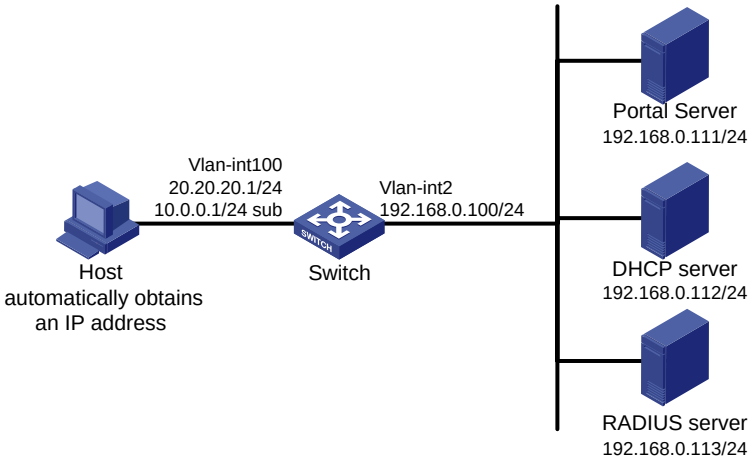
    Destination authenticate subnet:
        IP address                                      Prefix length
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
 Total portal users: 1
```

```
Username: abc
Portal server: newpt
State: Online
VPN instance: N/A
MAC               IP              VLAN   Interface
0015-e9a6-7cfe    2.2.2.2         100    Vlan-interface100
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL number: N/A
  Inbound CAR: N/A
  Outbound CAR: N/A
```



Example: Configuring re-DHCP portal authentication

Network configuration

As shown in Figure 12, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure re-DHCP portal authentication. Before passing the authentication, the host is assigned a private IP address. After passing the authentication, the host gets a public IP address and can access network resources.

Figure 12 Network diagram

Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.

- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 12 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.113
   [Switch-radius-rs1] primary accounting 192.168.0.113
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [Switch] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [Switch-isp-dm1] authentication portal radius-scheme rs1
   [Switch-isp-dm1] authorization portal radius-scheme rs1
   [Switch-isp-dm1] accounting portal radius-scheme rs1
   [Switch-isp-dm1] quit
   ```

   # Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

   ```
   [Switch] domain default enable dm1
   ```

3. Configure DHCP relay and authorized ARP:

   # Configure DHCP relay.

   ```
   [Switch] dhcp enable
   [Switch] dhcp relay client-information record
   [Switch] interface vlan-interface 100
   [Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
   [Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
   [Switch-Vlan-interface100] dhcp select relay
   [Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
   ```

   # Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A

     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
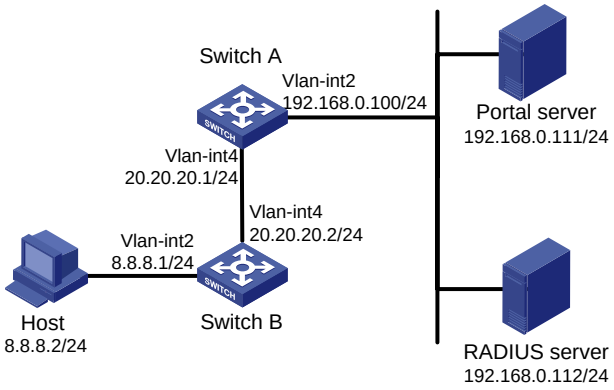
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address                                      Prefix length

     Destination authenticate subnet:
         IP address                                      Prefix length
```

Before passing the authentication, a user that uses the iNode client can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    20.20.20.2        100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
```



Example: Configuring cross-subnet portal authentication

Network configuration

As shown in Figure 13, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure Switch A for cross-subnet portal authentication. Before passing the authentication, the host can access only the portal Web server. After passing the authentication, the user can access other network resources.

Figure 13 Network diagram

Restrictions and guidelines

Make sure the IP address of the portal device added on the portal authentication server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 13 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<SwitchA> system-view
[SwitchA] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[SwitchA-radius-rs1] primary authentication 192.168.0.112
[SwitchA-radius-rs1] primary accounting 192.168.0.112
[SwitchA-radius-rs1] key authentication simple radius
[SwitchA-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[SwitchA-radius-rs1] user-name-format without-domain
[SwitchA-radius-rs1] quit
```

Enable RADIUS session control.

```
[SwitchA] radius session-control enable
```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [SwitchA] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [SwitchA-isp-dm1] authentication portal radius-scheme rs1
   [SwitchA-isp-dm1] authorization portal radius-scheme rs1
   [SwitchA-isp-dm1] accounting portal radius-scheme rs1
   [SwitchA-isp-dm1] quit
   ```

   # Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

   ```
   [SwitchA] domain default enable dm1
   ```

3. Configure portal authentication:

   # Configure a portal authentication server.

   ```
   [SwitchA] portal server newpt
   [SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
   [SwitchA-portal-server-newpt] port 50100
   [SwitchA-portal-server-newpt] quit
   ```

   # Configure a portal Web server.

   ```
   [SwitchA] portal web-server newpt
   [SwitchA-portal-websvr-newpt] url https://192.168.0.111:8080/portal
   [SwitchA-portal-websvr-newpt] quit
   ```

   # Enable cross-subnet portal authentication on VLAN-interface 4.

   ```
   [SwitchA] interface vlan-interface 4
   [SwitchA–Vlan-interface4] portal enable method layer3
   ```

   # Specify portal Web server **newpt** on VLAN-interface 4.

   ```
   [SwitchA–Vlan-interface4] portal apply web-server newpt
   ```

   # Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

   ```
   [SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
   [SwitchA–Vlan-interface4] quit
   ```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
     Max users     : Not configured
 IPv4:
     Portal status: Enabled
     Portal authentication method: Layer3
     Portal web server: newpt(active)
     Secondary portal Web server: Not configured
```

```
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: 20.20.20.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured(active)
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address                                      Prefix length

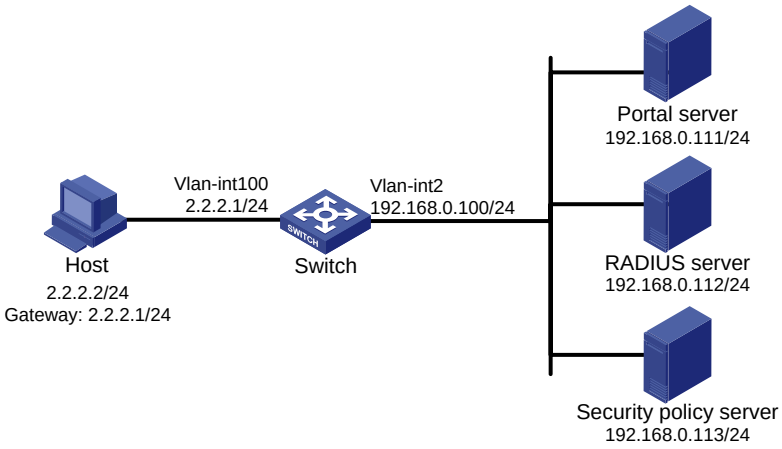
     Destination authenticate subnet:
         IP address                                      Prefix length
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP               VLAN   Interface
  0000-0000-0000    8.8.8.2          4      Vlan-interface4
```

```
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL number: N/A
  Inbound CAR: N/A
  Outbound CAR: N/A
```



Example: Configuring extended direct portal authentication

Network configuration

As shown in Figure 14, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure extended direct portal authentication. If the host fails security check after passing identity authentication, it can access only subnet 192.168.0.0/24. After passing security check, the host can access other network resources.

Figure 14 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and servers as shown in Figure 14 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key accounting simple radius
   [Switch-radius-rs1] key authentication simple radius
   ```

```
[Switch-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

```
[Switch] radius session-control client ip 192.168.0.112 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named dm1 and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain dm1 as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
    [Switch–Vlan-interface100] portal bas-ip 2.2.2.1
    [Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A

     Portal status: Enabled
     Portal authentication method: Direct    authentication shared mode: Disabled
     Portal web server: newpt(active)
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: 2.2.2.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                        Action
         --             --                                 --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                        Action
         --             --                                 --
```

```
Layer3 source network:
    IP address                                      Prefix length

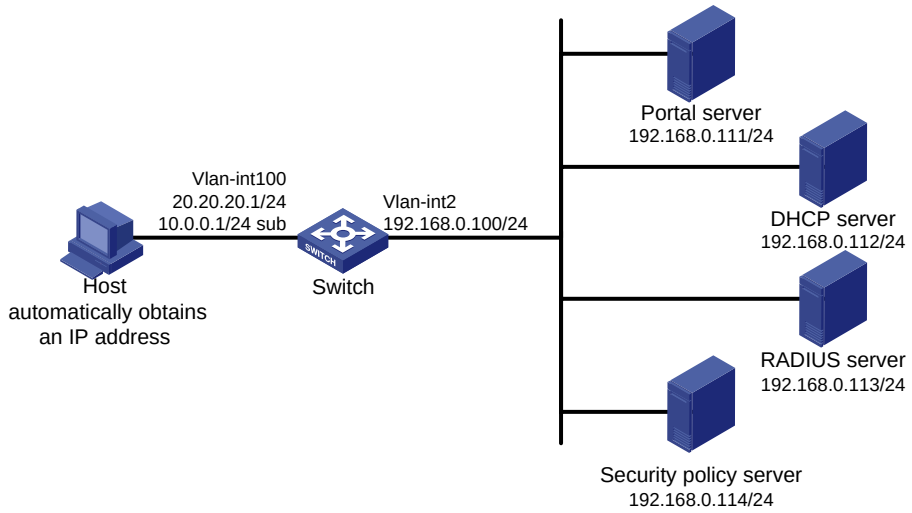
Destination authenticate subnet:
    IP address                                      Prefix length
```

Before passing portal authentication, a user that uses the iNode client can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.
- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL: 3001
    Inbound CAR: N/A
    Outbound CAR: N/A
```



Example: Configuring extended re-DHCP portal authentication

Network configuration

As shown in Figure 15, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure extended re-DHCP portal authentication. Before passing portal authentication, the host is assigned a private IP address. After passing portal identity authentication, the host obtains a public IP address and accepts security check. If the host fails the security check, it can access only subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 15 Network diagram

Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.
- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 15 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.113
[Switch-radius-rs1] primary accounting 192.168.0.113
[Switch-radius-rs1] key accounting simple radius
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.113 and shared key 12345 in plaintext form.

```
[Switch] radius session-control client ip 192.168.0.113 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure DHCP relay and authorized ARP:

Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

5. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking

Pre-auth IP pool: Not configured
Max users: Not configured
Bas-ipv6: Not configured
User detection: Not configured
Action for server detection:
    Server type    Server name                          Action
    --             --                                   --
Layer3 source network:
    IP address                                          Prefix length

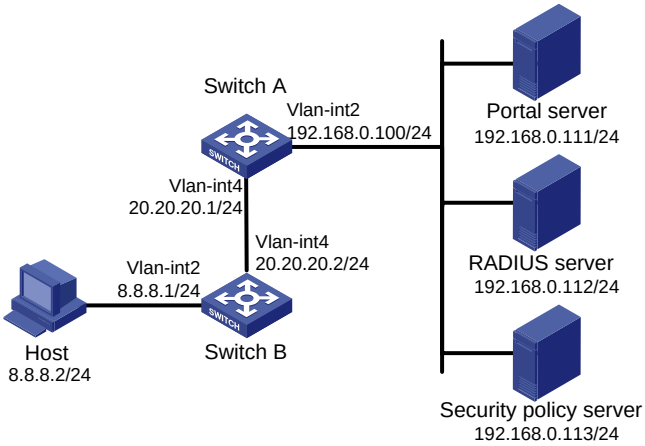
Destination authenticate subnet:
    IP address                                          Prefix length
```

Before passing portal authentication, a user that uses the iNode client can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.
- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    20.20.20.2        100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
```



Example: Configuring extended cross-subnet portal authentication

Network configuration

As shown in Figure 16, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure Switch A for extended cross-subnet portal authentication. Before passing portal authentication, the host can access only the portal server. After passing portal identity authentication, the host accepts security check. If the host fails the security check it can access only the subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 16 Network diagram

Restrictions and guidelines

Make sure the IP address of the portal device added on the portal server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 16 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <SwitchA> system-view
   [SwitchA] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [SwitchA-radius-rs1] primary authentication 192.168.0.112
   [SwitchA-radius-rs1] primary accounting 192.168.0.112
   [SwitchA-radius-rs1] key accounting simple radius
   [SwitchA-radius-rs1] key authentication simple radius
   [SwitchA-radius-rs1] user-name-format without-domain
   ```

   # Enable RADIUS session control.

   ```
   [SwitchA] radius session-control enable
   ```

   # Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

   ```
   [SwitchA] radius session-control client ip 192.168.0.112 key simple 12345
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [SwitchA] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

```
[SwitchA-isp-dm1] authentication portal radius-scheme rs1
[SwitchA-isp-dm1] authorization portal radius-scheme rs1
[SwitchA-isp-dm1] accounting portal radius-scheme rs1
[SwitchA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[SwitchA] acl advanced 3000
[SwitchA-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[SwitchA-acl-ipv4-adv-3000] rule deny ip
[SwitchA-acl-ipv4-adv-3000] quit
[SwitchA] acl advanced 3001
[SwitchA-acl-ipv4-adv-3001] rule permit ip
[SwitchA-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 4.

```
[SwitchA] interface vlan-interface 4
[SwitchA–Vlan-interface4] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 4.

```
[SwitchA–Vlan-interface4] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

```
[SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
[SwitchA–Vlan-interface4] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
```

```
    ACL           : Disabled
    User profile  : Disabled
    Max users     : Not configured

        --             --                                  --
    Layer3 source network:
        IP address                                         Prefix length

    Destination authenticate subnet:
        IP address                                         Prefix length
```

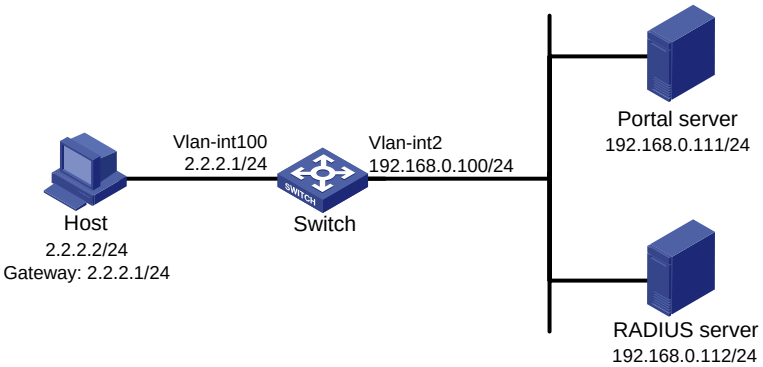
Before passing portal authentication, a user that uses the iNode client can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.

- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC                IP                VLAN   Interface
  0015-e9a6-7cfe     8.8.8.2           4    Vlan-interface4
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
```



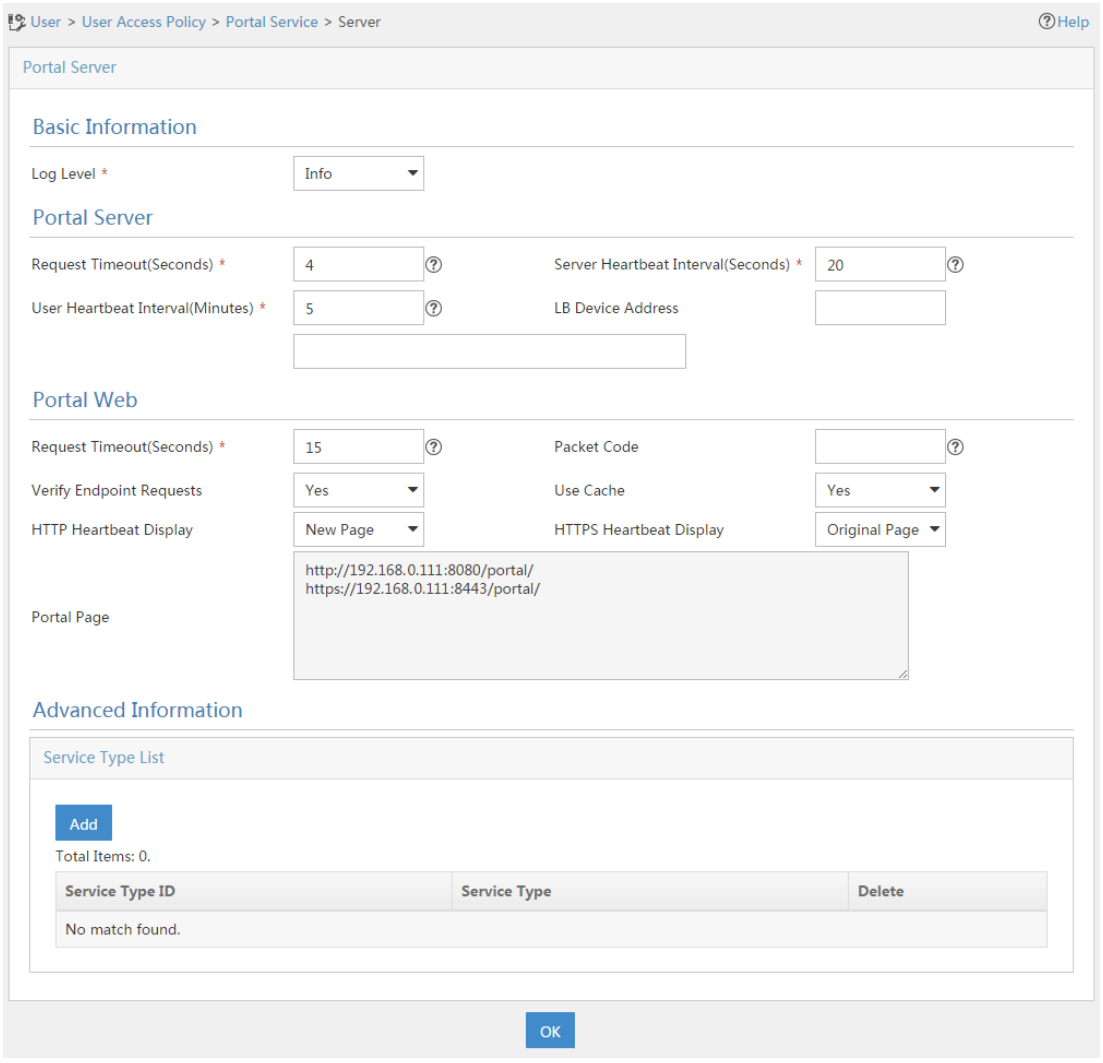
Example: Configuring portal server detection and portal user synchronization

Network configuration

As shown in Figure 17, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. An IMC server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server. In this example, the IMC server runs IMC 7.1 (E0303) and IMC UAM 7.1 (E0304).

- Configure direct portal authentication on the switch, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.
- Configure the switch to detect the reachability state of the portal authentication server, send log messages upon state changes, and disable portal authentication when the authentication server is unreachable.
- Configure the switch to synchronize portal user information with the portal server periodically.

Figure 17 Network diagram



Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 17 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Configuring the portal server

1. Configure the portal server:
   a. Log in to IMC and click the **User** tab.
   b. Select **User Access Policy** > **Portal Service** > **Server** from the navigation tree to open the portal server configuration page, as shown in Figure 18.
   c. Configure the portal server parameters as needed.
      This example uses the default settings.
   d. Click **OK**.

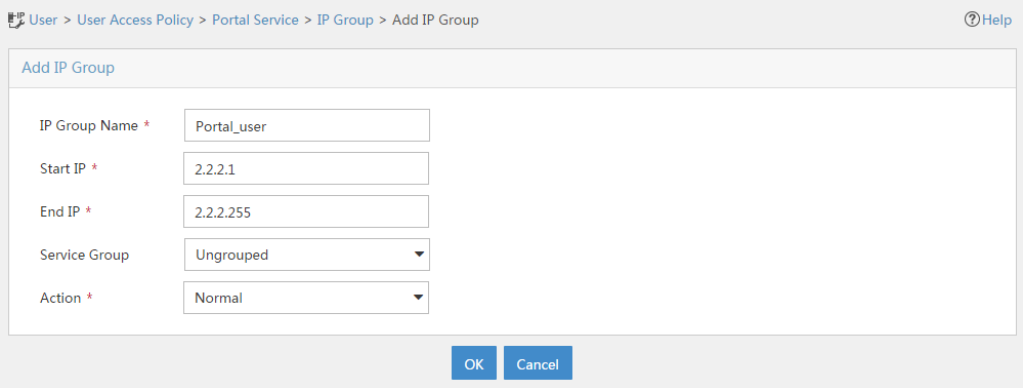


Figure 18 Portal server configuration

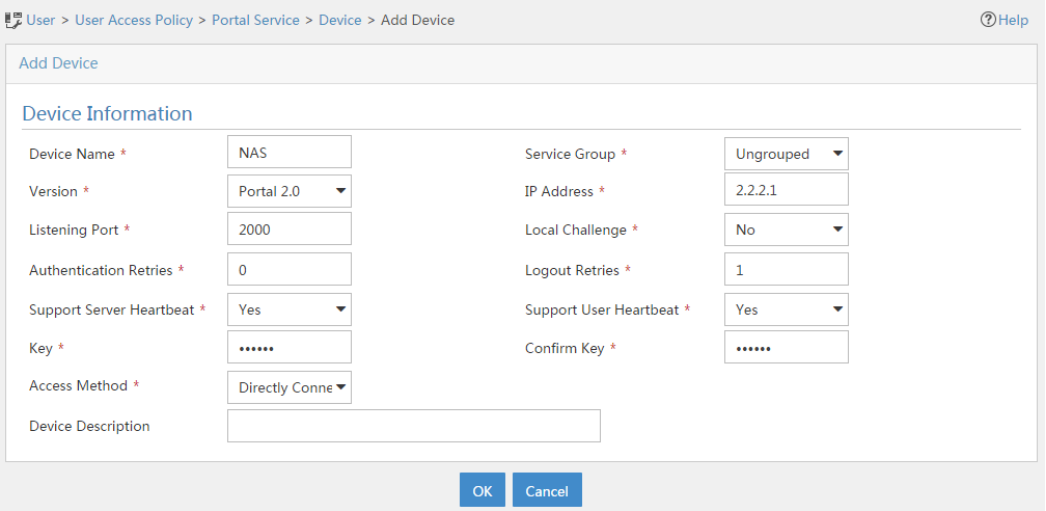
2. Configure the IP address group:
   a. Select **User Access Policy** > **Portal Service** > **IP Group** from the navigation tree to open the portal IP address group configuration page.
   b. Click **Add** to open the page as shown in Figure 19.



c. Enter the IP group name.
d. Enter the start IP address and end IP address of the IP group.
   Make sure the host IP address is in the IP group.
e. Select a service group.
   This example uses the default group **Ungrouped**.
f. Select **Normal** from the **Action** list.
g. Click **OK**.

Figure 19 Adding an IP address group

3. Add a portal device:
   a. Select **User Access Policy** > **Portal Service** > **Device** from the navigation tree to open the portal device configuration page.
   b. Click **Add** to open the page as shown in Figure 20.
   c. Enter device name **NAS**.
   d. Enter the IP address of the switch's interface connected to the host.
   e. Set whether to support the portal server heartbeat and user heartbeat functions.
      In this example, select **Yes** for both **Support Server Heartbeat** and **Support User Heartbeat**.
   f. Enter the key, which must be the same as that configured on the switch.
   g. Select **Directly Connected** from the **Access Method** list.
   h. Use the default settings for other parameters.
   i. Click **OK**.

Figure 20 Adding a portal device

4. Associate the portal device with the IP address group:

   a. As shown in Figure 21, click the **Port Group Information Management** icon for device **NAS** to open the port group configuration page.

   b. Click **Add** to open the page as shown in Figure 22.

   c. Enter the port group name.

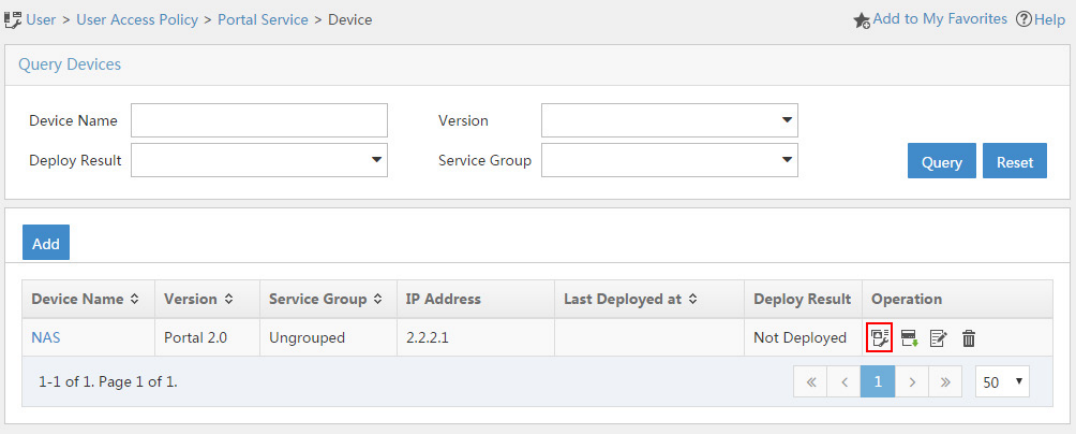
   d. Select the configured IP address group.

      The IP address used by the user to access the network must be within this IP address group.

   e. Use the default settings for other parameters.

   f. Click **OK**.

Figure 21 Device list



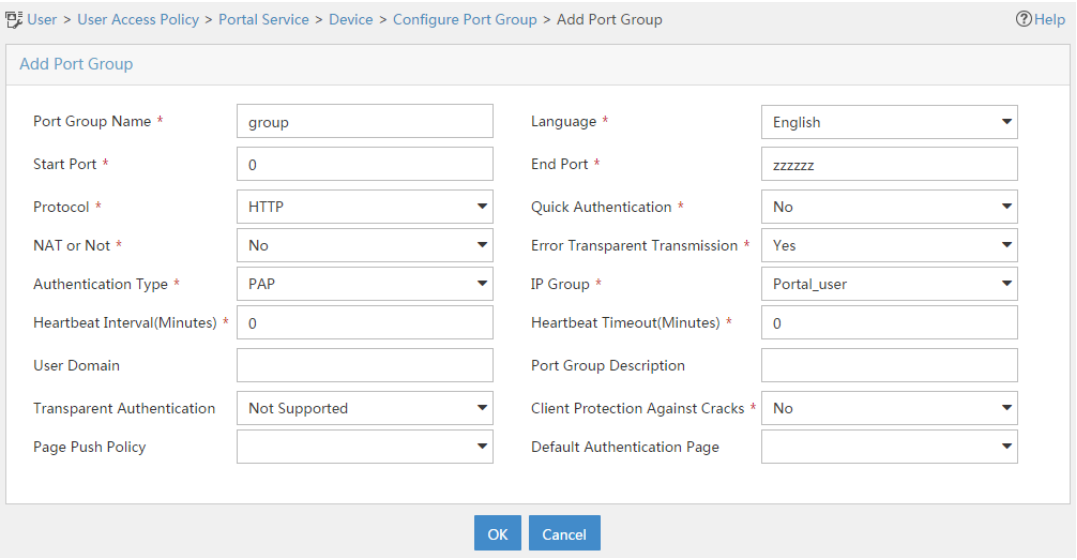


Figure 22 Adding a port group

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [Switch] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [Switch-isp-dm1] authentication portal radius-scheme rs1
   [Switch-isp-dm1] authorization portal radius-scheme rs1
   [Switch-isp-dm1] accounting portal radius-scheme rs1
   [Switch-isp-dm1] quit
   ```

   # Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

   ```
   [Switch] domain default enable dm1
   ```

3. Configure portal authentication:

   # Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
```

Configure reachability detection of the portal authentication server: set the server detection interval to 40 seconds, and send log messages upon reachability status changes.

```
[Switch-portal-server-newpt] server-detect timeout 40 log
```

NOTE:

The value of **timeout** must be greater than or equal to the portal server heartbeat interval.

Configure portal user synchronization with the portal authentication server, and set the synchronization detection interval to 600 seconds.

```
[Switch-portal-server-newpt] user-sync timeout 600
[Switch-portal-server-newpt] quit
```

NOTE:

The value of **timeout** must be greater than or equal to the portal user heartbeat interval.

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Enable portal fail-permit for the portal authentication server **newpt**.

```
[Switch–Vlan-interface100] portal fail-permit server newpt
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

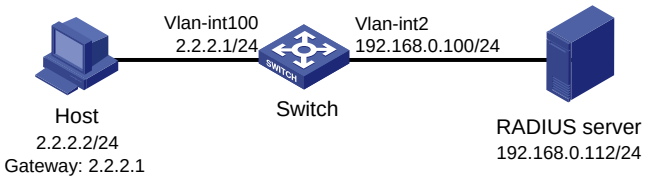
Verifying the configuration

Use the following command to display information about the portal authentication server.

```
[Switch] display portal server newpt
Portal server: newpt
  Type                 : IMC
  IP                   : 192.168.0.111
  VPN instance         : Not configured
  Port                 : 50100
  Server Detection     : Timeout 40s  Action: log
  User synchronization : Timeout 600s
  Status               : Up
  SSL client policy    : Not configured
```

The **Up** status of the portal authentication server indicates that the portal authentication server is reachable. If the access device detects that the portal authentication server is unreachable, the **Status** field in the command output displays **Down**. The access device generates a server

unreachable log "Portal server newpt turns down from up." and disables portal authentication on the access interface, so the host can access the external network without authentication.



Example: Configuring direct portal authentication using a local portal Web service

Network configuration

As shown in Figure 23, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. The switch acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure direct portal authentication on the switch. Before a user passes portal authentication, the user can access only the portal Web server. After passing portal authentication, the user can access other network resources.

Figure 23 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and server as shown in Figure 23 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

   # Create an ISP domain named **dm1** and enter its view.

   ```
   [Switch] domain dm1
   ```

   # Configure AAA methods for the ISP domain.

   ```
   [Switch-isp-dm1] authentication portal radius-scheme rs1
   ```

```
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal Web server named **newpt** and specify **https://2.2.2.1:2331/portal** as the URL of the portal Web server. The IP address in the URL must be the IP address of a Layer 3 interface reachable to portal clients or a loopback interface (except 127.0.0.1) on the device.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://2.2.2.1:2331/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
[Switch–Vlan-interface100] quit
```

Create an HTTP-based local portal Web service and enter its view.

```
[Switch] portal local-web-server http
```

Specify file **defaultfile.zip** as the default authentication page file for the local portal Web service. (Make sure the file exists under the root directory of the switch.)

```
[Switch–portal-local-websvr-http] default-logon-page defaultfile.zip
```

Set the HTTP listening port number to 2331 for the local portal Web service.

```
[Switch–portal-local-webserver-http] tcp-port 2331
[Switch–portal-local-websvr-http] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface 100
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization                  Strict checking
     ACL                            Disabled
     User profile                   Disabled

     Portal web server: newpt(active)
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: Not configured
```

```
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                          Action
         --             --                                   --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                          Action
         --             --                                   --
     Layer3 source network:
         IP address                                          Prefix length

     Destination authenticate subnet:
         IP address                                          Prefix length
```

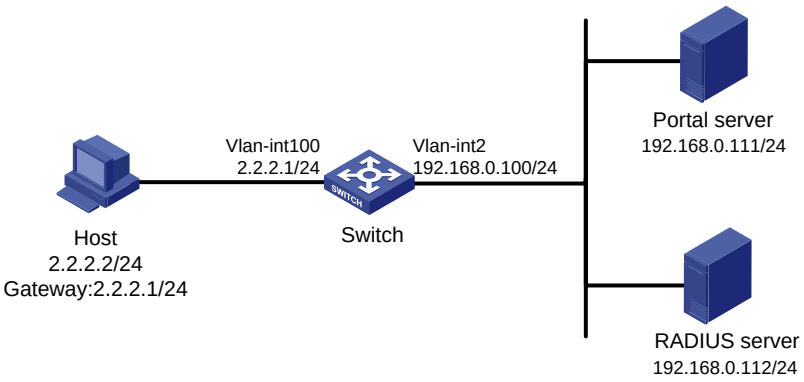
A user can perform portal authentication through a Web page. Before passing the authentication, the user can access only the authentication page **https://2.2.2.1:2331/portal** and all Web requests will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100     Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
```

```
Outbound CAR: N/A
```

Example: Configuring MAC-based quick portal authentication



Network configuration

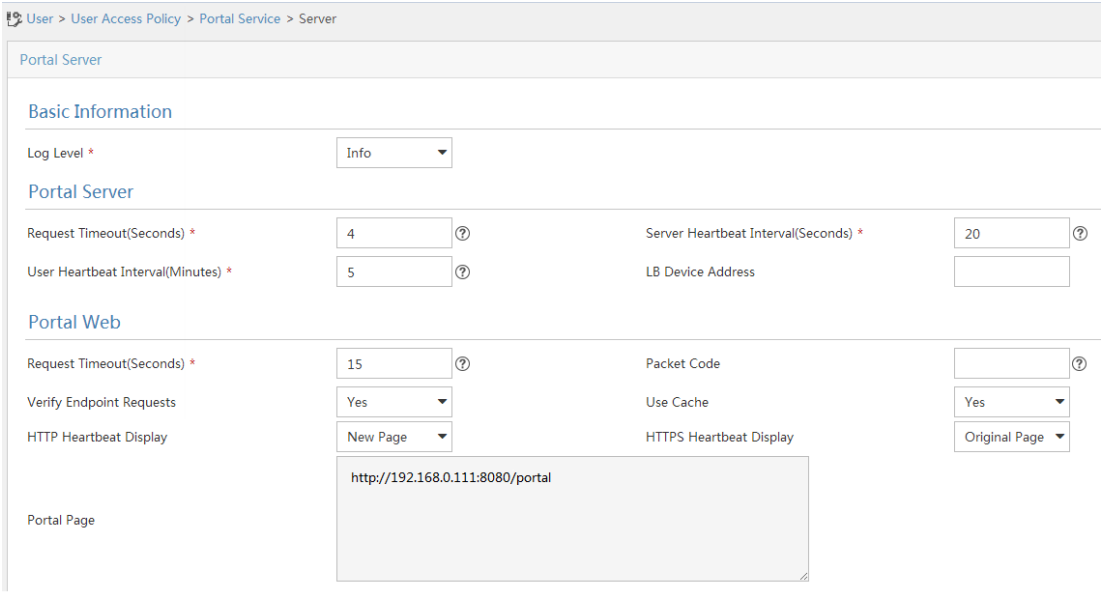
As shown in Figure 24, the host accesses the network through the switch. The host is assigned a public IP address either manually or through DHCP.

An IMC server acts as a portal server (portal authentication server and portal Web server) and a MAC binding server. A RADIUS server acts as the authentication and accounting server. In this example, the IMC server runs IMC 7.1 (E0303) and IMC UAM 7.1 (E0304).

Configure direct portal authentication, so the host can access only the portal Web server before passing the authentication and can access other network resources after passing the authentication.

Figure 24 Network diagram

Prerequisites



- Configure IP addresses for the host, switch, and servers as shown in Figure 24 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Configuring the portal server

1. Configure the portal server:
   a. Log in to IMC and click the **User** tab.
   b. Select **User Access Policy** > **Portal Service** > **Server** from the navigation tree to open the portal server configuration page, as shown in Figure 25.
   c. Configure the portal server parameters as needed.

      This example uses the default settings.
   d. Click **OK**.

Figure 25 Portal server configuration

2. Configure the IP address group:
   a. Select **User Access Policy** > **Portal Service** > **IP Group** from the navigation tree to open the portal IP address group configuration page.
   b. Click **Add** to open the page as shown in Figure 26.
   c. Enter the IP group name.
   d. Enter the start IP address and end IP address of the IP group.
      Make sure the client IP address (2.2.2.2) is in the IP group.
   e. Select a service group.
      This example uses the default group **Ungrouped**.
   f. Select **Normal** from the **Action** list.
   g. Click **OK**.

Figure 26 Adding an IP address group

3. Add a portal device:
   a. Select **User Access Policy** > **Portal Service** > **Device** from the navigation tree to open the portal device configuration page.

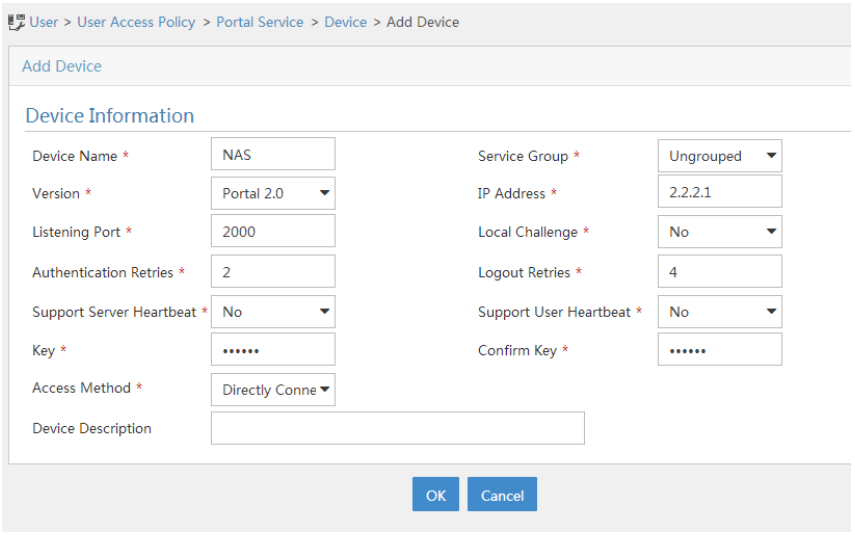
b. Click **Add** to open the page as shown in Figure 27.

c. Enter the device name.

d. Enter the IP address of the switch's interface connected to the host.

e. Set whether to support the portal server heartbeat and user heartbeat functions.

In this example, select **No** for both **Support Server Heartbeat** and **Support User Heartbeat**.



f. Enter the key, which must be the same as that configured on the switch.

g. Select **Directly Connected** from the **Access Method** list.

h. Use the default settins for other parameters.

i. Click **OK**.

Figure 27 Adding a portal device

4. Associate the portal device with the IP address group:

a. As shown in Figure 28, click the **Port Group Information Management** icon for device **NAS** to open the port group configuration page.

b. Click **Add** to open the page as shown in Figure 29.

c. Enter the port group name.

d. Select the configured IP address group.

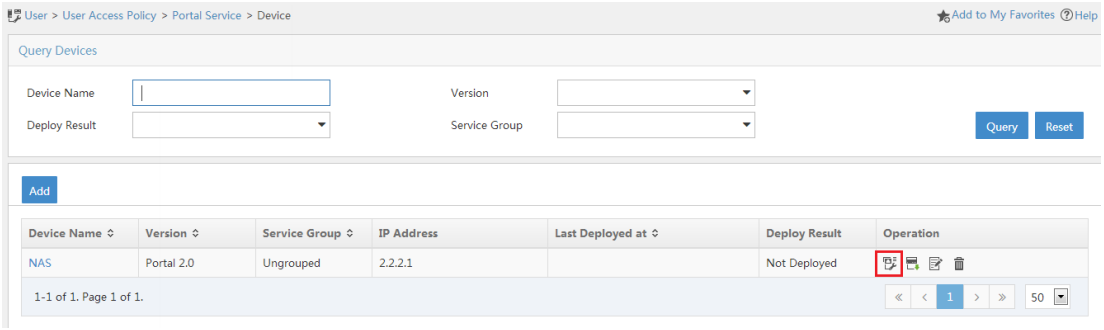
The IP address used by the user to access the network must be within this IP address group.

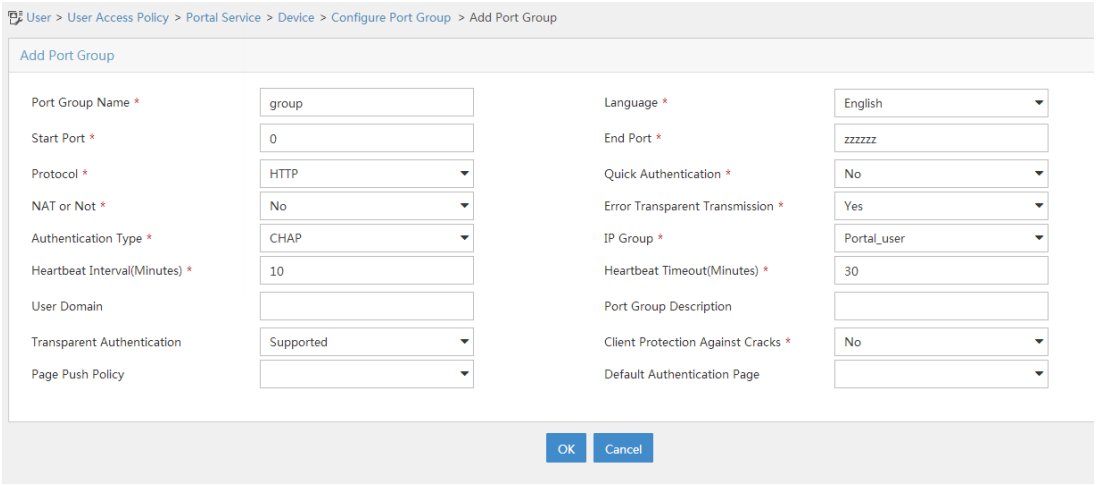
e. Select **Supported** for **Transparent Authentication**.

f. Use the default settings for other parameters.

g. Click **OK**.

Figure 28 Device list





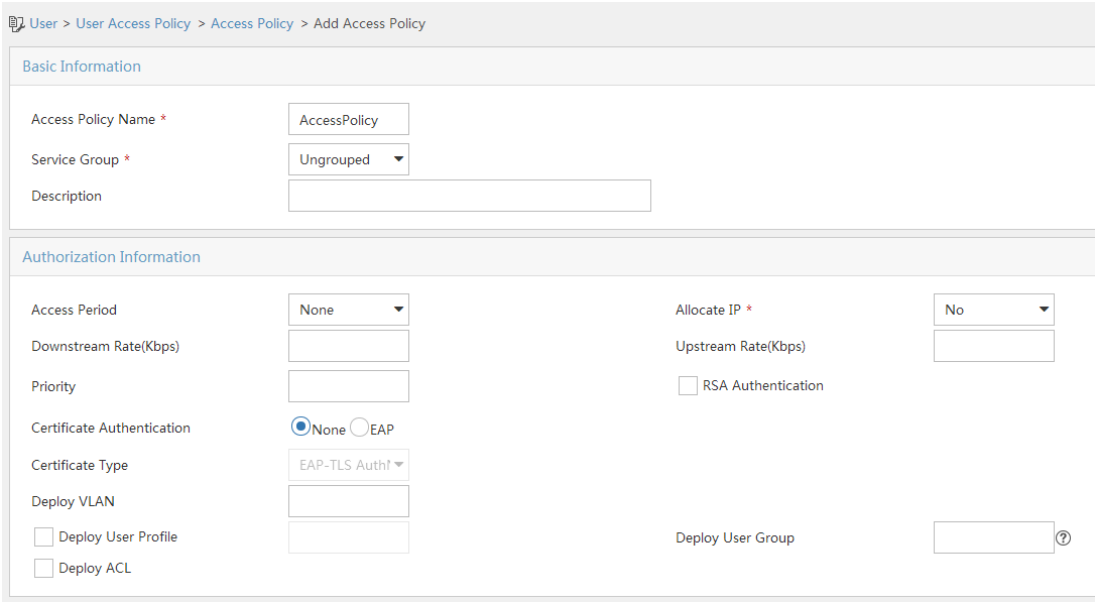


Figure 29 Adding a port group

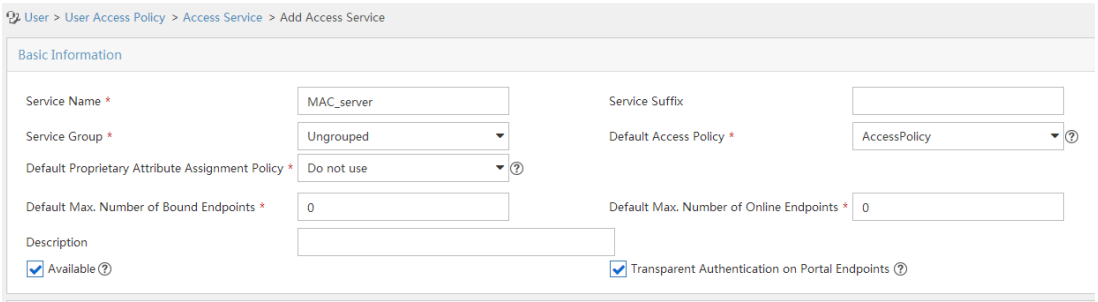
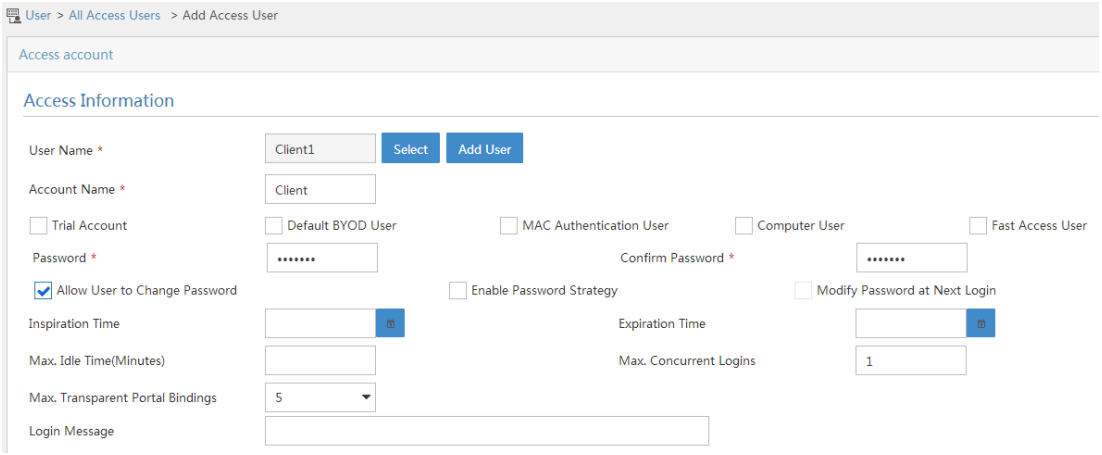
Configuring the MAC binding server



1. Add an access policy:
   a. Select **User Access Policy** > **Access Policy** from the navigation tree to open the access policy page.
   b. Click **Add** to open the page as shown in Figure 30.
   c. Enter the access policy name.
   d. Select a service group.
   e. Use the default settings for other parameters.
   f. Click **OK**.

Figure 30 Adding an access policy



2. Add an access service:
   a. Select **User Access Policy** > **Access Service** from the navigation tree to open the access service page.
   b. Click **Add** to open the page as shown in Figure 31.
   c. Enter the service name.
   d. Select the **Transparent Authentication on Portal Endpoints** option.
   e. Use the default settings for other parameters.
   f. Click **OK**.

Figure 31 Adding an access service

3. Add an access user:
   a. Select **Access User** > **All Access Users** from the navigation tree to open the access user page.
   b. Click **Add** to open the page as shown in Figure 32.
   c. Select an access user.
   d. Set the password.
   e. Select a value from the **Max. Transparent Portal Bindings** list.
   f. Click **OK**.

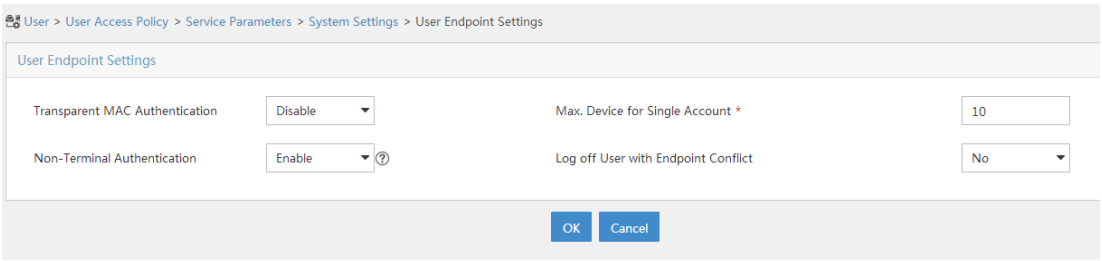
Figure 32 Adding an access user

4. Configure system parameters:
   a. Select **User Access Policy** > **Service Parameters** > **System Settings** from the navigation tree to open the system settings page.
   b. Click the **Configure** icon for **User Endpoint Settings** to open the page as shown in Figure 33.
   c. Select whether to enable transparent portal authentication on non-smart devices.

      In this example, select **Enable** for **Non-Terminal Authentication**.
   d. Click **OK**.
   e. Click the **Configure** icon for **Endpoint Aging Time** to open the page as shown in Figure 34.
   f. Set the endpoint aging time as needed.

      This example uses the default value.

Figure 33 Configuring user endpoint settings



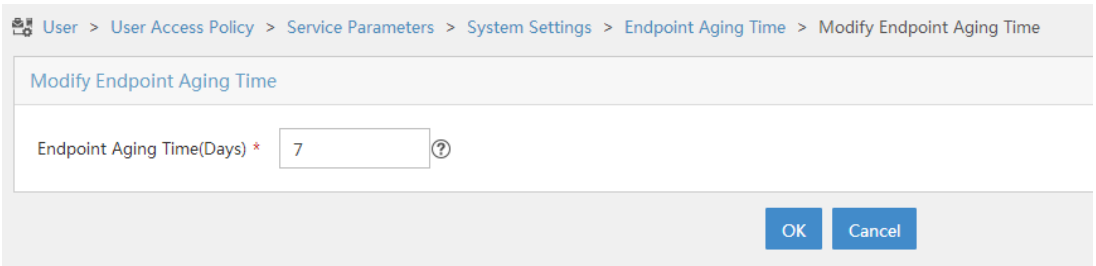


Figure 34 Setting the endpoint aging time

Configuring the switch

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url https://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal enable method direct
```

Specify the portal Web server **newpt** on VLAN-interface 100.

```
[Switch-Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch-Vlan-interface100] portal bas-ip 2.2.2.1
[Switch-Vlan-interface100] quit
```

4. Configure MAC-based quick portal authentication:

Create the MAC binding server **mts**.

```
[Switch] portal mac-trigger-server mts
```

Set the free-traffic threshold for portal users to 1024000 bytes.

```
[Switch-portal-mac-trigger-server-mts] free-traffic threshold 1024000
```

Specify the IP address of the MAC binding server as 192.168.0.111.

```
[Switch-portal-mac-trigger-server-mts] ip 192.168.0.111
[Switch-portal-mac-trigger-server-mts] quit
```

Specify the MAC binding server **mts** on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal apply mac-trigger-server mts
[Switch-Vlan-interface100] quit
```

Verifying the configuration

Display information about the MAC binding server.

```
[Switch] display portal mac-trigger-server name mts
Portal mac trigger server name: mts
  Version                    : 1.0
  Server type                : IMC
  IP                         : 192.168.0.111
  Port                       : 50100
  VPN instance               : Not configured
  Aging time                 : 300 seconds
  Free-traffic threshold     : 1024000 bytes
  NAS-Port-Type              : Not configured
  Binding retry times        : 3
  Binding retry interval     : 1 seconds
  Authentication timeout     : 3 minutes
  SSL client policy          : Not configured
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **https://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

For the first portal authentication, the user is required to enter the username and password. When the user goes offline and then accesses the network again, the user does not need to enter the authentication username and password.

Display portal user information.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: Client1
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface

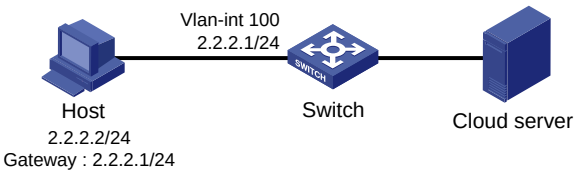
```



Example: Configuring cloud MAC-trigger authentication

Network configuration

As shown in Figure 35, the host accesses the network through the switch. The host is assigned a public IP address either manually or through DHCP. A cloud server acts as a portal server (portal authentication server and portal Web server) and a MAC binding server.

Configure MAC-trigger authenticaiton (MAC-based quick portal authentication) that uses the cloud server, so the user can access only the portal Web server before passing the authentication and can access other network resources after passing the authentication. The user can pass portal authentication without entering a username or password when the user tries to come online again.

Figure 35 Network diagram

Configuring the cloud server

On the Oasis platform, enable **Auth free for reconnect** on the authentication template for the AC. (Details not shown.)

Configuring the switch

1. Configure IP addresses for the host, switch, and server and make sure they can reach each other. (Details not shown.)
2. Configure basic network functions:

   # Create VLAN 100. The host will use this VLAN to access the network.

   ```
   <Switch> system-view
   [Switch] vlan 100
   [Switch-vlan100] quit
   ```

   # Assign an IP address to the VLAN interface. (Details not shown.)

   # Enable DNS proxy.

   ```
   [Switch] dns proxy enable
   ```

3. Configure an authentication domain:

   # Create an ISP domain named **cloud** and enter its view.

   ```
   [Switch] domain cloud
   ```

   # Configure AAA methods for portal users in the ISP domain as none.

   ```
   [Switch-isp-cloud] authentication portal none
   [Switch-isp-cloud] authorization portal none
   [Switch-isp-cloud] accounting portal none
   [Switch-isp-cloud] quit
   ```

4. Configure cloud MAC-trigger authentication:

   # Configure a portal Web server named **wbs**.

   ```
   [Switch] portal web-server wbs
   [Switch-portal-websvr-wbs] url https://oasisauth.h3c.com
   [Switch-portal-websvr-wbs] server-type oauth
   [Switch-portal-websvr-wbs] url-parameter nas_id value
   cm-0-554212-210235A2G1B205000009
   [Switch-portal-websvr-wbs] url-parameter template_id value 4291
   ```

Create an HTTP-based local portal Web service and enter its view.

```
[Switch] portal local-web-server http
```

Enable cloud MAC-trigger authentication.

```
[Switch] portal mac-trigger-server abc
[Switch-portal-extend-auth-server-abc] cloud-binding enable
```

Specify **https://oasisauth.h3c.com** as the URL of the cloud portal authentication server.

```
[Switch-portal-extend-auth-server-abc] cloud-server url https://oasisauth.h3c.com
[Switch-portal-extend-auth-server-abc] quit
```

Enable direct portal authentication on interface VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal enable method direct
```

Specify the authentication domain, portal Web server, and MAC binding server on interface VLAN-interface 100.

```
[Switch-Vlan-interface100] portal domain cloud
[Switch-Vlan-interface100] portal apply web-server cloud
[Switch-Vlan-interface100] portal apply mac-trigger-server abc
```

Verifying the configuration

Display packet statistics for the cloud portal authentication server.

```
[Switch] display portal packet statistics extend-auth-server cloud
Extend-auth server : cloud
  Pkt-Type           Success      Error      Timeout      Conn-failure
  REQ_ACCESSTOKEN    1            0          0            0
  REQ_USERINFO       1            0          0            0
  RESP_ACCESSTOKEN   1            0          0            0
  RESP_USERINFO      1            0          0            0
  POST_ONLINEDATA    10           0          0            0
  RESP_ONLINEDATA    10           0          0            0
  POST_OFFLINEUSER   1            0          0            0
  REPORT_ONLINEUSER  2            0          0            0
  REQ_CLOUDBIND      2            0          0            0
  ESP_CLOUDBIND      2            0          0            0
  REQ_BINDUSERINFO   1            0          0            0
  RESP_BINDUSERINFO  1            0          0            0
  AUTHENTICATION     2            0          0            0
```

Before passing portal authentication, a user can access only the portal authentication page **https://oasisauth.h3c.com**. All Web requests from the user will be redirected to the portal authentication page. After passing portal authentication, the user can access other network resources.

The user needs to enter the username and password for the first authentication. If the user goes offline and then tries to come online, the user can directly access the network resources without entering the username and password.

Display information about portal users.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: Client1
  Portal server: newpt
  State: Online
  VPN instance: N/A
```

```
MAC               IP                VLAN   Interface
0015-e9a6-7cfe    2.2.2.2           --     vlan-interface 100
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL number: N/A
  Inbound CAR: N/A
  Outbound CAR: N/A
```

Troubleshooting portal

No portal authentication page is pushed for users

Symptom

When a user is redirected to the IMC portal authentication server, no portal authentication page or error message is prompted for the user. The login page is blank.

Analysis

The key configured on the portal access device and that configured on the portal authentication server are inconsistent. As a result, packet verification fails, and the portal authentication server refuses to push the authentication page.

Solution

Use the **display this** command in portal authentication server view on the access device to check whether a key is configured for the portal authentication server.

- If no key is configured, configure the right key.
- If a key is configured, use the **ip** or **ipv6** command in the portal authentication server view to correct the key, or correct the key configured for the access device on the portal authentication server.

Cannot log out portal users on the access device

Symptom

You cannot use the **portal delete-user** command on the access device to log out a portal user, but the portal user can log out by clicking the **Disconnect** button on the portal authentication client.

Analysis

When you execute the **portal delete-user** command on the access device to log out a user, the access device sends an unsolicited logout notification message to the portal authentication server. The destination port number in the logout notification is the listening port number of the portal authentication server configured on the access device. If this listening port number is not the actual listening port number configured on the server, the server cannot receive the notification. As a result, the server does not log out the user.

When a user uses the **Disconnect** button on the authentication client to log out, the portal authentication server sends an unsolicited logout request message to the access device. The access device uses the source port in the logout request as the destination port in the logout ACK message. As a result, the portal authentication server can definitely receive the logout ACK message and log out the user.

Solution

1. Use the **display portal server** command to display the listening port of the portal authentication server configured on the access device.
2. Use the **portal server** command in system view to change the listening port number to the actual listening port of the portal authentication server.

Cannot log out portal users on the RADIUS server

Symptom

The access device uses the IMC server as the RADIUS server to perform identity authentication for portal users. You cannot log out the portal users on the RADIUS server.

Analysis

The IMC server uses session control packets to send disconnection requests to the access device. On the access device, the listening UDP port for session control packets is disabled by default. Therefore, the access device cannot receive the portal user logout requests from the RADIUS server.

Solution

On the access device, execute the **radius session-control enable** command in system view to enable the RADIUS session control function.

Users logged out by the access device still exist on the portal authentication server

Symptom

After you log out a portal user on the access device, the user still exists on the portal authentication server.

Analysis

When you execute the **portal delete-user** command on the access device to log out a user, the access device sends an unsolicited logout notification to the portal authentication server. If the BAS-IP or BAS-IPv6 address carried in the logout notification is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the logout notification. When sending of the logout notifications times out, the access device logs out the user. However, the portal authentication server does not receive the logout notification successfully, and therefore it regards the user is still online.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

Re-DHCP portal authenticated users cannot log in successfully

Symptom

The device performs re-DHCP portal authentication for users. A user enters the correct username and password, and the client successfully obtains the private and public IP addresses. However, the authentication result for the user is failure.

Analysis

When the access device detects that the client IP address is changed, it sends an unsolicited portal packet to notify of the IP change to the portal authentication server. The portal authentication server notifies of the authentication success only after it receives the IP change notification from both the access device and the client.

If the BAS-IP or BAS-IPv6 address carried in the portal notification packet is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the portal notification packet. As a result, the portal authentication server considers that the user has failed the authentication.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

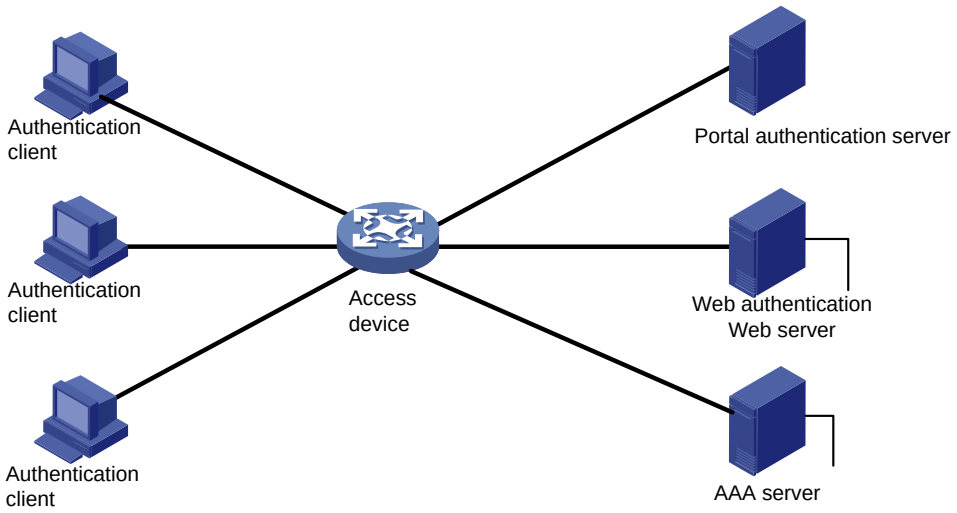
Configuring Web authentication

About Web authentication

Web authentication is deployed on Layer 2 interfaces of the access device to control user access to networks. The access device redirects unauthenticated users to the specified website. The users can access the resources on the website without authentication. If the users want to access other network resources, they must pass authentication.

Advantages of Web authentication



Web authentication has the following advantages:

- Allows users to perform authentication through webpages without installing client software.
- Provides ISPs with diversified management choices and extended functions. For example, the ISPs can place advertisements, provide community services, and publish information on the authentication page.

Web authentication system

A typical Web authentication system consists of the following basic components: authentication client, access device, Web server for Web authentication, portal authentication server, and AAA server.

Figure 1 Web authentication system using the local portal server

Authentication client

An authentication client is a Web browser that runs HTTP or HTTPS on the user endpoint.

Access device

An access device has the following functions:

- Redirects all user HTTP or HTTPS requests that do not match authentication-free rules to the Web authentication page before authentication.
- Interacts with the AAA server to complete authentication, authorization, and accounting. For more information about AAA, see "Configuring AAA."

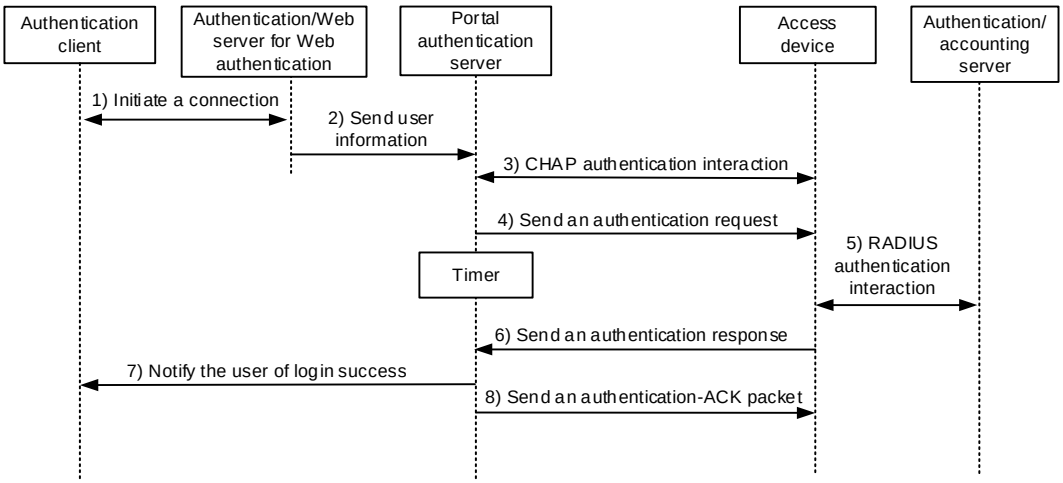
- Allows users that pass authentication to access authorized network resources.

Web server for Web authentication

A Web server pushes the Web authentication page to authentication clients and obtains user authentication information (username and password).

A Web server for Web authentication can be a local Web server or a remote Web server. A local Web server is usually integrated into the access device. A remote Web server is a portal Web server.

Portal authentication server



Web authentication uses a portal authentication server as the authentication server, which exchanges client authentication information with the access device.

AAA server

An AAA server interacts with the access device to implement user authentication, authorization, and accounting. A RADIUS server can perform authentication, authorization, and accounting for Web authentication users. An LDAP server can perform authentication for Web authentication users.

Web authentication process

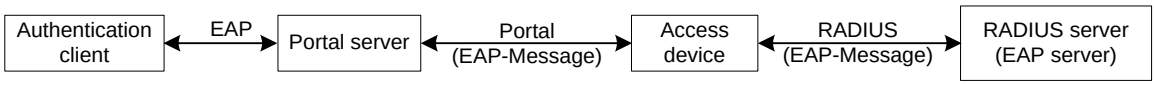
Figure 2 Web authentication process

The Web authentication process is as follows:

1. An unauthenticated user sends an HTTP or HTTPS request. When the access device receives the HTTP or HTTPS request on a Layer 2 Ethernet interface enabled with Web authentication, the request, it redirects the request to the Web authentication page. The user enters the username and password on the Web authentication page.

   If the user requests the Web authentication page or free Web resources, the access device permits the request. No Web authentication is performed.
2. The Web server for Web authentication sends the user information to the portal authentication.
3. The portal authentication server and the access device interact with each other to perform CHAP authentication. This step is skipped if PAP authentication is used. The authentication interaction type is determined by the portal authentication server.
4. The portal authentication sends an authentication request that contains the username and password of the user to the access device and starts a timer to wait for an authentication response.
5. The access device and the AAA server exchange RADIUS packets to authenticate the user.

6. The access device sends an authentication response indicating authentication success or failure to the portal authentication server.
7. The portal authentication server notifies the authentication result to the client.
8. If the user passes RADIUS authentication, the portal authentication server also sends an authentication-ACK packet to the access device.



Web authentication support for EAP

This feature is supported only when Web authentication uses a remote IMC portal authentication server and an iNode portal client.

Compared with username and password based authentication, digital certificate-based authentication ensures higher security.

The Extensible Authentication Protocol (EAP) supports several digital certificate-based authentication methods, for example, EAP-TLS. Working together with EAP, Web authentication can implement digital certificate-based user authentication.

Figure 3 Web authentication support for EAP protocol exchanges

As shown in Figure 3, the authentication client and the portal authentication server exchange EAP authentication packets. The portal authentication server and the access device exchange portal authentication packets that carry the EAP-Message attributes. The access device and the RADIUS server exchange RADIUS packets that carry the EAP-Message attributes. The RADIUS server that supports the EAP server function processes the EAP packets encapsulated in the EAP-Message attributes, and provides the EAP authentication result.

The access device does not process but only transports EAP-Message attributes between the portal authentication server and the RADIUS server. Therefore, the access device requires no additional configuration to support EAP authentication.

Web authentication support for VLAN assignment

Authorization VLAN

Web authentication uses VLANs authorized by the AAA server or the access device to control network resource access of authenticated users. The authorization VLAN information includes VLAN ID and VLAN name.

After a user passes Web authentication, the AAA server or the access device authorizes the user to access a VLAN. If the authorization VLAN does not exist, the access device first creates the VLAN and then assigns the user access interface as an untagged member to the VLAN. If the authorization VLAN already exists, the access device directly assigns the user access interface as an untagged member to the VLAN. Then, the user can access resources in the authorization VLAN.

Table 1 describes the way the access device handles authorization VLANs for Web authenticated users.

Table 1 VLAN manipulation

Port type	VLAN manipulation
• Access port • Trunk port • Hybrid port with MAC-based-VLAN disabled	The device assigns the port to the first authenticated user's authorization VLAN. The authorization VLAN becomes the PVID. All Web authentication users on the port must be assigned the same authorization VLAN. If a different authorization VLAN is assigned to a subsequent user, the user cannot pass Web authentication.

Port type	VLAN manipulation
Hybrid port with MAC-based VLAN enabled	The device maps the MAC address of each user to its own authorization VLAN regardless of whether the port is a tagged member. The PVID of the port does not change.

Auth-Fail VLAN

An Auth-Fail VLAN is a VLAN assigned to users who fail authentication. The Auth-Fail VLAN provides network resources such as the patch server, virus definitions server, client software server, and anti-virus software server to the users. The users can use these resources to upgrade their client software or other programs.

Web authentication supports Auth-Fail VLAN on an interface that performs MAC-based access control. If a user on the interface fails authentication, the access devices creates a MAC VLAN entry based on the MAC address of the user and adds the user to the Auth-Fail VLAN. Then, the user can access the authentication-free IP resources in the Auth-Fail VLAN. All HTTP or HTTPS requests to non-authentication-free IP resources will be redirected to the authentication page. If the user still fails authentication, the interface remains in the Auth-Fail VLAN. If the user passes authentication, the access device removes the interface from the Auth-Fail VLAN and assigns the interface to a VLAN as follows:

- If the authentication server assigns an authorization VLAN to the user, the access device assigns the interface to the authorization VLAN.
- If the authentication server does not assign an authorization VLAN to the user, the access device assigns the interface to the default VLAN.

Web authentication multi-VLAN mode

Web authentication supports single-VLAN or multi-VLAN mode on a port.

In multi-VLAN mode, the port forwards traffic from a user in different VLANs without reauthentication if the user has been authenticated and come online in any VLAN on the port.

In single-VLAN mode, the port reauthenticates an online user when traffic received from that user contains a VLAN tag different from the VLAN in which the user was authenticated. The authentication process differs depending on the MAC move setting in port security and the authorization VLAN assignment status, as follows:

- If no authorization VLAN has been assigned to the online user, the device first logs off the user and then reauthenticates the user in the new VLAN.
- If the online user has been assigned an authorization VLAN, the device handles the user depending on the MAC move setting in port security.
  - If MAC move is disabled in port security, the user cannot pass authentication and come online from the new VLAN until after it goes offline from the port.
  - If MAC move is enabled in port security, the user can pass authentication on the new VLAN and come online without having to first go offline from the port. After the user passes authentication on the new VLAN, the original authentication session of the user is deleted from the port.

  To enable the port security MAC move feature, use the **`port-security mac-move permit`** command.

Web authentication support for authorization ACLs

Web authentication uses ACLs authorized by the AAA server or the access device to control user access to network resources and limit user access rights. When a user passes authentication, the AAA server and the access device assigns an authorization ACL to the access interface of the user. The access device filters traffic from the user on the access interface according to the authorized ACL.

You must configure the authorization ACLs on the access device if you specify authorization ACLs on the authentication server.

To change the access control criteria for the user, you can specify a different authorization ACL on the authentication server or change rules in the authorization ACL on the access device.

The device supports the following types of authorization ACLs:

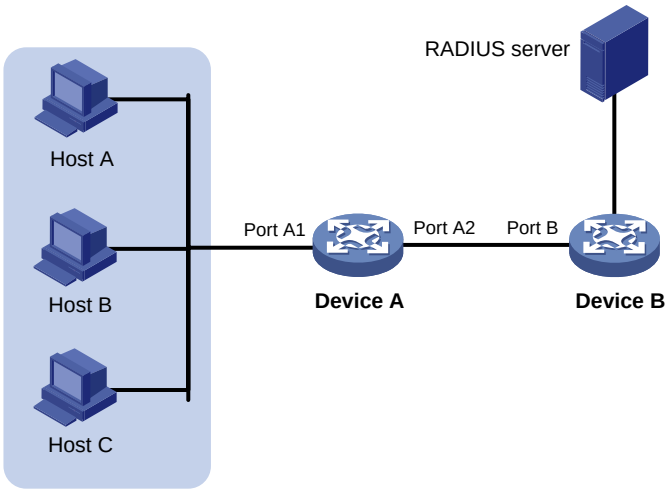
- Basic ACLs (ACL 2000 to ACL 2999).
- Advanced ACLs (ACL 3000 to ACL 3999).
- Layer 2 ACLs (ACL 4000 to ACL 4999).

For an authorization ACL to take effect, make sure the ACL exists and has ACL rules excluding rules configured with the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword. For more information about ACL rules, see ACL commands in *ACL and QoS Command Reference*.

Restrictions and guidelines: Web authentication configuration

When you configure Web authentication, follow these restrictions and guidelines:

- Web authentication cannot be configured in conjunction with the guest, Auth-Fail, and critical VLAN settings of 802.1X authentication.
- Web authentication cannot be configured in conjunction with the guest and critical VLAN settings of MAC authentication.
- Auth-Fail VLAN is mutually exclusive with the port security preauthentication domain feature.



To redirect HTTPS requests for unauthenticated users correctly, make sure the packet incoming VLANs have Layer 3 interfaces (VLAN interfaces) configured.

To access the resources in the authorization VLAN or Auth-Fail VLAN, a user must update the IP address of the client after being assigned to the authorization VLAN or Auth-Fail VLAN.

As a best practice, perform Web authentication on users directly connected to the device. As shown in Figure 4, if you enable Web authentication on Port B to authenticate non-directly connected users (the hosts), you must follow these restrictions and guidelines:

- If the RADIUS server assigns an authorization VLAN to the users, make sure the following conditions are met:
  - The link between Device A and Device B is a trunk link.
  - The PVIDs of Port A1 and Port B are the same as the authorization VLAN ID.
- If the RADIUS server does not assign an authorization VLAN to the users, make sure the PVIDs of Port A1 and Port B are the same.

Figure 4 Web authentication for non-directly connected users

Web authentication tasks at a glance

To configure Web authentication, perform the following tasks:

1. Configuring a remote Web authentication service

   Perform this task if a remote Web server is deployed on the network for Web authentication.

   a. Configuring a remote portal authentication server
   b. Configuring a remote Web server for Web authentication
   c. Obtaining user information from ARP or ND entries
2. Configuring a local Web authentication service

   Perform this task if the device is used as the local Web server for Web authentication.

   a. Configuring a local Web server for Web authentication
   b. Configuring a local portal service
3. Enabling Web authentication
4. (Optional.) Specifying a Web authentication domain
5. (Optional.) Setting the redirection wait time
6. (Optional.) Configuring the aging timer for temporary MAC address entries
7. (Optional.) Configuring Web authentication-free subnets or host names
8. (Optional.) Setting the maximum number of Web authentication users
9. (Optional.) Configuring online Web authentication user detection
10. (Optional.) Enabling online detection bypass for Web authentication users
11. (Optional.) Configuring an Auth-Fail VLAN
12. (Optional.) Configuring Web authentication to support Web proxy
13. Applying a portal MAC binding server for Web authentication

    This task is required to perform the MAC-based quick authentication.
14. (Optional.) Enabling Web authentication user logging

Prerequisites for Web authentication

The device supports two methods for Web authentication, which are local authentication and RADIUS authentication.

To use the RADIUS authentication method, you must complete the following tasks:

- Install a RADIUS server and configure the RADIUS server properly.
- Make sure the authentication client, the access device, and the RADIUS server can reach each other.
- Configure user accounts on the RADIUS server and configure the RADIUS client information on the access device.

To use the local authentication method, you must configure local users on the access device.

For more information about RADIUS clients and local users, see "Configuring AAA."

Configuring a remote Web server for Web authentication

About this task

In the view of a remote Web server, you can configure the Web server IP address, redirection URL, and the parameters to be carried in the redirection URL.

By default, the state of the Web server specified by the redirection URL is always **active**. The device cannot obtain the real server state. When primary and secondary Web servers are deployed for continuous authentication service, the device needs to quickly obtain the primary server's state changes to perform primary/secondary switchovers accordingly.

You can associate the Web server with a track entry that is associated with NQA, so the device can periodically detect the reachability of the server through NQA.

- The Track module changes the state of the track entry according to the NQA detection result. The device changes the state of the Web server according to the state of the track entry.
- In this way, if NQA detects that the Web server becomes reachable, the device will set the server state to active. If NQA detects that the Web server becomes unreachable, the device will set the server state to inactive.

For more information about the Track configuration, see *High Availability Configuration Guide*.

Restrictions and guidelines

To deploy both primary and secondary Web servers, you must associate the primary Web server with a track entry to monitor the reachability status of the server. Otherwise, the device cannot sense the reachability state changes of the primary server to perform primary/secondary switchovers.

The NQA detection for server reachability is performed according to the **nqa schedule** configuration, which schedules the NQA operation associated with the track entry. Configure the NQA operation time and other detection parameters as needed.

Procedure

1. Enter system view.

   system-view

2. Create a remote Web server for Web authentication and enter Web authentication remote Web server view.

   web-auth remote server *server-name*

   The local and remote Web servers cannot use the same name.

3. Specify the IP address of the remote Web server for Web authentication.

   IPv4:

   ip *ipv4-address*

IPv6:

ipv6 *ipv6-address*

By default, no IP address is specified for the remote Web server for Web authentication.

The IP address of the remote Web server must be the IP address of the portal Web server used for Web authentication.

You can configure one IPv4 address and one IPv6 address for a remote Web server.

4. Configure the redirection URL of the remote Web server for Web authentication.

   url *url-string* [**track** *track-entry-number*]

   By default, no redirection URL is specified for a Web server for Web authentication.

   To provide Web authentication pages for both IPv4 and IPv6 Web authentication users, configure the redirection URL to carry the domain name of the Web server. For example: **https://example.com**, where **example.com** is the domain name of the Web server.

   A Web server can be associated with only one track entry. If you associate Track with the Web server multiple times, the most recent configuration takes effect.

5. (Optional.) Add parameters to the redirection URL of the remote Web server.

   url-parameter *parameter-name* { **original-url** | **source-address** | **source-mac** | **value** *expression* }

   By default, no parameters are added to the redirection URL of a Web server.

   You must use the URL parameter name supported by the Web browser. Different Web browsers support different URL parameter names.

6. (Optional.) Configure the unescaped special characters in the Web authentication URL redirected to users.

   url-unescape-chars *character-string*

   By default, the device escapes all special characters in the Web authentication URL redirected to users.

7. (Optional.) Configure the Web server to support the Oasis platform.

   server-type oauth

   By default, a Web authentication server does not support the Oasis platform.

   To use an Oasis server as a Web authentication server, execute this command to support the Oasis platform.

Configuring a remote portal authentication server

For information about configuring a remote portal authentication server, see "Configuring portal authentication."

Obtaining user information from ARP or ND entries

About this task

By default, the device obtains user information required by the portal authentication server from MIB entries. However, MIB entries do not contain the Layer 2 user information (such as MAC address and Layer 2 access interface) required for Web authentication. Users will fail the Web authentication as a result.

To resolve this issue, configure the device to obtain user information from ARP or ND entries.

Procedure

1. Enter system view.

   system-view

2. Configure the device to obtain portal user information from ARP or ND entries.

   portal access-info trust { **arp** | **nd** }

   By default, the device obtains user information from FIB entries.

   For more information about the configuration, see "Configuring portal authentication."

Configuring a local Web server for Web authentication

Restrictions and guidelines

Specify the IP address of a Layer 3 interface on the device that is routable to the Web client as the listening IP address of the local Web server for Web authentication. As a best practice, use the IP address of a loopback interface. A loopback interface has the following advantages:

- The status of a loopback interface is stable. There will be no authentication page access failures caused by interface failures.
- A loopback interface does not forward received packets to any networks, avoiding impact on system performances when there are many network access requests.

Procedure

1. Enter system view.

   system-view

2. Create a local Web server for Web authentication and enter Web authentication local Web server view.

   web-auth server *server-name*

   The local and remote Web servers cannot use the same name.

3. Specify the IP address and port number of the local Web server.

   IPv4:

   ip *ipv4-address* **port** *port-number*

   IPv6:

   ipv6 *ipv6-address* **port** *port-number*

   The port number of the local Web server must be the same as the listening port number of the local portal Web service.

   You can configure one IPv4 address and one IPv6 address for a local Web server.

4. Specify the redirection URL for the local Web server.

   url *url-string*

   By default, no redirection URL is specified for a Web server for Web authentication.

   The redirection URL must start with **http://** or **https://**. The IP address and port number in the specified redirection URL must be the same as those of the local Web server for Web authentication.

   To provide Web authentication pages for both IPv4 and IPv6 Web authentication users, configure the redirection URL to carry the domain name of the Web server.

5. (Optional.) Add parameters to the redirection URL of the local Web server.

   url-parameter *parameter-name* { **original-url** | **source-address** | **source-mac** | **value** *expression* }

By default, no parameters are added to the redirection URL of a Web server.

You must use the URL parameter name supported by the Web browser. Different Web browsers support different URL parameter names.

6. (Optional.) Configure the unescaped special characters in the Web authentication URL redirected to users.

   url-unescape-chars *character-string*

   By default, the device escapes all special characters in the Web authentication URL redirected to users.

7. (Optional.) Configure the Web server to support the Oasis platform.

   server-type oauth

   By default, a Web authentication server does not support the Oasis platform.

   To use an Oasis server as a Web authentication server, execute this command to support the Oasis platform.

Configuring a local portal service

For information about the local portal service configuration, see "Configuring portal authentication."

Enabling Web authentication

Restrictions and guidelines

For Web authentication to operate correctly, do not enable port security or configure the port security mode on the Layer 2 interface enabled with Web authentication. For more information about port security, see "Configuring port security."

To deploy both primary and secondary Web servers, follow these restrictions and guidelines:

- Only a remote Web server can be used as the primary Web server. A remote or local Web server can be used as the secondary Web server.
- Associate the primary Web server with a track entry (by using the **url** *url-string* **track** *track-entry-number* command) to monitor the reachability status of the server. Otherwise, the device cannot sense the reachability state changes of the primary server to perform primary/secondary switchovers.

The default HTTPS redirect listening port number on the device is 6654. To change the HTTPS redirect listening port number, see HTTP redirect configuration in *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable Web authentication and specify Web servers for Web authentication.

   web-auth enable apply server *primary-server-name* [**secondary-server** *secondary-server-name*]

   By default, Web authentication is disabled.

Specifying a Web authentication domain

About this task

You can specify different authentication domains for Web authentication users on different interfaces. After you specify a Web authentication domain on an interface, the device uses the authentication domain for AAA of all Web authentication users on the interface, ignoring the domain names carried in the usernames.

The device selects the authentication domain for a Web authentication user on an interface in this order:

1. The authentication domain specified for the interface.
2. The authentication domain carried in the username.
3. The system default authentication domain.
4. The ISP domain configured to accommodate users assigned to nonexistent domains.

If the selected domain does not exist on the device, user authentication fails. For information about ISP domains, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify an authentication domain for Web authentication users on the interface.

   web-auth domain *domain-name*

   By default, no authentication domain is specified for Web authentication users.

Setting the redirection wait time

About this task

The redirection wait time determines the length of time that the device waits to redirect a user to the specified webpage after the user passes Web authentication.

You need to change the redirection wait time in some scenarios, for example, when a user needs to update the client IP address after passing local Web authentication. To ensure that the specified webpage can be successfully opened, set the redirection wait time to be greater than the time that the user takes to update the IP address of the client.

Procedure

1. Enter system view.

   system-view
2. Enter Web authentication local Web server view.

   web-auth server *server-name*
3. Set the redirection wait time.

   redirect-wait-time *period*

   By default, the redirection wait time for authenticated users is 5 seconds.

Configuring the aging timer for temporary MAC address entries

About this task

If Web authentication is enabled, the device generates a temporary MAC address entry when it detects traffic from a user for the first time. The entry records the MAC address, access interface, and VLAN ID of the user, as well as the aging time of the entry.

The aging timer works as follows:

- If the user does not initiate authentication when the aging timer expires, the device deletes the temporary entry.
- If the user passes authentication before the aging timer expires, the device deletes the aging timer and records online information for the Web authentication user.
- If the user fails authentication before the aging timer expires and an Auth-Fail VLAN is specified for Web authentication, the device binds the MAC address of the user to the Auth-Fail VLAN and reset the aging timer. If the user still fails authentication when the aging timer expires, the device deletes the temporary entry for the user.

Restrictions and guidelines

As a best practice, change the aging timer to a bigger value in the following cases:
